So the question is pertinent, Will the consumer willingly pay it? If he will, no one will be better pleased than the operator. Higher wages for his men, shorter hours, compensation, liberal payments to the state for roads and hospitals are all pleasing to him if the consumer is willing. The fight is made by the operator, not because he does not want the miner, the day laborer and the state to benefit, but because he doubts whether the consumer is willing to pay for the costs which too often he is ready enough to require. In short, the complacent public is willing enough to give its orders to the waiter, but it is singularly quiet when it becomes time to settle the score. Cheerful it always is in ordering the best on the bill—taxes, compensations, shorter hours, better pay—but it scans with a suspicious eye the lengthy items on the score when the time arrives at which to make payment, quite forgetting the prodigal menu it has ordered and enjoyed.

Pennsylvania Coal and the Last Navy Contracts

The statement in the latest report of the paymaster-general of the navy that the department saved from 20 to 25c. per ton on fuel last year is so unusual that it is attracting notice outside the coal industry. While 1914-15 was a dull season, that of itself would not account for so significant a margin. The answer is that for the first time, in June, 1914, coal mined in Pennsylvania was recognized as strongly competing for an order which had come to be regarded as peculiarly a perquisite of coals loaded at Norfolk and Newport News. Not only were Pocahontas and New River favored, but no other coals, Big Vein Georges Creek alone excepted, were considered on anything like a parallel basis. Armored boats with their high-speed requirements seemed absolutely dependent on West Virginia steam coals of the highest grade; and further, it was the opinion that only at Hampton Roads and Curtis Bay could naval colliers load safely and get suitable dispatch. That was the general impression of naval men, and that as it proved was the general expectation of the Southern agencies when bids were submitted in June, 1914.

Thirteen of the 19 Hampton Roads shippers who bid (practically all Pocahontas and New River operations were represented) submitted $2.90 f.o.b., the six other proposals ranging from $2.88 to $2.80, the latter being the lowest Hampton Roads price named. This was when $2.65 was a high price for spot coal and the market was as near demoralization as at any time since 1909. Of course the bids were for the year ending June 30, 1915, but it must have been with some sense of relief that the authorities turned to Pennsylvania tenders ranging from $2.42 to $2.70 f.o.b. Philadelphia. An award of 200,000 tons at $2.65 was made on a B-vein Cambria County coal that had been thoroughly tested in ships of differing types, and so far as is known the coal proved satisfactory throughout the year. On the 200,000 tons, at least, there was a nominal saving of 35c. per ton as compared with most of the Pocahontas and New River submitted at the same time, and he would be a hard critic who would say there was that difference in efficiency. And it was conclusively shown that the largest colliers could be given adequate dispatch at Philadelphia.

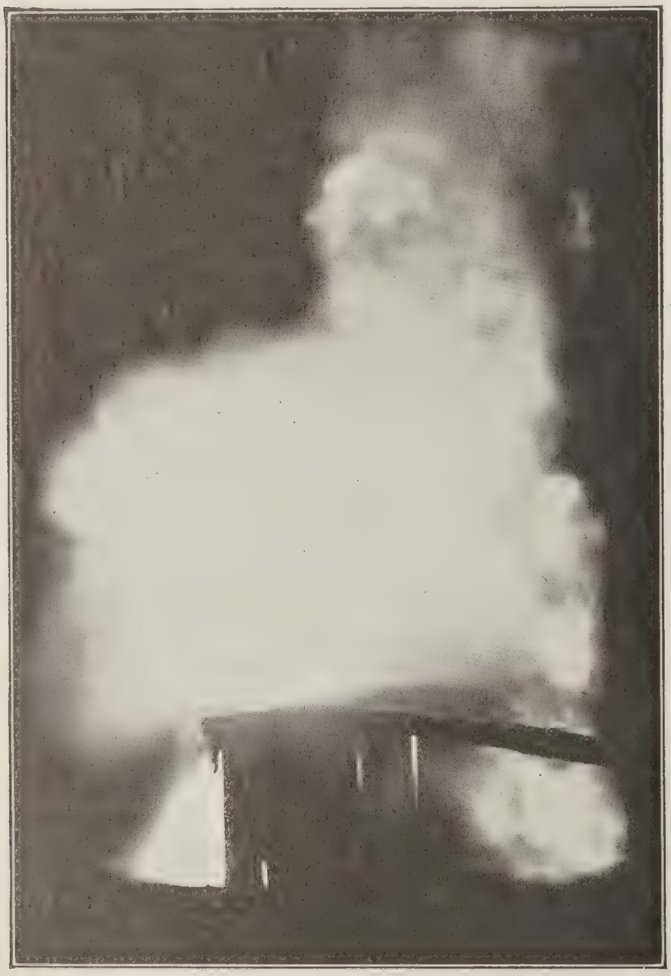
Moreover, a year later, with Hampton Roads coals fairly firm at $2.75 to $2.85, the same contract, this time for 400,000 tons, was placed on Pocahontas coal at $2.60, or 5c. less than the department paid for Pennsylvania coal in 1914. This not only reflected a determination on the part of West Virginia operators to stay in competition, but as emphasized again in September in the case of the Panama R.R. (see contract No. 1327, Vol. 8, pp. 367, 446, 532), it made plain that the Government's former dependence on Hampton Roads was now a matter of price.

Sociological Department

Indiana State First-Aid Meet

SYNOPSIS—The union and operators in Indiana combined to make the first-aid meet at Bicknell a success. The spectacular explosions, inexpensively arranged, exhibited more forcibly than ever the dangers of coal dust. Only full-team events were contested. A team of boys, the Bureau of Mines instructors and the Kiltie band received special honors.

Marking a rare occasion in the history of the coal industry in which operators and miners worked together in a cause of mutual benefit, Indiana's State-Wide First-Aid Meet held at Bicknell, Saturday, Oct. 30, set a mark that will be difficult for other cities of the Hoosier State to surpass when holding future meets. Interest throughout the coal fields of Indiana was at its maximum, and Bicknell was crowded throughout the day with the throngs of visitors.



EXPLOSION OF COAL DUST AT NIGHT IN TEST GALLERY ERECTED AT BICKNELL

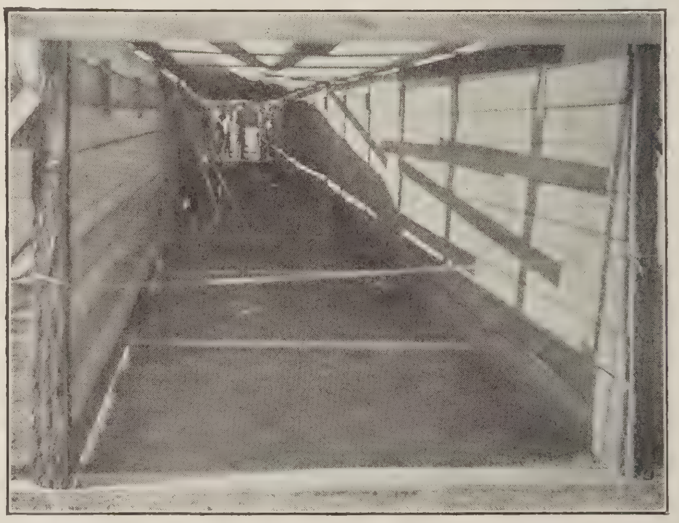
Bicknell celebrated the meet by declaring Saturday a holiday for the little city. The citizens did everything in their power to make the stay of the visitors as pleasurable and profitable as possible. At 10 a.m. the program opened with the state-championship soccer-football game between Dugger and Bicknell, the latter team winning 2 to 0. Others took an automobile tour of the mining properties around Bicknell. The new plant of the American Mining Co., which began operations in April, attracted much attention. The principal owners of this $1,500,000 enterprise are the Zellars and McClellans, and it is stated that the property can be made to produce 4,000 tons of coal for every working day of the year for a period of 25 to 30 yr. The construction and equipment of this plant are said to be the "last word" in mine engineering.

In the same field and a few miles west of Bicknell is Bruceville, which also was visited. The Oliphant-Wasson company, composed principally of Vincennes capitalists, is erecting another plant which it is said will be as modern as the American. The Indian Creek Coal Co. has a large plant near the American, but is an older concern. This company also owns several thousand acres of coal lands and has an immense output. Not long ago it broke all Indiana records for a day's work by loading 3,500 cars of coal in a working day. In addition to these mines, the trip included visits to the Knox, the Bicknell and the Tecumseh coal companies' properties. Reports of the Indiana state geologist state that Knox County has a larger acreage of mineable coal than any other in the state.

During these entertainments the first-aid teams reported at the Commercial Hotel, the headquarters of the meet, and at 1:15 p.m., the lengthy parade, headed by the Kiltie Bagpipers, was formed. The procession was made up of first-aid teams and visitors, all occupying automobiles lent by the Bicknell citizens. The J. K. Dering band, of the J. K. Dering Coal Co., of Clinton, also furnished music.

CONVINCING EXHIBITS OF COAL-DUST DANGERS

Arriving at the field the first event of interest was a coal-dust explosion demonstration under the direction of the Bureau of Mines. The first demonstration was fired by Job Freeman, president of the Glen Ayr Coal Co., of Terre Haute. The gallery being built only for use during the demonstration was constructed of a light framework of brattice boards covered with a roof of brattice cloth. The cannon was made under Dr. August F. Knoefel's orders. He is in charge of the first-aid department of the Indiana Bituminous Coal Operators' Association. The lining of the cannon consisted of a 7-in. steel shaft 48 in. long. A hole was bored in it 1¾ in. in diameter and 22 in. long.



INTERIOR OF GALLERY; WALLS ARE OF BOARDS AND ROOF OF BRATTICE CLOTH

This lining was placed in a 10-in. pipe and the space filled with a half-and-half mixture of concrete. Each shot was stemmed with clay well tamped. After being mounted on a platform it was loaded with 1 lb. of black powder, and 5 lb. of coal dust was scattered for a distance of 10 ft. Flames extended for more than 50 ft. along the gallery and part of the brattice-cloth top was torn loose by the force of the explosion. This small demonstration well illustrated what "bug dust" may do if drawn into the flame of a blownout shot.

Considering that the "room" was thoroughly sprinkled with water within 10 ft. of the "face," the men from the Bureau of Mines considered that the exhibit was unusually valuable as a demonstration of the possibilities of causing an explosion by the use of ordinary blasting powder.

In the second demonstration a permissible explosive was loaded into the cannon and tamped with clay. In addition to the coal dust scattered in front of the cannon, shelves were placed in the gallery 5 ft. apart. These were attached to the cannon by a wire so that the recoil would pull the shelves down, scattering the dust throughout the gallery. There was no explosion nor any flame following this demonstration, and the only effect of the discharge was a stirring up of the dust, as the shelves, by which it was supported, collapsed.

FIRST-AID TEAMS AWAITING THE INSPECTION OF THE JUDGES

A MORE VIOLENT EXPLOSION AFTER DARK

At 5 p.m. a third explosion bigger than any which preceded it was staged. On a platform 12 ft. long, 8 lb. of coal dust was scattered in front of the cannon, which was loaded with black powder instead of permissible explosive. On its discharge by William Diamond, international statistician of the United Mine Workers of America, of Indianapolis, the gallery became filled with flame, and portions of it were burned and torn loose by the force of the explosion.

The first-aid contest started at 2 p.m. There were 27 entries, but of this number only 22 presented themselves upon the field. Harry Snyder, of Brazil, acted as announcer and read the problems selected by the judges. Dr. A. F. Knoefel acted as chief judge and was assisted by Drs. M. R. Coombs, R. L. Woodward, C. N. Coombs, J. H. Weinstein, F. H. Carmichael, J. T. Freed, A. M. Mitchell, W. F. Willien, O. O. Alexander and Rudolph Duenweg. From a list of nine problems the judges selected the following five for the contest:

A driver falls under a car, sustaining a compound fracture of the right forearm 4 in. above the wrist, causing slight bleeding, and also a severe laceration over the right kneecap with practically no bleeding. Treat.

A fall of slate on an entry causes a trolley wire to fall on the back of the right shoulder of a motorman, severely burning him and rendering him unconscious. Dress and treat for electrical shock. Transport 50 ft. on an improvised stretcher.

A fireboss in making his rounds runs into an unexpected pocket of gas which is set off by the naked lamp that he is wearing. He sustains burns of his entire body above the waist line without losing consciousness. Treat.

A trip-rider is knocked off his motor and run over by an empty car. He sustains a compound fracture of the thigh 4 in. above the left knee, which causes a severe hemorrhage. In addition he has a simple fracture in the middle of the right leg, but still retains consciousness. Treat.

A cager is caught between the cage and the brow timbers. His right ear is severely lacerated, and the sixth, seventh, and eighth ribs on the right side of the chest are fractured. A laceration of the abdominal wall just above the left hip also demands attention. Treat.

REGULATIONS GOVERNING CONDUCT OF MEET

The systematic manner in which the meet was conducted was due largely to the rules set down for the contests, especially in reference to rule No. 24, in which the judges are instructed what to discount for the application of a dressing to the wrong limb or wrong side of the body. In every contest some team dresses the wrong limb, and judges use their own discretion as to the amount of penalty to be imposed. By having a set discount, this uncertainty was avoided.

The following discounts, as adopted by the American Mine Safety Association, were made of force in this meet:

Not doing the most important thing first,	6
Failure of captain to command properly,	1
Slowness in work and lack of attention,	2
Failure to entirely cover the wound or being unable to give location of injury,	4
Ineffective artificial respiration,	11
Splints improperly padded or applied,	6
Tight, loose or improperly applied bandage,	5
Insecure or granny knot,	4
Unclean first-aid material,	3
Failure to have on hand sufficient and proper material to complete a dressing,	3
Lack of neatness,	2
Awkward handling of patient,	4
Assistance afforded by patient,	3
Tourniquet improperly applied,	7
Failure to stop bleeding,	8
Not treating shock,	5
Failure to be aseptic,	7
Improper treatment,	12
Omitting to control hemorrhage before applying tourniquet,	7
	100

SOME OF THE SUPPLEMENTARY RULES

The following supplemental rules governing the meet are of interest:

All problems will definitely locate the injury or injuries. All events offered will be team events. In problems requiring the carrying of the patient on a stretcher a designated number of feet, this can be accomplished by carrying the patient half the required distance from the working place, the other half to be covered by returning the patient to the original position. It will only be necessary to treat for active bleeding where the problems state "active hemorrhage," "bright red blood," "bleeding," "profuse bleeding," or similar terms. The Schaefer method will be the approved plan of promoting artificial respiration unless the injury precludes its use. All events will start at the sound of a gong or horn. It is suggested that each team be provided with two pieces of canvas, one to place under the patient and the other upon which the dressings may be laid. The winners will not be announced until at the evening program, when the prizes will be distributed.

BOY TEAM A NEW FEATURE IN MIDDLE WEST

The field selected for the contests proved to be ideal and was thronged with more than 3,000 people. Frequently the crowd gathered in so close around the teams that it was necessary to stop the meet until the people were driven back. They gathered in particular around the Powellettes, a team of boys who had been trained by Foreman G. T. Powell, of Mine Rescue car No. 3. It was composed of Captain Walter Clark, 15 yr. old; John Robertson, 16 yr.; Robert Jones, 16 yr.; Ralph Foster, 15 yr.; Sam Wilson, 16 yr.; and patient, 14 yr. The youngsters carried off the nineteenth prize and a special award

FOREMAN G. T. POWELL AND HIS CLEVER TEAM OF POWELLETTES of six pocketknives for the team with the youngest members. It is hoped that next year more Powellettes will be in line.

Following the fifth problem for teams, the final coal-dust explosion was demonstrated, and the recorders in figuring out the percentages found that seven teams were tied for places, which were worked off after the explosion, keeping the teams on the field until after dark. Meanwhile the evening's program was started in the business center of town, where motion pictures of the anthracite fields of Pennsylvania and the zinc mines in New Jersey were shown. These pictures, obtained from the Bureau of Mines, attracted hundreds of people to the streets, all gathering around the screen, which was hung from the side of one of the buildings. These were again thrown on the screen after the conclusion of the evening program.

UNION AND OPERATORS CO-OPERATED IN MEET

At 7:30 p.m. the hall in which the prizes were awarded was opened, and in a short time it was packed, even the standing room being fully occupied. Dr. Knoefel, who had charge of the meet and was chief judge in the contests and is a representative of the first-aid department of the Indiana Bituminous Coal Operators' Association, and of the American Red Cross, and also an ex-president of the American Mine Safety Association, opened the meeting by introducing Mayor Tyler Lawton, who expressed the appreciation of the little city for the number of visitors attending the meet, after which he acted as the presiding officer, introducing all the speakers. They dwelt upon the fact that the operators and miners, together with Bicknell business men, worked in complete harmony in preparing for the meet. Representatives of both the operators and miners spoke on this feature, declaring it to be a signal success for both.

OLIPHANT-WASSON CO., WINNERS OF FIRST PRIZE

Left to right—Standing: Robert B. Logan, Dan E. Ellis and Glen Oliphant. Sitting: Paul Thompson, Ed. Livingston, Captain; John Mosby

The speakers were William Diamond, international statistician of the United Mine Workers, Indianapolis; Edgar A. Perkins, chairman of the Industrial Board of Indiana, Indianapolis; D. Harrington, mining engineer of the Bureau of Mines, Pittsburgh; William Kitch, secretary of district 11, United Mine Workers of America, Terre Haute; John C. Wright, deputy mine inspector of Indiana, Boonville; Robert J. Smith, president of the Deep Vein Coal Co., representing the Indiana Bituminous Coal Operators' Association, Terre Haute; and Dr. A. F. Knoefel.

Dr. Knoefel then awarded the prizes. Instead of starting with the first prize, he presented the low award first, so that the interest instead of declining increased. The winner of the state championship was team No. 2, of the Oliphant-Wasson Coal Co., of Boonville, headed by Captain Edward Livingston. The team received the state championship cup donated by the Indiana Coal Operators' Reciprocal Organization, of Terre Haute, six bronze medals from the American Red Cross, six bronze medals from the National Safety Council and six bronze medals from the meet committee. All teams competing received medals announcing their participation in the contest.

CHAMPIONS HAD ONLY A WEEK'S PRACTICE

The championship team did not begin work for the meet until the Monday preceding the day on which the meet was held. On that night they took their first lesson under Dr. Knoefel and were trained by him in the few days intervening. None of them had ever taken part in first-aid meets before or even done any of the work, which makes their victory all the more remarkable. Other prizes awarded were as follows: Special grand prize, the Bicknell loving cup, awarded to the team most proficient in the improvising of dressings and in making use of dressings that were thus improvised—won by team No. 2, of the Tecumseh Coal and Mining Co., of Bicknell, Robert Collins, captain. Second prize, five Red Cross certificates, medals from the meet and one coffee percolator donated by the General Electric Co.—won by the Knox Coal Company, of Bicknell, Andrew Henderson, captain. There were 20 other prizes given, so every team received some form of recognition for its enterprise and efficiency.

The averages of the teams as reported by the recorders were as follows:

Name	Captain	Location	Av.
Oliphant-Wasson No. 2	Ed Livingston	Bruceville	95.0
Knox Coal Co. No. 1	Andrew Henderson	Bicknell	93.8
Green Valley Coal Co.	Homer Baker	Jasonville	93.4
Jackson Hill No. 2	J. H. Needhammer	Sullivan	93.2
Miami Coal Co. No. 1	E. Lapworth	Clinton	92.8
Miami Coal Co. No. 2	John Stevely	Clinton	92.8
Indian Creek No. 1	John Cheyne	Bicknell	92.8
Vandalia Mine No. 15	William Keller	Cass	92.6
American Coal Co. No. 2	Michael New	Bicknell	92.4
J. Wooley Coal Co. No. 2	James McNair	Paxton	92.4
Vandalia Mine No. 82	George Murdock	Terre Haute	92.0
Tecumseh Coal Co. No. 2	Robert Collins	Bicknell	91.8
J. K. Dering Coal Co.	Scott Amour	Clinton	91.6
Vandalia Mine No. 9	Charles Doidge	Linton	91.0
American Coal Co. No. 1	Rollie Cook	Bicknell	90.0
Vandalia Mine No. 10, local	James Edwards	Dugger	89.6
Knox Coal Co. No. 2	Walter Pollock	Bicknell	88.8
J. Wooley Coal Co. No. 1	Robert Lilly	Paxton	88.8
Calora Coal Co.	E. R. Devilin	Jasonville	88.4
Powellettes	Walter Clark	Bicknell	88.2
Richards Lower Vein No. 1	Richard Owens	Terre Haute	86.0
Old Bicknell Mine	Don Hoover	Bicknell	85.2

As the name and the prize of each team were called out and the captains went forward to receive their prizes, the audience called on the successful contestants for speeches, and many were forced to respond. After the regular prizes had been awarded Dr. Knoefel called upon five of the Bureau of Mines men—H. I. Smith, G. T. Powell, W. W. Fleming, James Fleming and J. A. Hanraty—and presented them with five medals made in the form of watch fobs as an expression of appreciation from the Bicknell business men and the operators and miners. Those given Mr. Smith and Mr. Powell were of gold and the others bronze.

Then it was found that there was yet a set of meet medals and Dr. Knoefel called for suggestions from the audience and was urged to "Give 'em to the Kilties!" The call was so unanimous that the Kilties Bagpipers were called to the front amid the cheers of the audience and the medals were pinned upon their Scottish "claes." This brought to a close an unusually successful meet.

Coöperating in holding the meet were the merchants of Bicknell, the American Red Cross, the Bureau of Mines, the National Safety Council, the first-aid department of the Indiana Bituminous Coal Operators' Association and the Indiana mine-inspection department. It was held under the auspices of the Indian Creek, Oliphant-Wasson, American, Knox, Bicknell and Tecumseh coal companies and local unions Nos. 1,634 of Vincennes, 1,368 of Bruceville, 884 of Bicknell, 1,698 of Bicknell and 2,411 of Bicknell. The officers at the head were President John Rodgers, Secretary William Bogle and Treasurer Andrew Henderson, all of Bicknell.

Among those in attendance were Mike Scollard, chief inspector of Indiana, and all his five assistant deputies—J. C. Wright, of Boonville; Edward Church, of Sullivan; William Edwards, of Clinton; Joseph Fennell, of Linton, and Charles Fox, of Terre Haute, who is also president of the Indiana Federation of Labor. Ed. Wallace, editor of the "United Mine Workers' Journal," was also present to report the meet for his publication.

Discussion by Readers

Store Checks vs. Thrift

Letter No. 5—Yes, as *Coal Age* says in its Foreword, Oct. 16, page 619, "We know in our hearts that thrifty men make the best employees, because they buy homes and become settled citizens." In the long run they are the best workmen in the mine. There is not a man who has had any experience with mine labor and whose opinion is worth knowing that would say otherwise.

I fear, however, that few such men will respond to the invitation of *Coal Age* to express their opinions on this subject. Although the general opinion among mining men is unanimous, the matter is little talked about among themselves, since it is well understood that no mining concern that runs a store would tolerate any criticism on the part of an employee. Whatever their private opinions, all mine officials are expected to make their men realize, in some subtle but effective way, that the man who spends most at the company store will receive more favors than the one who buys elsewhere.

Rating Employees by Their Purchases

It is a matter of regret that in some instances mine operators and managers have gone through the list of their employees for the purpose of comparing the purchases made by the different families, in order to arrive at an estimate of the amount of merchandise that they consider each particular family ought to buy, using as a standard of comparison the purchases made by the best customer in the store.

In this estimation no account was taken of the fact that a man has a wasteful wife or housekeeper who purchases 50 or 100 per cent. more goods than she actually needs. The amount that other families of the same size might be expected to purchase was fixed by this unholy example of the wasteful housekeeper. The closer a man's purchases came to the figure thus affixed to his account the better he would fare in the allotment of places and jobs in the mine. I am glad to say that such practices have few advocates. Mine operators today realize that the effort to influence a man in respect to the amount of goods he should purchase for his family does not foster thrift.

There are numerous examples of superintendents and foremen, however, who hold their positions mainly because they are good trade-getters. To some extent their mining ability is considered second to that of hiring and keeping men who patronize the company store. The results of such a policy are plainly evident in a mine run on this plan. One can readily pick out from among the workmen those who are the best buyers by the positions they hold in the mine. Discipline in such mines is lax, and rules and regulations relating to safety are often poorly observed. Much time, labor and material are wasted, because everyone does nearly as he pleases. This careless disregard of mine regulations is engendered by the feeling that a man's place in the mine is secure as long as he has a good store account.

One can readily judge of the conditions in a mine where the mine foreman is obliged to keep his eye on the store and nurse its interests, subordinating the mine work to the store sales. Indeed, it is a safe guess that the cost of producing coal in the mine is proportionately high as the store sales exceed a normal average. Conditions in the store are said to be good when, say, 50 per cent. of the payroll is issued in checks, which is quite generally the case when the mine is running full time. When work in the mine falls below three days a week, the percentage of store checks deducted from the payroll is increased.

A mine employing, say, 100 men and working four days and producing 3,000 tons a week can easily afford to lose 3c. a ton in the cost of production if 40 per cent. of the men's wages goes into the store. An estimate shows that when the mine works three days a week the store checks must total 60 per cent. of the payroll, or 50 per cent. when the mine works less than three days in the week. I have known cases where 5c. a ton could be lost in the cost of production without showing a deficit when 55 per cent. of the payroll was entered as store checks. This of course does not include the rent on company houses.

Miners Not Encouraged To Buy Homes

I had not intended to say anything about miners' houses, but it seems necessary to explain here why so few miners buy homes for themselves. There are three principal reasons for this: First, to buy or build a house, it becomes necessary for a man to economize, which means that he spends less money in the store as well as purchases his goods where they are cheapest. Neither of these conditions, however, is in line with the policy of the company. Secondly, when a man has bought or built a house, he stops paying rent, and this again affects the company's income from that source. Thirdly, it is often remarked that employees who own their own homes are "too independent." Their homes are generally located at a little distance from the camp, which may make it inconvenient for them to do all their trading at the store. The policy of the company is to keep the company houses full in slack times, and as a consequence men renting company houses are retained on the payroll, while those owning their own homes are often laid off at such times. Such a policy when followed offers little inducement to men to be thrifty and saving enough to buy a house.

Company Store and Houses a Source of Profit

As shown by data collected by the Census Bureau, there are numerous coal operations where no money is made on the sale of the coal, but the business depends on the profits realized in the stores and the renting of the company houses, which profits are sufficient to pay interest on the whole investment. I know some mining towns in West Virginia, which are unfortunately few in number, where the rents charged are fair, considering the quality of the houses and all that goes with them. The houses are substantially built, roomy and plastered. They are located within fenced inclosures of large area, each house having its own vegetable garden and supplied with wholesome running water at all times of the year. The streets are graded, have fine sidewalks and are lighted by night. I know personally that the rents are just sufficient to pay a moderate interest on the investment, after providing for maintenance and amortization.

Such towns have solved, as nearly as it is possible to do, the problem of keeping a regular nucleus of steady men at work in the mines for a number of years. The managements are generally broad-minded and satisfied with smaller store profits, as proved by the trade they succeed in holding. More attention is given to the mines than to the store, and as a result the former are kept in the best condition. Such operators always realize a few cents' profit on every ton of coal taken from the mine.

In reference to the store question, I fear that if the policy of conducting that business at some mines is not changed radically, operators guilty of such practices as those described will be compelled by law to abandon the business. PICK.

Charleston, W. Va.

Letter No. 6—The invitation of *Coal Age*, Oct. 16, p. 619, if responded to with frankness by those who know, would make interesting reading, not only to coal men, but to the public in general, as the question of scrip has given rise to many misconceptions and not a few laws and investigations.

The issuing of store checks in some form or other is almost universal in connection with commissary business. As is usual, it has been the abuses of the system that have caught the attention of the public. Anyone reading the records of the Federal and state investigating committee and being himself familiar with the subject will be struck by the lack of information on the part of even men of affairs, as shown by the questions asked. One United States senator seemed to have the impression that coal companies never paid in money, and when he asked a miner how much he could buy with a dollar check and the miner grinned, he did not seem to see anything amusing.

Of course a mining man in one part of the country may not be able to speak with authority as to practices in remote districts, but exchanges of business confidences have served to give us a pretty fair idea of commissary customs over the country, sufficient to enable one to generalize somewhat.

VARIOUS KINDS OF STORE CHECKS

The crudest form of store check is a cardboard ticket or metal tag with simply the denomination and the name of the company stamped thereon and good for merchandise either at the company store or some other store designated by the company. Some companies issue books of tickets similar to ice or meal tickets, usually nonnegotiable. Where the company does not directly issue checks, the miners themselves sign requests for credit, which when properly countersigned by the timekeeper are honored by the clerks in the commissary.

From the company's point of view, it is hard to see anything but necessity in these various methods of facilitating business. We will not go into the necessity for company stores themselves. In some places they seem absolutely necessary, and some of the arguments for store checks seem more or less convincing. For example, a new miner arrives at a camp, "broke," not having a cent to buy his supper, or to feed his family. The company can do one of several things—send him on to the next camp, advance him cash, write an order to the commissary or give him a store check and charge him on account. If he is "turned down," he will readily find another camp willing to take a chance. If he is given cash, he is more apt to leave than stay. An order on the commissary will have to be audited in several different ways, and in the end it simply answers the same purpose as scrip, but lacks the convenience. He is given a store check for a dollar or two, so arranged that a punch will cut out the amount spent, by which the thriftless man is served. He may go to work or he may deal out his check and leave. If he works the check will be deducted from his pay. If he "beats it," the store has lost only the cost of the merchandise and not so much cold cash.

At a store in a mining camp there are certain times of the day and certain times of the month when there is a rush for supplies. It is not like a village store or a department store where the trade comes leisurely. The commissary clerk has many duties besides selling supplies, and when the whole camp turns out and wants to be served at once, you may see the convenience of the scrip. One snip of a punch serves the purpose of making change at the cash drawer or charging an account. Coal camps are often in out-of-the-way places, and large accumulations of cash would tempt robberies, while the check system does not necessitate keeping much cash in the store. There are much less bookkeeping and no long lists of purchases to wrangle over. There is a record of the issuing of the check, and that is the end of it so far as the company is concerned.

A MISTAKEN POLICY

But the question has been raised as to the thrift of those electing to draw store checks, and mention has been made of discounting the checks. This would indicate that there is still some public misconception or else some private abuse. The more thrifty miners will not spend more than they make, but the question of thrift does not enter into the manner of purchasing supplies, whether with cash or with tickets. A dollar ticket purchases just as much as a dollar cash at the company store. The only question of discounting store tickets comes up when the man without money does not wish to wait till payday, and he gets his more thrifty neighbor to cash his ticket at about 80c. on the dollar. No company of repute will itself discount store checks nor allow its officers to do so. It is not so much a matter of any moral wrong as of a mistaken policy. No good company permits it.

The appeal to abolish the store-check system seems to be based either on a misconception of the practical working of the system, or on the ground of making it more difficult for the miner to spend his money, thus forcing him to economize through sheer inconvenience.

As to forcing economy by making it more difficult to spend money, we all know there is something in this. We often hear coal men speak of being able to save a little money on a salary that in town would be gone before the next payday or carrying a nickel around for a week without a chance to spend it. But it may well be doubted whether the man who is forced into saving money in this way will ever prosper by thrift.

Laying up labor in the mine office may be likened to putting money in a bank, only it is never placed on deposit, but the miner and usually the whole family draw on it by store checks. The thrifty miner usually does the drawing himself and much of the dealing himself. After all, it is the old question of who is to be boss in the family. Men in general who have laid up wealth and a comfortable bank account would probably have nothing to show if wives and children were given checkbooks and allowed to draw on account at will. But this is precisely what happens in the mining camp. Often the miner has no idea whether he is going to draw any money or not on payday. There are men whom I as payroll clerk have not seen around the store or office for months at a time. Their families draw all their wages as fast as the time is turned in.

THE "WOMEN'S PAYDAY"

Those familiar with mine-office work understand what is meant by the "women's payday." It is the day immediately after the closing of the time sheets of the month or half-month when all checks drawn will not be charged against the payday balance, but against the time for the next pay. I have seen women come in on those occasions and draw as much as $30 or $40 in scrip, sometimes buying supplies for the month, but often indulging in purchases which they could not afford. When a crowd of these women are waiting to be served with "first-of-the-month" store checks, it is interesting to note all the little byplays indicating the social aspirations of the village matrons. Some will hold back to see how much the others are going to draw. Mrs. A., whose husband is a contractor, will carelessly call for half of her husband's credit, and then Mrs. B., whose man is also one of the high-wage earners, will go a few dollars better, and the rest of the women all enjoy the effect as much as butterflies of the ballroom enjoy their social triumphs.

Yes, there is little question but that store checks stimulate trade at the company stores. A buyer, after getting the supplies he came for and having five or ten cents left unpunched, will wander around and try to think of something to spend it for, usually hitting on candy. In other words, the tendency is to save the silver dime, while the ten cents on the check will be spent, but it would not seem fair to blame the system for such thriftlessness. No, it is doubtful whether store checks can be indicted for the thriftlessness around mining camps. It is perfectly true that if you refuse to sell or make trading inconvenient there will be more money drawn on payday, but some women keep their husbands sober by drawing up all their credit so they will not draw money on payday.

THE MINE OFFICE A BANK

I have likened the mine office to a bank where labor is deposited. There is this difference: Where the miner is prodigal with his paper money, the company also is apt to fall into the same attitude, and when a miner's account is overdrawn there is not the same care in stopping the checks as in a bank where money is given out. We would hardly hand out a dollar in cash to a miner who had no time in, but he must have a bad reputation indeed if we refuse him a dollar scrip to get tobacco or provisions.

One large company, operating in several states, some years ago charged off over $50,000 in bad accounts made largely by issuing store checks beyond the credit of the miners. That $50,000 was just the same in purchasing value to the men as $50,000 in gold, and all companies charge into profit and loss every year overdrafts that are no longer good.

The proposition of doing away with the store-check system in order to encourage thrift in the coal camp is one thing, and the substitution of a better system is another. It is well to note that, on account of the foreigners and the illiterate natives, every system of accounting about the mines must be of the simplest kind. Check numbers are given these men; pegs are stuck into a hole to keep the tally of the cars; a metal check is hung on each loaded car by the miner; every kind of count is kept in a way that is easily and quickly understood. While their memories are usually good, they cannot be relied on for proofs in case of disputes in bookkeeping, nor can the average miner be expected to understand a very complicated system of debits and credits. In the check system, the miner wants a credit of a dollar. He gets a check with a hundred numbers on it, and he receipts for it. He carries it and personally superintends the punching out of each number until the dollar is gone, and there is no chance for dispute. The plea is made for him to save his money and get everything on a cash basis. How much business does the world do on a cash basis? The thrift that has made wealth comes more from the judicious handling of debits and credits than from cash transactions.

DOING AWAY WITH THE STORES

Those who think they discover a certain iniquity in the union of a coal operation and a commissary and who have advocated a divorce would speedily solve the check system by doing away with the stores. Very few coal men would contend for a minute for the commissary were it possible to operate without it. Either the isolation of the plant demands it or the profit is needed to make operating possible. There is a profit in the company store coming from the large amount of business done with a small force of men who would have to be around the office anyway.

Thrift cannot be forced on a community by any artificial means. It must start with the individual, and it only becomes a community virtue when the moving spirits of the community are thrifty. Miners are "good spenders" and are proud of that distinction. We often hear it said that any industrious miner could save up money and make himself independent. This is probably true of an industrious, thrifty workman of any trade, but it is more especially true of the miner.

However, we sometimes forget that there is a social life to be maintained in every stratum of society. The habit of spending freely is almost considered the virtue in a mining community, and not many miners care to save money at the expense of their popularity. They will fight for a few cents on their accounts, but waste twice as much to show their contempt of being called saving.

The other evening at a meeting where some demonstrations were being made with mine gases the lecturer called for some small boy who wanted to make a nickel to get a pitcher of water. Although there were a dozen miners' sons in the house, the manager of the company was a little embarrassed to see his own boy eagerly come forward, and he wanted the nickel too. Did you ever have any experience with small boys in a mining camp? This question of thrift and store checks will bear some very careful study before generalizing too much as to its cause and effects. JOSIAH KEELY.

Kayford, W. Va.

Efficient Mine Foremen

Letter No. 12—The discussion of what constitutes an efficient mine foreman has interested me greatly, and I am inclined to add a few suggestions along this line.

It must be admitted, in the start, that the mine foreman holds a very responsible position. Indeed, his responsibility is far greater than what one man should bear. He is held responsible for the safety of every man working in the mine, so far as the conditions existing therein are concerned. He must see that the mining law is obeyed in every respect—that the mine is well ventilated, so that the air current is conducted properly throughout the mine and made to sweep the face of every working place. He must see that the haulage roads, travelingways and air passages are kept in a safe and healthful condition. He must personally inspect the working places in the mine to see that they are well-timbered and safe for work. He must give the necessary instructions for the placing, charging and firing of holes in blasting the coal and roof. He must examine all reports of the firebosses and assistant foremen, and know that the working places are free from gas and that all falls and abandoned places have been properly examined.

Foreman's Relation to Other Mine Officials

In addition to these responsibilities, the company holds the mine foreman accountable for the daily output of coal. The miners expect him to settle their numerous and often petty troubles and disputes, arising from the unequal distribution of cars or any delay in the cutting of their coal by machine and other causes real or imaginary. The superintendent holds the foreman responsible for seeing that his orders are carried out with respect to the development and operation of the mine. The manager holds him responsible for the daily and monthly cost sheets and the upkeep of the equipment—the condition of the mules, motors and other machinery and mine supplies. The mine inspector holds the mine foreman responsible for compliance with the mining law and the safe and sanitary condition of the mine.

In view of these almost endless responsibilities, it is plain that the efficient mine foreman must be an experienced miner, driver, motorman, trackman, timberman, bratticeman, electrician, machinist and, finally, an expert in first-aid work. In other words, he must be experienced in every branch and department of coal-mining work.

Important Points Neglected

It is to be regretted that nearly all mine foremen who have passed the examination and been granted a certificate of competency think there is no further need of studying, when in truth that is just the time they should begin to study harder than ever. It is my belief that all mine foremen should be examined every four or five years, which would require continuous study and improvement on their part and make them more efficient, alive and uptodate.

Another point that is sadly overlooked or neglected occurs in connection with the granting of certificates of competency to applicants who have failed to furnish the examining board with sufficient evidence of their sober character and temperate habits. In many instances the members of the examining board are less to blame for this condition than the mine officials and politicians who frequently recommend men for these positions without a sufficient knowledge of their character and habits. Most mining laws require that applicants for these positions of responsibility shall be men of "good moral character and known temperate habits."

In my opinion examining boards should give this matter closer attention and require of applicants more specific information than is conveyed through a recommendation from a friendly mine official, politician or acquaintance. All applicants should be required to furnish an affidavit, sworn to before a justice of the peace or some other county official, specifying his character and habits. When it is remembered that the lives of hundreds of men are daily placed in charge of the mine foreman, assistant mine foreman and fireboss, it will be realized that this is a grave question relating to the character of these officials and one that should receive the most careful attention before a certificate is granted to an applicant.

Results of Certifying Incompetent Foremen

It may be argued that a mine official of this type—one who is somewhat the worse for drink and, as a consequence, neglects his duties in the mine—cannot long hold his position. The time is long enough, however, for him to put the mine in a dilapidated condition and to be the direct or indirect cause of the loss of many lives and other accidents. A mine foreman who does not properly attend to his duties soon runs up the cost of production, and the condition of the mine becomes such that it will require months of hard work on the part of a more efficient man to again put the work on a paying basis.

It is strange that many operators and superintendents fail to realize that there is a great difference in the value of different mine foremen to the companies who employ them—that some foremen are worth two or three times what other foremen are worth. It is unquestionably a great mistake to regard all foremen as capable of drawing the same pay when the difference between them is as great as that between day and night. These men should be paid on a basis of their efficiency, and there would then be a greater incentive for mine foremen to strive for their own improvement. There is always a certain satisfaction in the efficient foreman receiving the commendation of the mine inspector and knowing that the mine in his charge is in a safe and healthful condition. This satisfaction, however, does not compensate wholly for the hard work such a foreman performs in order to develop and maintain this condition in the mine.

In closing, permit me to say that I have known mine foremen and firebosses who, within two months after receiving their certificates, have neglected their duties and returned to their habits of drinking to such an extent that their certificates were taken from them. This, however, was not done until the lives of many miners had been endangered by the neglect of the men whose duty it was to care for their safety. Had the examining boards been more particular and made it their duty to investigate the character of applicants, such instances could not occur with as much frequency as they have in the past.

OLIVER YOUNG,
Nu Mine, Penn. Assistant Mine Foreman.

⁂

The Study Course in Coal Mining was necessarily omitted this week, but will appear as usual in our next issue.

Inquiries of General Interest

Haulage on Inclines

I was interested in reading the two articles relating to haulage on inclined planes, *Coal Age,* Nov. 13, p. 816, and there are two questions that I would like to ask. The first is, Is not the allowance made for track resistance—namely, 40 lb. per ton, or 2 per cent. of the load hauled—very low?

The second question is, Why do you multiply this track resistance by the cosine of the angle of inclination of the plane? That makes the track resistance, which is due to the entire friction of the moving load, less as the inclination of the plane is greater. For example, it shows that the track resistance is less on a 30-per cent. grade than it is on a 25-per cent. grade. I have always supposed that the friction of a moving load was independent of the grade of the track; or, in other words, that the frictional resistance of a trip of cars moving up or down the grade was the same as when moving on a level track.

California, Penn. MINE FOREMAN.

Replying to the first question, in regard to track resistance: Track resistance is given by different authorities as ranging from 20 to 50 lb. per ton of moving load. The actual amount of resistance, in any given case, depends on numerous conditions relating to the condition of the rolling stock and of the track, the size of wheels used and style of bearings, degree of lubrication, etc.

In order to make a safe estimate of drawbar pull, under the adverse conditions incident to coal mining, a track resistance of 50 lb. per ton is often employed, although this is acknowledged to be much greater than what should be allowed under fairly good working conditions. It is customary for manufacturers of mine locomotives to use a value of from 20 to 30 lb. per ton in estimating track resistance. It is partly due to the strong competition in this branch of the coal industry that a lower track resistance is assumed by manufacturers than is often advisable to allow in actual practice.

Nothing is more annoying in the operation of a mine than the stalling of a loaded trip, because of the actual track resistance being somewhat greater than that allowed by the manufacturers of the locomotive in use. This condition, of course, can be remedied by the proper upkeep of the mine roads and maintaining the rolling stock in the best condition, but often this is neglected in mining practice. When hauling a long trip of mine cars loaded to their capacity, the size, kind and condition of the car-wheels are important factors in determining the amount of track resistance per ton.

For the reasons mentioned, when the conditions in the mine are not described or known we prefer to use a track resistance of 40 lb. per ton for haulage on level tracks, assuming fair average conditions in the mine and allowing a margin that will provide against possible exigencies.

Replying to the second question: When hauling on an appreciable grade, say a grade exceeding 10 per cent., the normal pressure of the load on the track is considerably less than the weight of the load. This normal pressure varies as the cosine of the angle of inclination. It is the normal pressure of the load on the track that determines the amount of track resistance, the latter being a percentage of such normal pressure.

On a level track the normal pressure is equal to the weight of the load, the inclination of the track being zero and the cosine of its angle 1. As the inclination of the plane or the grade of the road increases, the normal pressure of the load on the track decreases with the cosine of the angle and becomes zero when the angle of inclination is 90 deg., as in a vertical hoist where the normal pressure of the load on the guide-rails becomes *nil* and the track resistance reduces to zero. This is the condition when hoisting in a vertical shaft. For the reasons given, it is necessary when estimating haulage on an incline greater than, say 10 per cent., to multiply the track resistance for a level track by the cosine of the angle of inclination of the plane.

⁂

Blower vs. Exhaust Fans

What is the reason that a blower fan operates under a comparatively higher water gage than an exhaust fan working under the same conditions in respect to the mine and driven at the same speed? THOS. MCMANUS.

Manifold, Penn.

Assuming the same type and size of fan in each case, the difference between these two systems of ventilation is that when the fan is blowing, the air within the fan commonly has a greater density than when exhausting. During the major portion of the year the mine air is generally warmer and therefore lighter than the outside air, and when much gas is generated its presence has a tendency to further decrease the density of the air.

Owing to the greater density of the air within the fan when operating as a blower, a somewhat greater power is required to produce the same speed. Also, the efficiency of the fan is increased to a slight extent. For these reasons, a fan operated as a blower will generally yield a somewhat higher water gage than when exhausting at the same speed and under the same conditions in respect to the mine.

This difference, however, is almost inappreciable, and when a higher water gage is observed in these two systems of operation, it is generally due to other hidden causes that are frequently unobserved. For example, there frequently exist in the mine natural motive columns that may either assist or oppose the circulation induced by the action of the fan. These hidden and unobserved natural columns are often potent factors in increasing or decreasing the water gage observed in the fan drift. It is important in making fan tests to eliminate the influence of such natural air columns existing in the mine, in order to obtain a truly comparative test of the fan.

Examination Questions

Miscellaneous Questions

(Answered by Request)

Ques.—With a water gage of 0.6 in., the quantity of air passing in an airway is 24,000 cu.ft. per min.; what water gage will be required to pass 36,000 cu.ft. per min. in the same airway?

Ans.—For the same conditions in the mine or airway, the unit pressure or water gage varies as the square of the quantity of air in circulation. In other words, the water-gage ratio is equal to the square of the quantity ratio, which gives in this case

$$\frac{w.g.}{0.6} = \left(\frac{36,000}{24,000}\right)^2 = \left(\frac{3}{2}\right)^2 = \frac{9}{4}$$

$$w.g. = \frac{0.6 \times 9}{4} = 1.35\ in.$$

Ques.—The diameters of two circular airways are 3 ft. and 4 ft. respectively. If a pressure of 5 lb. per sq.ft. will produce a given circulation in the 4-ft. airway, what pressure will be required to produce the same circulation in the 3-ft. airway?

Ans.—For circular airways of the same length, the unit pressure producing circulation varies inversely as the fifth power of the diameter of the airways. In other words, the pressure ratio is equal to the fifth power of the inverse diameter ratio, which gives in this case

$$\frac{p}{5} = \left(\frac{4}{3}\right)^5 = \frac{1,024}{243}$$

$$p = \frac{5 \times 1,024}{243} = 21.07\ lb.\ per\ sq.ft.$$

Ques.—In an airway 6x8 ft. in section and 1 mi. long, a water gage of 1.2 in. produces a velocity of 500 ft. per min. If the length of this airway is increased to 2 mi., what water gage will be required to increase the velocity of the air current to 750 ft. per min.?

Ans.—For the same cross-section of the airway, the unit pressure or water gage producing circulation varies directly as the length of the airway and the square of the velocity of the air current, which gives in this case

$$\frac{w.g.}{1.2} = \frac{2}{1} \times \frac{750}{500} = \frac{2}{1} \times \frac{3}{2} = 3$$

$$w.g. = 1.2 \times 3 = 3.6\ in.$$

Ques.—In a mine giving off 2,500 cu.ft. of marsh gas per minute, the volume of air entering the mine at the intake opening is 4,500,000 cu.ft. per hr.; what is the percentage of gas in the return airway?

Ans.—The volume of air entering the mine is 4,500,000 ÷ 60 = 75,000 cu.ft. per min. Adding to this the volume of gas generated per minute gives for the total volume of air and gas in the return airway 75,000 + 2,500 = 77,500 cu.ft. per min. The percentage of gas in this return current is then

$$percentage\ of\ gas = \frac{2,500 \times 100}{77,500} = 3.23\ per\ cent.,\ nearly$$

Ques.—A ventilating fan 16 ft. in diameter and 8 ft. wide, running at a speed of 100 r.p.m., is producing 125,000 cu.ft. of air per minute against a water gage of 2 in. (a) At what speed must this fan be run to produce a volume of 150,000 cu.ft. per min. in the same mine? (b) What will be the water gage at this increased speed?

Ans.—(a) For the same conditions in the mine or airway, the speed of the fan varies as the fourth root of the fifth power of the quantity of air in circulation. In other words, the speed ratio is equal to the fourth root of the fifth power of the quantity ratio, which gives here

$$\frac{n}{100} = \sqrt{\left(\frac{150,000}{125,000}\right)^5} = \sqrt[4]{\left(\frac{6}{5}\right)^5} = \sqrt[4]{1.2^5} = 1.256$$

$$n = 100 \times 1.256 = 125.6\ r.p.m.$$

(b) For the same mine or airway, the water gage varies as the square of the quantity of air in circulation. In other words, the water-gage ratio is equal to the square of the quantity ratio, which gives here

$$\frac{w.g.}{2} = \left(\frac{150,000}{125,000}\right)^2 = \left(\frac{6}{5}\right)^2 = \frac{36}{25} = 1.44$$

$$w.g. = 2 \times 1.44 = 2.88\ in.$$

Ques.—If a water gage of 1 in. is required to circulate 50,000 cu.ft. of air per minute, in a certain mine, what will be the volume of air in circulation when the water gage is increased to 1.6 in., by increasing the power?

Ans.—Since the increase in water gage in this case is due to an increase in power and is not therefore owing to any change in the mine or airway, the quantity of air in circulation in this case varies as the square root of the pressure or water gage. In other words, the quantity ratio is here equal to the square root of the water-gage ratio, which gives

$$\frac{Q}{50,000} = \sqrt{\frac{1.6}{1}} = \sqrt{1.6} = 1.265$$

$$Q = 50,000 \times 1.265 = 63,250\ cu.ft.\ per\ min.$$

Ques.—If a mixture of air and gas, at its most explosive point, is passing through an entry 6x8 ft. in section, at a velocity of 400 ft. per min., what quantity of air will be required to dilute this mixture until it contains only 1 per cent. of gas?

Ans.—The total volume of air and gas passing in this entry is 400 (6x8) = 19,200 cu.ft. per min. A mixture of marsh gas and air (CH_4), at its most explosive point, contains 9.46 per cent. of marsh gas when no other gases are present. On this assumption, the quantity of gas present in the current circulating in this entry is 0.0946 × 19,200 = 1,816.32 cu.ft. per min. Now, if this gas is to form 1 per cent. of the return current, it will be necessary to add sufficient air to make the total volume of air and gas on the return 1,816.32 ÷ 0.01 = 181,632 cu.ft. per min. In that case, the volume of air to be added is 181,632 — 19,200 = 162,432 cu.ft. per min. The total volume of air in the return current, under these conditions, is practically 181,632 — 1,816 = 179,816 cu.ft. per min.

Coal and Coke News

Harrisburg, Penn.

The State Insurance Board will have many perplexing problems to face, and has a difficult task ahead to carry out its proposed plan to handle liability insurance at 10 per cent. less than the amount agreed upon by commercial underwriters, according to opinions expressed by leading insurance men, manufacturers and coal operators who attended the Efficiency and Welfare Convention at the Capitol during the week.

It was predicted that in view of the fact that the state board must take the hazardous business which the insurance companies refuse to accept, its business would be lopsided. Some assert that the state fund would not be popular with the manufacturers and the large coal companies of the state, because they believed it would place too much power in the hands of the politicians.

It was the general opinion among those who attended the conference that the State Insurance Board would be entitled to the 10 per cent. discount, because of the extra hazardous risks it would be forced to assume. One of the risks that must be taken by the board will be that of coal mines. At the present time there are 10 leading insurance companies in a pool to underwrite unlimited compensation for coal mines. It is said that not one of the companies would attempt to assume such a risk alone.

It is pointed out that as a result of the unfortunate experience of the State Insurance Board in West Virginia, where an explosion in a coal mine is said to have sent the board into bankruptcy, the members of the board would see that the rates in Pennsylvania would be ample and probably excessive.

The state fund can only protect the employer for his obligation to pay compensation required by law. If any action is brought under the common law to recover for impairments or disfigurement or any case where the employer may be denied compensation, the state fund does not protect.

Stock Companies May Assume Entire Risk

The stock companies by their contract will assume the employer's entire obligation to pay compensation and also settle any claims, defend any suits and pay all expenses incident thereto without limit. Therefore the state contract fails to give protection of a necessary kind, and it is claimed, should be sold at a less rate than the stock companies, as above described. Another point argued is, that an injustice of the state fund is that all citizens, whether they are interested in the fund or not, will be taxed to pay the expenses of the administration with its few members.

The workmen's compensation board has announced that all information given by persons, companies or others applying for exemptions from insuring shall be considered confidential as are corporation reports on earnings to the auditor general. It was also decided that such information cannot be used for purpose of taxation.

During the discussion of the act while pending in the Legislature the opposition, argued that married men and aged men would be discriminated against in employment, the former because the liability for workmen with families is greater than for those without families, and the latter because the aged were more liable to injury than younger workmen.

The fear of discrimination is largely without reason. In the first place, an employer need not pay a higher rate of insurance for the married employees than for the unmarried one, nor a higher rate than for the younger one. The fact that rates are uniform will give no cause for discrimination. If the damages came directly out of the pockets of the employers, the case might be different, at least in respect to the aged employees.

Messrs. Scott and Leach of the Workmen's Compensation Board say that married men are as a rule more careful than those who are not married. They have a better realization of their responsibility as wage earners for families.

The only drawback the law can have upon the employment of old people is the fact that insurance rates will be based upon the average payment in the way of liability. The fewer the accidents the less the cost of insurance. It is possible that employers will deem it to their interest to reduce the liability, in case there are too many accidents among aged employees, in order to secure more favorable terms. But the tendency even now is to place employees made infirm by reason of age in positions where accident liability is at a minimum.

Appeal Is Taken to Supreme Court

Upon the application of G. Carrol Todd, assistant to the United States Attorney-General, Judges Buffington, McPherson and Hunt, in the United States District Court, on Nov. 19, allowed an appeal to the United States Supreme Court in the suit of the Government against the so-called anthracite coal trust, which was virtually dismissed by the Federal Court in a decree filed last month. While the court ordered the Central R.R. of New Jersey to divorce its interests in the Lehigh & Wilkes-Barre Coal Co., holding that this action would attain the ends sought by the Government, the prosecutor is not satisfied and will seek to have all of the defendants, which includes the Reading Co., the Philadelphia & Reading Coal and Iron Co., and other hard-coal-carrying railroads, adjudged violators of the Sherman anti-trust act.

Fourteen errors are assigned in the petition for the appeal. It is contended that the Court erred in refusing to sustain the entire complaint of the Government and also to adjudge the Reading Co., the holding corporation, a combination in itself in restraint of trade. The Government's attorney pointed out that the court erred in refusing to dissolve the union of the Philadelphia & Reading Coal and Iron Co. and the Lehigh & Wilkes-Barre Coal Co., which was found to be an illegal union, by requiring the Reading company to dispose of its controlling interest in the capital stock of the Central R.R. of New Jersey. In other words, the Government seeks to have the Court dissolve the more powerful corporation instead of the minor subsidiaries.

PENNSYLVANIA

Anthracite

Nesquehoning—Five hundred employees went out on strike at the Lehigh Coal and Navigation Co.'s No. 6 shaft on Nov. 18, because a number of workmen had been suspended. The employees of No. 14 and Spring Tunnel operations are still on strike, 1,900 being affected. Until the 18th, in its retrenchment policy the company laid off only men employed on nonproductive work, but orders were given that some miners and laborers be laid off. The company officials say these orders are not permanent, but that different men will be laid off at different times as the occasion arises. Thus far about 475 men have been suspended.

Scranton—The People's Coal Co. has offered to contribute $1,000 a month during the continuation of its mining operations to a fund to be devoted to the repair of properties damaged by mine caves in its workings. The only condition imposed by the company is that one of its representatives be allowed to sit on the board which will have charge of the distribution of the money. This practically means it is thought the solution of the mine cave problem in Scranton as the company has already promised to take every practical precaution in the mining of coal, the back filling of workings as the coal is taken out, and the supporting of the surface vein with numerous props. It is explained by the company that it would rather coöperate with the people of West Scranton in the solving of the cave problem than to expend the money in legal battles. The expenditure of the fund would be done by a board named by the protective association which would have a representative of the coal company as a minority member.

Wilkes-Barre—The Lehigh Valley Coal Co. recently leased the Lattimer coal stripping lying at the west of its Drifton tract, and will shortly start work on the new property. This company is also arranging for new strippings at Buck Mountain, and will also start excavation at Oneida.

Coaldale—The nine men who were entombed for six days in the Foster tunnel of the Lehigh Coal and Navigation Co., have been paid regular hourly wage rates for the entire time they were shut in by the fall of coal. After being rescued they were placed on half pay until able to resume work.

Shamokin—The Philadelphia & Reading Coal and Iron Co. was recently awarded the contract for building public roads in New Castle, Norwegian, Branch, Reilly, Cass, Foster, Butler, Mahanoy, and Frailey townships. This firm pays more taxes in these districts than all the other taxpayers combined, and has found it cheaper to build roads at its own expense than to pay for this work in taxes.

Fire believed to have been of incendiary origin recently destroyed the blacksmith and carpenter shop at the Hickory Ridge colliery, resulting in the complete destruction of the building, together with all its contents, entailing a loss of more than $1,000.

Bituminous

Connellsville—Coke operators throughout the Connellsville region are working their plants six days per week and firing additional ovens whenever labor therefor can be obtained. Production recently amounted to 427,000 tons, with shipments to 430,000 tons. Merchant plants are, generally speaking, cleaned of stock. There are not enough men in the region to operate the ovens already fired, and many of the men now at work insist on extra holidays every week, so that the labor situation is becoming acute.

Salina—A runaway mine car resulted in the destruction of the tipple of the Apollo Coal Co. recently. The car broke loose at the top of the incline, ran down the grade, and through the tipple, upsetting a small heating stove. Fire followed, and the tipple was destroyed.

New Castle—Alleging that a horse and a cow were killed, and several other domestic animals made dangerously sick by drinking poisonous mine water drained on his property from the works of the Consolidated Stone and Mining Co., James S. Moore, a farmer of Wayne township, recently brought suit in the prothonotary's office to recover damages to the amount of $5,000.

Reynoldsville—R. A. Cartwright, E. B. Newton, and others interested in the Panther Run Coal Co.'s mine, are opening a new mine nearer town, which will employ about 400 men, and will be operated entirely by electrical machinery.

Homer City—The Homer City Coal Co. has purchased a tract of land from the Tearing Run Coal Co., and has turned it over to the miners to be farmed. Later houses will be built on the tract, which comprises about 30 acres.

Cresson—The coke ovens of the Pennsylvania Coal and Coke Corporation are to be fired in the near future, it is stated. The increase in the demand for coke will boom things in the mountain town this winter, in the opinion of coal operators and others. The mines of the Pennsylvania Coal and Coke Co. are working again, after having been idle for several months.

Gallitzin—A little oil lamp exploded in one of the six dwelling houses owned by the Baker-Whitley Coal Co. on Nov. 17. A few minutes later the entire row was afire. The houses were burned to the ground, and while no one was injured a number of inmates narrowly escaped cremation. The loss is about $10,000.

Pittsburgh—Negotiations said to be in progress for several thousand acres of coal lands in Greene County may aid J. V. Thompson's effort to raise money to pay his creditors. He owns considerable land in that section. The Bethlehem and Midvale steel companies are seeking to buy virgin coal properties to make themselves independent of the United States Steel Corporation. Both the Bethlehem and Midvale steel companies are big consumers of Connellsville coke. A subsidiary of the United States Steel Corporation, the Frick company, has dominated the situation and dictated prices to all big steel plants. With the expansion of the Bethlehem and Midvale companies, both realized the necessity of obtaining an independent supply of coke. The Fayette County coking coal lands being held by Steel Corporation interests both companies turned to the virgin tracts in Greene County. Options have already been secured it is said on nearly 3,000 acres from Mt. Morris to the Fayette County line.

WEST VIRGINIA

Charleston—The free employment bureau of the state department of labor recently received a request for 75 miners for work along New River. Mining companies of that district declare that they need many men at once.

Forty fatal accidents in and about the mines of the state occurred during October, according to the report issued by Earle A. Henry, Chief of the Department of Mines. Fourteen fatalities occurred in Fayette county, nine in McDowell, four each in Logan and Marion, three in Kanawha, and one each in Brooke, Clay, Harrison, Mercer, Putnam and Raleigh. Chief Henry takes the occasion of calling attention to the fact that the majority of fatalities in the coal mines of the state, aside from those caused by explosions, are due to falls of roof and coal. He has therefore instructed all mine foremen and their assistants to spend more time inside the mines than they have heretofore done. He says that many accidents would not occur if these foremen were less indifferent to discipline and the examination of dangers that continually surround the miners.

Bluefield—The report of the coal handled by the Norfolk & Western R.R. during October would indicate that the coal traffic for 1915 will exceed that of last year at least 5,000,000, and possibly more. Such an advance in the road's tonnage in one year would more than double any previous yearly increase, the average since 1909 being about 2,000,000 tons annually. Heretofore the Norfolk & Western has been the fourth largest coal carrying road in the United States, being exceeded by the Pennsylvania, the Baltimore & Ohio, and the New York Central lines. It would appear now that the Norfolk & Western is destined to take place at the close of this year as the country's second largest coal carrier.

ALABAMA

New Castle—The 387 ovens of Ramsay & McCormack will be fired immediately to take care of a contract of 150 tons of coke per day for 12 months time for shipment to the Sloss-Sheffield Steel and Iron Co. for use at the North Birmingham furnace. This is the first time these ovens have been in use for several years.

Birmingham—The payrolls for this district being paid this month are larger than for the past seven years. Practically every industry is working full time, and the prospects for steady work are good.

TENNESSEE

Knoxville—Detailed investigation covering every phase of possible exporting of coal from the Tennessee-Kentucky section to South American markets by way of Charleston, S. C., will be made by representatives of the Southern Appalachian Coal Operators' Association as a result of the recent meeting here. Col. James R. Wooldridge, president of the association, discussed the various angles on this business in his address to the members present and special committees were appointed to look into the various phases of the possible business. A number of operators present at the meeting reported car shortages, which, according to Secretary J. E. McCoy, vary from 10 to 40 per cent. The commercial market is in good condition, it was reported, and the domestic market is improving.

KENTUCKY

Whitesburg—First shipments of coal from the plant of the Southeast Coal Co. at Seco have just gone out.

Clay—Fire recently caused $2,500 damage in the engine room of the Fairmount coal mines and put the plant out of commission for several days.

OHIO

Bellaire—The Rail and River mine No. 6 recently resumed work for the first time in almost 20 months. Only a few men went to work at the opening, but it is expected that more will be put to work shortly. When working full, the mine employs about 250 men. The output of the mines throughout this county has been, during the past week, the best since the resumption. The Grand Trunk mines are making the best time, the coal being used by the road, and subsidiary lines for fuel. The Webb mine on Wegee Creek has been cleaning up and timbering for some time.

Leetonia—The coke plant at the Cherry Valley Works of the United Iron and Steel Co. has started full operation after a shut down since the first of the year, the entire capacity of the plant of 198 ovens is being worked by about 75 additional men.

INDIANA

Indianapolis—The proposed increase in rates of 15c. a ton on coal agreed on by officials of Eastern railroads will have little effect in Indiana, it is said. It is mainly for the benefit of Ohio operators who have trouble competing with the coal from neighboring states that comes into Ohio. If it affects Indiana it will be only along the eastern border, which is already served mostly by outside operators. The proposed increase of 5c. in freight on Indiana coal shipped to points within the state is opposed by Indiana operators, however, because it gives an additional advantage to the shippers of coal into Indiana from other states.

Brazil—Coal from strip mining, in the eighth district, United Mine Workers of America, is said now to exceed in quantity that mined underground. The Globe Coal Co., of Indianapolis, which has about 800 acres lying west of this city, has just begun putting this coal on the market. The first day it produced five cars. The company has two locomotive and one steam shovel and is putting in another shovel which is said to be the largest in the Middle West. There are three veins of coal on the land. The first is 7 to 8 ft. in thickness and 18 to 25 ft. under the surface. Beneath this there are two thick veins of block coal which will be mined later in the usual way. There are now six producing pits in this vicinity; one south and one west of the city; two at Carbon and two at Patricksburg. These pits are all manned not by miners but by common laborers. Block coal miners say the pits are difficult to compete with.

ILLINOIS

Duquoin—Seven miners were injured and nearly 500 others were imperiled by a recent gas explosion in the mine of the United Mining Co., at Buckner, 15 miles east of here. The explosion was confined to one entry and thus the property damage was light

The Perry County Circuit Court has appointed three trustees to handle the estate of the late Henry Horn, Sr., large mine owner and banker, and dispose of it for the benefit of creditors in the Henry Horn bank, which closed its doors in December, 1914, following the death of Horn. The trustees are: Lucius S. Smith, president of the First Bank and Trust Co.; Henry C. Miller, president of the First National Bank, and Charles J. Eschmann, a stockholder in the Duquoin State Bank. The deposits of the bank were between $350,000 and $400,000. There was very little cash on hand when the bank closed, but it is expected that the depositors will receive between 25 and 50 per cent. from the sale of the Horn mining properties, business property and farms.

Centralia—Operators in this section have been preventing a glut of nut, pea and slack coal on the St. Louis market by unloading these grades on the ground when the demand was weak, releasing the cars and holding the fine grades until the demand improved. This policy, pursued this winter for the first time, has had the effect of keeping prices on the fine grades firm at St. Louis. The only expense incurred is the labor cost of unloading and reloading the cars. The coal has to be loaded on the cars from the tipple because none of the mines are equipped to dump directly to storage. There is little loss from deterioration as the fine grades are not affected to any extent by weather conditions.

Belleville—At 11 a.m. Nov 20 at the courthouse in Belleville, the mining property of the Tirre Coal and Mining Co., located at Tilden, Ill., was sold at public auction for the sum of $3,500. A Mr. Willhite was the successful bidder. At this writing it has not been learned what plans if any have been made for the future of the property.

Coulterville—On a change of venue from Perry County, suit has been filed at Belleville, Ill., by the bondholders against the owners of the St. Louis Coulterville Coal Co.'s mine at Coulterville, known as the Hippard mine. The suit which is for the purpose of foreclosure, has been placed on the docket for January hearing

Virden—What is possibly the last chapter to an historic old Illinois mine was enacted recently when officials of the United Mine Workers of America canceled the charter of Local No. 693 at the Old North mine at Virden, Ill. The top works were destroyed by fire last spring and the place has been idle ever since. For two years this mine held the record output for the state. As a result of trying to import negro strike breakers at this mine a serious riot occurred on Oct. 21, 1898, in which 26 lives were lost. Since that time and in commemoration of that day the miners over a greater part of the state have refrained from work on what has been called Virden Riot Day.

IOWA

Des Moines—Ten first-aid teams are to be organized in Des Moines in connection with the Iowa Industrial hospital. Demonstrations will be held by J. J. Forbes, Federal representative of the bureau of mines, who has arrived with the United States first-aid car to launch a two-weeks' campaign among the miners. Classes will attend from the mines and industrial plants in and about Des Moines. One of the demonstrations will be made by a trained team of Colfax miners. The men will be taught to handle injuries which are common in mines.

MISSOURI

Kirksville—The Big Creek Coal Co. is now paying its employees in gold and silver. On the last payday the company paid out $5,000, nearly all of which was in gold. The reason is that it is more convenient to handle coin than currency. During the winter months the amount distributed each payday is about $12,000, but it will all be paid in specie.

OKLAHOMA

Sans Bois—The Sans Bois Coal Mining Co. has reopened the mine here, which had been closed down for about a year. The increasing demand for export coal is assigned as the cause for reopening the mine.

Oklahoma City—A decrease of 410,757 tons in the annual production of coal in Oklahoma is shown in the annual report of Edward Boyle, state mine inspector, just made public. This report gives the production for the year ending June 30, 1915, at 3,321,795 tons, as compared with 3,732,552 tons last year. Machine-mined coal amounted to 23.2 per cent. of the total, an increase of 2.5 per cent. over last year. The industry gave employment to 7,669 men in Oklahoma and the net yearly earnings of miners using picks was $704.95 per capita, while the net yearly earnings of those using machines was $615.40. Work during the year was more intermittent than usual, owing to labor difficulties and the competition of fuel oil. One former coal-producing county, Haskell, has ceased to produce coal during the year, but it is stated that the San Bois mine in that county has resumed operation. New mining operations are noted in several localities and prospects are bright for an increased output of coal.

FOREIGN NEWS

Rome, Italy—There has been a report that arrangements are being made to import Japanese coal into Italy. This seems improbable, as there is plenty of English and American coal to be had if it can be transported, and the distance is considerably less than from Japan.

PERSONALS

Donald D. Conn, of Detroit, has been appointed combustion engineer of the Wyatt Coal Co., with headquarters at Cincinnati.

G. A. Bonham, for several years with the Norfolk & Western R.R. in Bluefield, W. Va., has sent in his resignation, and will shortly leave for Portsmouth, Ohio, where he has accepted a position with the Pocahontas Coal Co.

Harry Jones, a brother of John H. Jones, president of the Four States Coal Co., is negotiating for the purchase of the mining properties of the Peck Coal Co., operating at a point between Winifrede Junction and Marmet, on the main line of the Chesapeake & Ohio R.R. The capacity of this mine is about five railroad cars per day, the coal being a West Virginia splint.

James Craig recently became lost in the mine of the Creighton Coal Co., at Creighton, Penn., and wandered about for three hours before a searching party found him two miles from the mouth of the mine. Craig, a mine foreman, was making an inspection of the unused workings, when he fell into a pool of water, which extinguished his acetylene lamp and dampened his can of carbide which began generating gas, so that he was forced to throw it away on account of the danger of an explosion. In the darkness he could not find his way, but was finally located by the searching party.

James E. Roderick, chief of the Department of Mines, had his entire inspection force in attendance at the Welfare Conference held by the state in the Capitol on Nov. 17, 18 and 19, and he took advantage of the opportunity to discuss the question of accidents and the work during the winter months when the conditions in the mines are more dangerous than at any other period during the year. The present year has been particularly free from accident and it is the desire of the chief of the Department of Mines to continue the good record through the coming winter. The mining industry is becoming more active and with the resumption of operations, greater attention is required to safeguard the workers.

OBITUARY

J. M. Turner, 88 years old, vice-president of the First National Bank of Blairsville, Penn., was instantly killed on Nov. 17, by a Pennsylvania R.R. train on the Indiana branch. He had just left his home, and was desirous of boarding a street car to come in town. In crossing the tracks of the railroad he failed to judge the speed of an approaching train and was struck. Mr. Turner was well known in western Pennsylvania to banking and coal men, having been an operator in his earlier days.

INDUSTRIAL NEWS

Williamsburg, Ky.—The Peerless Coal Co., Inc., announces its progressing dissolution, D. O. Foley, president, at Williamsburg, Whitley County, setling claims, etc.

Washington, D. C.—Reductions in hard-coal rates ordered by the Interstate Commerce Commission to become effective Dec. 1 were postponed Nov. 23 until Jan. 1.

St. Louis, Mo.—The Public Utilities Commission of Illinois announced recently that it would permit the carriers an increase of 5½c. per ton in the rate on soft coal to Alton, Ill., from Illinois mines.

Roanoke, Va.—It is reported here that the rumor current in New York to the effect that the Virginia Iron, Coal and Coke Co. had been sold to the Clinchfield Corporation is false and has no foundation in fact.

Columbus, Ohio—The Toledo & Ohio Ry. Co. and the Zanesville & Western R.R. Co. have filed answers with the Ohio Utilities Commission, denying the charges that rates in Ohio on coal shipments are too high.

Reading, Penn.—The Philadelphia & Reading Ry. has placed an order for 500 steel coal cars. This now makes a total of 1,500 new cars which this company has on order, the above being in addition to the 1,000-car order placed a month since.

St. Louis, Mo.—The general offices of the Madison Coal Corporation, which have for many years been located here will shortly be removed to Chicago. This company is allied with and handles the coal properties of the Illinois Central R.R. Co.

Philadelphia, Penn.—The Midlothian Coal Co., which a year ago commenced operation in the bituminous fields of Huntingdon County, under the control of P. Heilner & Son, has been acquired by W. H. Bradford, and the output will now be marketed by W. H. Bradford & Co., Inc.

Saltsburg, Penn.—The Belmont extension of the Turtle Creek Valley R.R. from Export to near Belmont is complete, and shipments of coal will be made over the new extension in a short time by the Belmont Gas and Coal Co. Belmont residents have petitioned the Pennsylvania R.R. Co. for passenger service over this extension.

Whitesburg, Ky.—The Kentia Corporation, one of the largest holders of coal land in Harlan County, has just leased properties to the Creech Coal Co. and the Banner Fork Coal Co. on Wallen's Creek, several miles from Harlan, and developments are starting with large forces of men. Each of the companies will build good-sized mining towns.

Hazleton, Penn.—Daniel Conlin, of Milnesville, a miner, has brought suit for $40,000 damages against Pardee Bros. & Co. and Robert Fagan, foreman for that firm. While going down a gangway some time ago after completing his day's work Conlin was struck by a blast, which seriously affected his sight and in addition marred his facial appearance.

Pittsburgh, Penn.—The United States Department of Labor is unable to supply the demand for skilled and unskilled workers, and in western Pennsylvania there are opportunities for 1,500 men for work on farms, in the coal mines and in mills. In Fayette County many men are wanted at positions paying from $1.60 to $2.85 per day. Information may be had without charge at the Pittsburgh office.

Cumberland, Md.—It is understood that the Anthony M. Brady Estate of New York has arranged to take over the holdings in Webster County, West Virginia, of Col. John T. McGraw, of Grafton. Through investment in gas and electric companies, the Brady Estate is largely interested in coal for steam purposes, and it is thought that this may have been an influential factor in bringing about the transaction.

Moundsville, W. Va.—The sale of the Johnson coal mine located at Pipe Creek, which was to have been held at the Douglas Savings Bank at Bellaire, Ohio, Nov. 19, was postponed for 30 days. It is understood that the stockholders of the company are trying to get together for the purpose of settling matters, and if this can be accomplished within the time specified the mine will not be sold.

St. Louis, Mo.—The complaint of the Coal Operators' Traffic Bureau of St. Louis, the Southern Coal, Coke and Mining Co., the Lumaghi Coal Co. et al. vs. Chicago, Burlington & Quincy Ry. Co., alleging discrimination in soft-coal rate differentials as between southern Illinois mines and the Belleville group of mines, is set for hearing by the Interstate Commerce Commisison before an examiner in St. Louis on Nov. 26.

Washington, D. C.—Nearly all American by-product ovens are now equipped to produce coal tar bases, from which dyes may be manufactured. This has been due largely to the increased demand for these dyes since the European war started, but in the meantime, however, demand for the same bases to be used in the manufacture of explosives has kept prices so high that the dye stuff industry has been severely hampered.

Pittsburgh, Penn.—Although it is hoped there will be no strike of the miners in the anthracite region when the wage agreement expires next April, many large corporations are laying up a considerable supply of surplus coal. Among these is the Eastern Pennsylvania Railway Co., which has erected a trestle 400 feet long at Palo Alto where coal is being stocked. The scaffold is equipped with a scraper line running along the top which will carry the coal and dump it between the piers below.

Shamokin, Penn.—Two men while repairing a breast in the Hickory Swamp colliery recently were caught in a rush of coal and entombed for nine hours. The work of rescue was directed by R. J. Holland, superintendent of the operation, who worked with the rescue party in a space so small that the coal and refuse had to be removed in buckets. When the men were reached one was uninjured, but it was necessary to remove his companion to the hospital, as he had been bruised and lacerated by timbers.

Pittsburgh, Penn.—The towns on the Ohio River dependent on the Pittsburgh disrict for coal are facing a fuel shortage. For the first time in many years the river operators have announced that no coal was available for water shipment. Because of the industrial activity all the available coal is being used in local plants. Officers of the largest mining companies interviewed held out no hope of an early resumption of shipments to river points, although it was thought a few tows would go out next week.

Philadelphia, Penn.—The car supply in the bituminous trade has become so acute that one of the prominent shippers in this city has adopted a rather novel plan to urge prompt unloading by his customers. In each letter sent out a blotter is inserted, showing in glaring red type the following: "Keep the Cars Moving—Kindly release your cars immediately, regardless of the free time limit, and insist that the railroad move them promptly. This will help you and help our car supply. Short car supply means higher prices."

Louisville, Ky.—The coal-carrying trade has been taking a good deal of interest in the launching for the Inland Navigation Co., of New Orleans, at the Howard Shipyards, Jeffersonville, Ind., of the first of what is described as a fleet of 35 power barges, of large size, operated by oil engines and constructed of steel. The fleet is to be equipped electrically throughout, even to wireless apparatus, and it is said will operate at a rate about 75 per cent. of the rail rates, providing at the same time for transfer of freight from cars to barge, etc.

Philadelphia, Penn.—The case of James H. Minds and Julia A. Matz against the Pennsylvania R.R., in which they sue to recover $65,183.68 allowed them by the Interstate Commerce Commission for car discrimination, has been postponed until the February term. After spending three days in taking testimony a clerical error was discovered in the report from the commission. The error would have in no way affected the evidence and the judge suggested that it be corrected in court. The attorneys for the railroad, however, declined to agree and the case was then held over.

Whitesburg, Ky.—What are apparently well-founded reports are being circulated in this and adjoining counties to the effect that the Virginian R.R. is preparing to extend its line from a point near Bluefield, W. Va., through Buchanan, Va., and the Peter and Levisa Fork region of Pike County, terminating at Shelby Junction, on the Chesapeake & Ohio R.R., a distance of about 65 miles. This is one of the most extensive coal fields in the section now undeveloped. Engineers are reported to have completed the survey and it is expected that the contract will be let in the near future.

Jefferson City—The Missouri Public Service Commission, which recently granted the railroads of Missouri increases of 5 per cent. in freight rates on many commodities, refused the carriers' application for increases on hard coal, soft coal and fuel oil. The coal men also derive advantage from the commission's joint order ruling. The practice has been, when a shipment passed from one railroad to another, for the second road to make the same basic rate as if the shipment originated on that road. Under the joint order the road to which the shipment is transferred must carry it on at the rate which would have been charged for the distance by the road on which the shipment originated, if there had been no transfer.

Coal Trade Reviews

General Review

November anthracite tonnage about normal but the month was a distinct disappointment in the trade. Bituminous improved and little free coal available. Hampton Roads exports touch a new low point. Cold snap counteracts a slowing-up tendency in the Lake trade.

Anthracite—The month of November has been a distinct disappointment to the anthracite trade, although the tonnage statement will very probably show close to a normal movement. A sharp activity was anticipated, but this was dispelled by the mild weather which exerted a depressing effect. Some collieries have already been forced to suspend operation, due to inadequate car supply and a protracted spell of cold weather, such as marked the opening days of the current week, would clean up most of the surplus at the large distributing centers. It is noted that one road has already declared an embargo against all freight, except perishable. Further evidence of the concern felt over the impending wage conferences is noted in the surprisingly few bids received on some large municipal contracts which indicates the distinct hesitancy about commitments beyond Apr. 1.

Bituminous—The simultaneous resumption of activity at a number of industrial plants, together with a continuation of active operations at others, created a mild spurt in bituminous during the past week. Brokers are snapping up any loose tonnages that appear, while the available supply of free coal is steadily becoming more restricted and buyers are obliged to act quickly. The movement is becoming more and more confined to contracts on which shippers are steadily losing ground. The congestion of freight is adding to the seriousness of the situation. The increased demand has accentuated the car shortage, the supply now being a little better than 50% requirements, and this has had a notable tendency to firm up prices still further.

Exports—With the situation as regards ocean freights growing more acute every day, and scarcely any charters being negotiated, prospective exporters are gradually losing interest in the foreign business. There has been an increase in foreign inquiries during the past week, but as these invariably specify that the shippers shall provide vessels, the inquiries are receiving scant attention. The supply at exporting points continues substantially above normal, and the movement both coastwise and export is the source of no little disappointment. The dumpings over the Hampton Roads for last week touched the lowest point at any time since the boom in the export trade began.

Lake Market—There has been a slight tendency to slow down due to the approaching close of navigation and the uncertainty as to an outlet for the coal now going into the Lake trade, but the recent cold snap, accompanied by a snow flurry, together with the continued expansion in the steam consumption, have maintained the market in excellent shape. The car-supply question has now arrived at the point where some roads are being forced to declare temporary embargos against coal shipments in certain directions, until the line can be cleared and the congestion relieved. Inclement weather in the far Northwest has driven consumers into the market, with the result that there has been a notable increase in the shipments out from the upper Lake ports, while arrivals on the other hand have been seriously interrupted by severe storms.

Middle West—The colder weather has caused a sharp rush for coal, and the increased demand has been reflected all along the line back to the mines. Yards are heavily stocked, but the general demand has made a perceptible impression on the surpluses and dealers and jobbers are being gradually forced into the market. Prices are being sustained in the most impressive manner, and the first protracted cold snap will undoubtedly force quotations to new high levels on this movement. Northwestern points are showing renewed interest in the market, and a still heavier demand from the railroads for storage coal has had a stiffening effect on prices. In the few instances where orders are lacking, rigid curtailment is put into effect.

A Year Ago—The cold snap failed to precipitate the expected activity in anthracite. Some favorable developments in bituminous but still much pressure to move tonnage. High ocean rates restrict foreign shipping.

BUSINESS OPINIONS

Boston News Bureau—It is a rather peculiar situation. Reports from general trade continue favorable. There is a strong demand for commodities both from foreign and domestic sources. Prices of raw and manufactured products are advancing rather than declining. The activity has resulted in no impairment of money; in fact, the facilities are present for a much greater expansion of credit. Sterling exchange holds fairly firm, considering our enormous credit balances. Railroad earnings are commencing to feel the general business betterment. Looking for vulnerable spots, the most adverse feature is, of course, the war. Attention is closely riveted on the Balkan situation.

Dry Goods Economist—With conditions everywhere reported as strongly on the up-grade, retailers throughout the country are entering on the holiday season with decided optimism. There is every indication, indeed, that stores in every section will have an unusually good business, while in some centers it bids fair to be phenomenal. Orders with manufacturers and wholesalers, as is usual at this period, are of a filling-in character, though attention is being given to such new lines for spring as are now being offered.

American Wool and Cotton Reporter—Still strong with an upward tendency, the wool market is most emphatically a sellers' one. Prices continue to harden slowly. Standard Australian, grease, and foreign wools and in fact any regular grade meet with a ready market. A dealer in pulled wools sold a quantity during the week under review at the best prices of the season, and, in fact, during the same week, the best prices for all time. Dealers who have been holding territory wools are now realizing the profits on them. Manufacturers are beginning to realize that Boston is the cheapest market in the world.

Bradstreet's—Further progress in trade accompanies greater industrial activity, higher prices, better collections, increased demand for money, record bank deposits, sharp reduction in unemployment, heavier payrolls, a big movement of grain, and lower temperatures over a wide area, which latter has given snap to retail trade in seasonable wearing apparel. Rain has helped winter wheat, and cold weather far south has put a period to cotton growth. Final purveyors, short of goods as they are, and feeling certain of sustained growth in business, are buying freely from wholeale houses as well as from jobbers.

Dun—Fresh impetus to the forward movement is imparted by lower temperatures in many sections, which stimulate the demand for all classes of seasonable merchandise, notably clothing, footwear and fuel. As retail distribution quickens and broadens, wholesale departments in turn benefit and reports from all parts of the country are remarkably uniform in disclosing progressive improvement. Not only does business continue highly favorable in actual performance, but there is every promise, especially in industrial lines, of a degree of expansion limited only by facilities.

Marshall Field & Co.—Current wholesale distribution of dry goods is well ahead of a year ago—more seasonable weather being a factor in the increase. Road sales are heavy for immediate delivery, and are showing handsome increases for spring delivery. Customers have been in the market in about equal numbers to last year. Collections are improved. Merchandise is scarce in many lines, and prices are advancing.

The Southern Lumberman—While numerous price advances have been made by individual mills during the past week, especially on such stock as those particular mills happen to be short on, the general level of prices has remained practically at the advances announced last week, the only further increases being noted on No. 2 boards and in certain items of dimension. All car material has been in particularly good demand the past week, with especial call noted for decking. The market for hardwood lumber has shown no great change during the past week, the steadily increasing and well-distributed demand which has been noted for the past several weeks continuing.

ATLANTIC SEABOARD

BOSTON

Pocahontas and New River demand rather flat, although prices are more consistent. Boston, Mystic Wharf, price war still effective. Georges Creek in good supply, except all-rail. Most of Pennsylvania grades sold up for present. Water freights continue high. Delays beginning on anthracite.

Bituminous—There is no snap to the market on Hampton Roads coals. While a fair volume is coming forward on contracts there have been further accumulations at the loading piers on account of the slow movement of vessels. Car supply, too, on the Southern roads has been excellent. The demand for the smokeless coals seems to have flattened out the past fortnight or so, even the export trade failing to materialize. At the same time there are distributors in this territory who are behind on their orders, although not yet to the extent of chartering at current freight rates. Practically the only spot demand is among the shippers themselves, trading as they happen to be long or short for the time being. Prices show no change, although possibly the $2.85 f.o.b. basis for current sales is more consistently maintained than a month ago.

The Pennsylvania situation is developing faster than was expected. The shortage of cars has been given so much publicity that consumers everywhere have been trying to accumulate coal and with this extra demand at a time when most mines are getting only about 60% of the usual car supply, the operators have their hands full. Some of the larger consumers are getting apprehensive and early in the week there were such strong efforts to secure options in anticipation of a flurry that practically none of the shippers would take new business at any price. As high as $1.75 has been paid for fair grade Clearfields and there is every prospect of higher prices soon. One or two blocking snowstorms would make things look interesting.

Water Freights are nominal at $1.10, Hampton Roads to Boston, on large vessels, and very little tonnage available. It is felt the advance is due to those shippers who let their steamers go off-shore and now are obliged to replace them with other carriers. The flurry in coastwise rates therefore is a direct result of the high ocean freights that have prevailed all season.

Anthracite—The continued high winds have put the shipping companies behind on their orders, and from now on there will probably be delay in filling requisitions. The volume of bituminous coming forward from Philadelphia is curtailing the amount of barge tonnage available for anthracite from that port, and if retailers here had not been forehanded during the summer many of them would now be anxious over supplies.

Bituminous quotations, f.o.b. loading ports at points designated, are about as follows per gross ton:

	Philadelphia	New York	Baltimore	F.o.b. Mine
Clearfields	$2.40@2.85	$2.65@3.10	....	$1.10@1.75
Cambrias and Somersets	2.50@3.05	2.75@3.30	....	1.30@1.80
Georges Creek	2.92@3.02	3.22@3.32	$2.85@2.95	1.67@1.77

Pocahontas and New River prices, on cars Boston, are $3.65@3.83; Providence, $3.63@3.78; and f.o.b. loading ports at Hampton Roads, $2.80@2.85.

NEW YORK

Anthracite market active with good prices. Demand heavy and little coal at Tidewater. High grades steam coals scarce due to freight congestion. Dealers not bidding on city business. Bituminous situation bracing up. Higher prices looked for. Operators handicapped by car and labor situation.

Anthracite—There is considerable activity in the hard coal market both at Tidewater and on the line. While there has been no great delay in filling orders, shippers are becoming worried and a few days of weather similar to that in the early part of the week would clean up the little surplus now on the docks. All sizes are active and the high grade steam sizes are practically out of the market.

Shippers are anxious about getting coal forward, but the congestion on the railroads is holding everything back. One road has already ordered an embargo on all shipments excepting perishable freight and live stock.

That dealers are looking well into the future was demonstrated this week when bids were opened by city authorities for nearly 8,000 tons of hard coal. Only 11 bids were received, most dealers preferring not to commit themselves as to deliveries with the working agreement of the miners expiring on Apr. 1. Dealers in large tonnages of the steam sizes are hesitating about closing new contracts. One dealer quoted prices 15c. higher than those now existing and much to his surprise was accepted.

Shippers are practically selling from hand to mouth, but the situation is not as yet causing any serious trouble. Stove and nut sizes are the shortest and command slight premiums. Egg is the longest and stray lots have been quoted at from 5 to 10c. below company circulars. Pea is in good demand. Of the buckwheat coals, No. 3 is practically out of the market except some of the cheaper grades and these are bringing nearly full circular.

Current quotations, gross tons, f.o.b. Tidewater, follow:

	Lower Ports		Upper Ports	
	Circular	Individual	Circular	Individual
Broken	$5.05		$5.10	
Egg	5.30	$5.20@5.30	5.35	$5.25@5.35
Stove	5.30	5.25@5.30	5.35	5.30@5.35
Chestnut	5.55	5.40@5.55	5.60	5.50@5.60
Pea	3.50	3.25@3.50	3.55	3.50@3.55
Buckwheat	2.75	2.25@2.75	2.80	2.25@2.80
Rice	2.25	1.85@2.25	2.30	2.00@2.30
Barley	1.75	1.50@1.75	1.80	1.75@1.80

Bituminous—Prices are on the up-grade and little coal, except the cheaper grades, can be had at less than $2.85 f.o.b., while the majority of the coals touched the $3 mark or more. There is a limited supply and buyers have to act quickly. Boats are scarce and freight rates are stiffening. Operators are doing their utmost to keep up with the demand, but their efforts are curtailed by the car and labor difficulties. The labor question is becoming more uncertain as the season advances and freight congestion is adding to the seriousness of the situation .

Mine quotations are stronger and $1.35 is about the lowest figure noted for low-grade coals. Line quotations are about 5c. less than at Tidewater. If temperatures continue low Tidewater quotations will be higher next week.

Current quotations, gross tons, f.o.b. Tidewater for various grades, are about as follows:

	South Amboy	Port Reading	St. George	Mine Price
Georges Creek Big Vein	$3.20@3.30	$3.20@3.30	$3.20@3.30	$1.75@1.85

Western Maryland		2.75@2.85	2.70@2.80	1.20@1.30

PHILADELPHIA

Warm weather affects anthracite, but good tonnage moving. Movement slow and short car supply closes some mines. Egg and nut slightly off. Stove well held and pea firm at $2.25. Bituminous active, but car supply short.

Anthracite—Business for November has been somewhat disappointing. Several weeks of mild weather is sure to have a depressing effect on the market, and both shippers and retailers have been annoyed at the slack business. Despite the fact that there has been no exceptional activity there has been much complaint of slow deliveries. In many instances coal has been in transit a week or more. When severe weather sets in and the real rush comes, there is sure to be trouble. Besides delays on the railroads, heavy orders from the consumers will be a tax on teams and motortrucks, with the added expense of extra help and late hours in the yards. The car supply became so acute this week that a number of collieries had to close down completely. One of the largest companies had six operations idle for half the week, with the prospect that a further shut-down would be necessary.

Confidential information is to the effect that it has been a distinct effort on the part of the retail men to keep their credits in high standing. But the dealers feel that the extra effort at this time will be well worth while in event of a suspension. If the state tax is finally refunded it will be more of a windfall than some would care to admit. Two lean years, including several cut-price campaigns have made profits dwindle most discouragingly. It is now understood that there is small probability of any of the refund being made before a year or more at the least. It will take six months for the court to act on the request for a rehearing and if it is then allowed it will take a year to re-submit the case.

Broken, as usual, is being well cared for. Egg coal is moving in fair volume, although several sales are noted at from 15c. to 25c. below regular circular. While stove coal is still in demand the rush on this size has slowed down for the time being. Chestnut has been weaker and in some instances has been sold to the larger buyers at a slight reduction, including tax off. Pea coal has undeniably stiffened and no new orders are being taken at less than $2.25 and tax. Of course this does not in any way affect the big business which is protected up to Jan. 1 at $2 and tax. The time is rapidly approaching when the dealers who are now selling this size at $4.50 and $4.75 in their customers' cellars will see what a poor business proposition it is to sacrifice their advantage in buying.

The circular prices per gross ton at mines and for the tide shipments f.o.b. Port Richmond are as follows:

	Line	Tide		Line	Tide
Broken	$3.50	$4.75	Pea	$2.50	$3.25
Egg	3.75	5.00	Buckwheat	1.50	2.25
Stove	4.00	5.00	Rice	.85	1.75
Chestnut	4.15	5.25	Barley	.50	1.50

Bituminous—The trade was given a decided impetus this week, due apparently to a simultaneous resumption at a number of industrial plants. The sudden spurt served to accentuate the difficulty of the car supply, and on account of the inability to fill orders the prices on all grades naturally showed an increase, with one or two exceptions.

Prices per gross ton, f.o.b. mines, are as follows:

Georges Creek Big Vein	$1.75@1.85	Fairmont gas, ¾	$1.35@1.45
South Fork Miller Vein	1.55@1.65	Fairmont gas, mine-run	1.20@1.25
Clearfield (ordinary)	1.40@1.50	Fairmont gas, slack	1.00@1.05
Somerset (ordinary)	1.35@1.45	Fairmont lump, ordinary	1.15@1.20
West Va. Freeport	1.25@1.30	Fairmont mine-run	1.05@1.10
		Fairmont slack	1.00@1.05

BALTIMORE

Car supply still below 66%. Vessels scarce. Restricted sales and growing demand send prices upward.

With a car supply in Western Maryland, Pennsylvania and West Virginia during the past week that averaged about 60% of actual requirements, shippers fell behind still farther on contract obligations the past week. The Thanksgiving holiday helped the railroads to catch up somewhat on the movement.

Slow deliveries are beginning to tell on the anthracite trade. There is also a growing belief that a strike is inevitable in the spring. It would not be at all surprising to see an advance in prices above what is the usual high winter rate. While yard supplies are still fair, a cold wave would soon wipe out the better part of this reserve.

Prices in gross tons to the trade may be quoted about as follows:

	Mines	Balt.*
Geo. Crk. Big Vein	$1.80	$2.98
Geo. Crk. Tyson	1.50	2.68
Clearfield	1.30	2.48
South Fork	1.45	2.63
Latrobe	1.25	2.33
Somerset (best)	1.40	2.58
Somerset (good)	1.25	2.43
Quemahoning	1.45	2.63
Freeport	1.20	2.28
Miller Vein	1.30	2.38

Fairmont	Mines	Balt.*
Ordinary mine run	$1.00	$2.38
Ordinary ¾	1.10	2.53
Ordinary slack	1.00	2.43
Low sulphur mine-run	1.25@1.30	2.68@2.73
Low sulphur ¾	1.40	2.83
Low sulphur slack	1.00@1.05	2.43@2.48

* F. o. b., outside Capes.

HAMPTON ROADS

Export shipments light. Government takings fair. New Custom House ruling concerning bunkering.

Coal shipments from tidewater have not been as heavy as expected, both as regards export and coastwise movement. The government, however, has taken a fair quantity, having loaded two large colliers and a quantity of coal for bunkers. The coastwise movement, as usual, has gone to the New England ports, the largest amount going to Boston and Providence, with other fair shipments to Salem, Fall River, Pawtucket, Lynn and Plymouth.

The accumulation at tidewater is still above normal, although a number of shippers with large contracts to take care of have at times during the week been short. The largest portion of the coal moving has been Pocahontas and New River mine-run, with some few cargoes of nut and slack and high volatiles. Of the high volatile coal, there is only a small amount on hand, but there is little demand for this grade in any case.

Notice has been received by local shippers that after Nov. 17 vessels calling at this port for bunker coal only would not be compelled to enter and clear at the Custom House unless remaining in port more than 48 hr. This notice will be of great assistance to shippers where steamers arrive after Custom House hours and will mean a great saving in time to the owners of the vessels.

Railroad Tonnages—Dumpings over the local piers for the past five weeks compare as follows:

	Week Ending				
Railroad	Oct. 23	Oct. 30	Nov. 6	Nov. 13	Nov. 20
Norfolk & Western	163,920	126,145	120,590	133,329	100,598

OCEAN FREIGHTS

The freight situation grows more acute daily, and although we occasionally charter a steamer for export coal, it is more than difficult to secure tonnage even at the high rates now current.

We would quote freight rates on coal by steamer as follows:

To	Rate	To	Rate
Havana	$2.75@3.25	Bermuda	$3 50@ 4.00
Cardenas or Sagua	3.00@3.50	Vera Cruz	5.00@ 6.00
Cienfuegos	3.25@3.75	Tampico	5.00@ 6.00
Port au Spain, Trinidad	4.00@4.50	Rio	10.80@11.40

St. Thomas	3.50@4.00	Montevideo	12.00
Barbados	4.00@4.50	Buenos Aires or La Plata†	12.00
Kingston	3 50@4.00	Rosario	13.20
Curacao	4.00	West Coast of Italy	19.20@20.40
Santiago	3.50@4.00	Barcelona**	18.00@19.20
Guantanamo	3 50@4.00	Valparaiso or Callao	11.00@12.00
Demerara	6.00@7.00	Marseilles	19.20

* Consignees paying dockage dues. ** Spanish dues for account. † Quotations on Plate coal by British steamers; neutral steamers are more difficult to obtain and the rates are always higher.

W. W. Battie & Co.'s Coal Trade Freight Report.

LAKE MARKETS

PITTSBURGH

Domestic demand improved. Operations at 75% with fair labor supply and more car shortages. Stock of slack small. Scarcity of Lake vessel tonnage for 1916 predicted.

Domestic demand has improved materially with colder weather and is now about normal. Line demand shows no material improvement, while railroad consumption is a trifle heavier.

Car shortages are still more in evidence and more or less of a congestion is likely in the next few weeks, until cars tied up in the Lake trade are all returned. There has been no noticeable softening in the market by reason of the approaching close of Lake shipments, but the market is certainly not stronger, except as to slack, which is scarce already and is likely to have to be made by crushing before the winter is over. Some stocks have been accumulated at mines, but far less than the usual quantities. Labor supply is fair and operations are at about 75% of capacity.

We quote free coal as follows: Slack, 85@95c.; mine-run, $1.15@1.20; ¾-in., $1.25@1.35; 1¼-in., $1.35@1.45; contract coal, to Apr. 1: Slack, 90c.@$1; nut, $1@1.10; mine-run, $1.15@1.25; ¾-in., $1.20@1.30; 1¼-in., $1.30@1.40, all per net ton at mine, Pittsburgh district.

While it is taking a far look ahead, it is of interest to note that the iron industry expects a very heavy movement of iron ore down the Lakes next season, limited only by the capacity of the fleet, and it is stated in iron ore circles that an unusual proportion of the boats will go up the Lake light, so that there may be difficulty in moving coal. Already a great deal of vessel tonnage has been chartered for ore.

BUFFALO

General dullness in bituminous, but it is not expected to last. Anthracite varies with the weather. Lake closing will form new basis.

Bituminous—The trade has been dull for a week or so though almost everybody regards this as a temporary condition. At the same time the approaching end of the Lake season has the usual influence; when the shipments to the Lakes stop there will be a large amount of additional coal, with slack leading, thrown on the market. It is quite possible that some of the Lake shippers have already anticipated the situation and sent their surplus this way. Other dealers who are extensive operators deny that the dullness amounts to anything and report that they are short of coal. The car shortage is still increasing and should there be an early period of snowy weather there are indications of a runaway market.

Prices are not so strong as they were a week ago, though not declining:

	Pittsburgh	Allegheny Valley	Penn Smokeless
Lump	$2.80	$2.50	$2.55
Three-quarter	2.65	2.30	.....
Mine run	2.55	2.20	2.30
Slack	2.15	1.90	2.30

Quotations are f.o.b. cars at Buffalo or the Niagara bridges and per short ton except east of Rochester or Kingston, Ont.

Anthracite—The trade is very unsteady, on account of the continued return of mild weather; when it snows the demand is good, but it falls off just as soon as the sun comes out. Independent jobbers find it easy to get standard prices, but hard to get the coal. The car shortage has much to do with this. Anthracite shippers are decidedly uneasy over the tax complications and look for troublous times before the matter is straightened out. Some of them did not pretend to add the tax to their prices and claim they are exempt from any refund. Prices remain strong as follows: Grate, $5.60; egg and stove, $5.85; chestnut, $6.10; pea, $4.30; buckwheat, $3.25, per long ton, f.o.b. cars, or with 25c. additional for delivery on board vessel. Prices include the Pennsylvania state tax.

Lake shippers of anthracite are anxious to continue till the end of navigation, but though the fleet is large here, on account of the great amount of grain arriving, coal rates are advancing. Tonnage to Lake Michigan is difficult to get at any rate. Lake shipments for the week were 104,750 tons. Shippers will remain in the market till the end of the season.

TORONTO, CAN.

Colder weather helps the trade. Navigation practically closed.

The colder weather has resulted in an increased demand for anthracite. Dealers are keeping large stocks on hand in view of an anticipated rise in prices, so that the car shortage does not materially affect present conditions. Large consumers have been urged to prepare for increased prices and delayed deliveries by stocking up more freely, but as a rule prefer to buy only for immediate requirements. Navigation has practically closed for the season and only few more consignments will be received by water. Slack continues much in demand.

Quotations per short ton for best grades are: Retail, anthracite egg, stove and nut, $7.75; grate, $7.50; pea, $6.50. Bituminous, retail steam, $5.25; screenings, $4.25@4.50; domestic lump, $6; cannel, $8. Wholesale, f.o.b. cars at destination, three-quarter lump, $3.79; screenings, $3.15.

COLUMBUS

More strength in domestic lines, due to lower temperatures. Steam trade is still good and the market is generally satisfactory. Prices firm all along the line.

With the coming of colder weather, dealers are having a better trade, which is reflected upon the operators by larger orders. Generally speaking, retail stocks are not large and a little movement forces the dealers into the market. Many orders are accompanied with requests for immediate shipment.

Orders for steam tonnage are also gradually increasing as manufacturing continues to expand. Railroads are buying more and producers believe that demand will continue to improve. Prices all along the line remain strong and there are some indications of an advance shortly.

The Lake trade is coming to a close. There is still about a week for the shipment of stocks to the Northwest, but the time is limited. The season on the whole was not as active as previous years, althought a considerable tonnage was shipped to the head of the Lakes.

Retail prices are firm and all changes are toward higher levels. The contract season is expected to open with a rush shortly after the first of the year, as many contracts expire about that time. The car shortage which has been delaying shipments is apparently growing worse. Many shippers look for a real stringency in cars in the near future.

Prices in Ohio fields f.o.b. mines, per short ton, are as follows:

	Hocking	Pomeroy	Eastern Ohio	Kanawha
Re-screened lump	$1.60	$1.65	.....	.....
Inch and a quarter	1.50	1.50	$1.35	$1.50
Three-quarter-inch	1.35	1.40	.....	1.35
Nut	1.25	1.30	.....	1.25
Mine-run	1.15	1.20	1.05	1.10
Nut, pea and slack	.70	.75	.65	.60
Coarse slack	.60	.65	.55	.50

Mines have been working at about the following percentages of full capacity:

District	Week Ended				District	Week Ended			
	Oct. 30	Nov. 6	Nov. 13	Nov. 20		Oct. 30	Nov. 6	Nov. 13	Nov. 20
Hocking	65	60	50	60	Cambridge	65	70	70	75
Jackson	50	45	40	45	Massillon	70	70	70	75
Pomeroy	90	85	85	85	Eastern O.	80	80	75	80
Crooksville	65	65	65	65	Average	69	68	65	69

TOLEDO

Insurance protection on Lake boats expires Dec. 10. Ohio mines operating well. Market stiffening.

Business, especially among the retail yards, has been better, owing to the colder weather. There has been no change in prices, although all lines are holding a little more firmly to the list than has been the case. Pocahontas has been inclined to be a little soft in the prepared sizes, although there is a fair general demand. West Virginia has been much stronger so far as steam lines are concerned, although the domestic grades have shown some weakness. There is a marked stiffening on slack, which is in strong demand and small supply. There is much complaint here of car shortage and the late Lake trade has been greatly retarded owing to the difficulty experienced in securing sufficient cars to move the coal.

The Lake season is nearing its close, as insurance on Lake-going vessels will expire Dec. 10. The Lake trade on coal has been fairly strong despite fears early in the season that the business would be light. Late fall trade has been good and an immense amount of coal has been handled at the Toledo docks.

Reports from Sandusky state that a rush of coal to the north began several weeks ago, but has been interrupted recently by severe storms. A number of coal boats due at the Pennsylvania docks in that city were held up this week due to that cause.

DETROIT

Better conditions in the steam coal trade. Cold weather brings more sales of domestic and anthracite. Vessels scarce in Lake trade.

Bituminous—Improvement in demand for steam coal is noted. Although the buying is not greatly increased, the orders are more regular than during the last few weeks. Lack of adequate railroad equipment is causing a silght delay in deliveries. Despite the announcement of a temporary embargo, some of the shippers fear it will be lifted only to be renewed.

Frosty weather, snow and cold rain have imparted a stimulating influence to the domestic trade. Retailers are doing a larger business and shippers look for renewal orders soon. Very little consignment stock is now coming to forced sale.

Anthracite—Consumers of anthracite are still buying somewhat cautiously, although colder weather has braced up the market. Retail stocks seem to be holding out well, as the shippers are getting only a small amount of new business.

In the Lake trade, shippers are having much trouble getting vessel capacity, as carriers have lost so much time recently in storms that they are running behind on ore and grain schedules.

CINCINNATI

Colder weather has increased domestic demand and inquiries are heavier. Car supply becoming tighter and a shortage of fuel is predicted.

The coldest weather of the season has caused a marked increase in the demand for domestic coal and brought the retailers into the market in considerable numbers. With the totally inadequate car supply this increased demand has accentuated the relative scarcity of fuel, and from now on the demand is very likely to run considerably ahead of the supply. Prices are stiffening daily, although in some cases quotations have little reference to actual movements, because of the inability of some of the mines to make deliveries. The turn in the market has apparently come, and consumers who have delayed buying will probably find that they waited too long.

LOUISVILLE

Lower temperatures stimulate domestic business. Prices stronger.

Arrival of cooler weather has helped the Kentucky market considerably, especially on domestic coals. Steam sizes have been very much in demand for the last several weeks and prices are advancing. Sales for the week, long-ton basis, f.o.b. mines, have been recorded at from $1.75 to $2.10, with $1.85 a price prevailing on a considerable proportion. Nut and slack is selling at from 50c. up. There is said to be virtually none of the low grades on the market.

COKE

CONNELLSVILLE

Prompt furnace coke still easier. Contract business practically all closed. Foundry coke steady with fair demand. Production and shipments slightly heavier.

The market for furnace coke for spot or prompt shipment has weakened further. Demand was light at the close of last week and is no better this week. Operators have in several cases accumulated fair surpluses, which they are holding as well as they can. Production appears to be heavier, as the men are working well to accumulate some Christmas money, and consumption is not increased. It appears that if there is to be any shortage of coke it will fall in January rather than before Christmas. Fannie furnace, West Middlesex, Penn., has gone into blast, and McKeefrey at Leetonia, O., is to blow in shortly, but it is understood both furnaces are covered for coke. Corrigan, McKinney & Co. have contracted for the remainder of their coke for 1916 and with this business and that of the Youngstown Sheet and Tube Co., reported last week, out of the way there is hardly any more contract business, to be done.

Foundry coke is in fair demand, perhaps in better demand than a fortnight ago. There is no rush to cover on contracts for the first half of 1916, as operators advanced prices before buyers showed much interest and the buyers now feel they can do as well later in the year as now. We quote: Prompt furnace, $2.15@2.25; contract furnace, first half, $2.35@2.50; year, $2.25@2.35; prompt and contract foundry, $2.90@3.15, all per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Nov. 13 at 427,381 tons, an increase of 3,219 tons, and shipments at 430,503 tons, an increase of 4,410 tons.

Buffalo—The trade is brisk and prices firm. Many ovens are sold to capacity. There is practically no stock coke offering, except some ovens that are selling a little 48-hr. product as stock. Best 72-hr. foundry sells at $5 up.

Columbus—There is an increasing demand for coke and prices are advancing.

Chicago—Coke continues to be in urgent demand, with jobbers and dealers selling all they can obtain at high prices. Gas house and byproduct sizes are strong, and there does not seem to be enough foundry coke available for this territory. Much higher prices are predicted. Prices per net ton of 2,000 lb. f.o.b. cars Chacago, are as follows: Byproduct, foundry, $5.50@5.75; byproduct domestic, $4.75@5; Connellsville, $5.50; Wise County, $5.25@5.50; gas coke, $4@4.25.

MIDDLE WESTERN

GENERAL REVIEW

Colder weather stimulates interest. Domestic coals easy. Steam buying stronger. Eastern coals spotty.

A substantial drop in the temperature has brought about increased buying in domestic coals, though these sizes are not moving as rapidly as anticipated; but undoubtedly they will gain momentum if seasonable weather continues. Yard sales have been brisk, and if the low temperature continues wholesalers will soon be very active replenishing stocks. Yards are heavily stocked, but these stocks have decreased perceptibly during the last few days.

The demand for steam coals has improved with prices firmer. Some of the railroads are taking more storage coal, which stiffens the steam market. Screenings have strengthened generally, the advance being from 10c. to 15c. per ton. Shortage of labor, and lack of cars becomes more acute with every snow flurry. Northwestern lines have issued orders to prevent their cars from going East.

In the Northwest a fair demand exists, but there is not the snap to the trade which undoubtedly will be found later when real winter arrives. Nebraska and far Western points have shown indications of renewed buying. Shipments to Chicago from Indiana and Illinois mines have been below normal the last ten days. Prices of all grades of Western coals are maintained in an unprecedented manner, and even with the accumulations of the past two weeks no concessions of any consequence have followed. Curtailment of production is the rule where lack of orders exists.

INDIANAPOLIS

Touch of colder weather causes an increase in demand for domestic lump. Screenings prices higher. Steam grades being stored. Industrial demand grows.

The weather has been a little sharper and the movement of domestic coal has been much improved. The recent mild weather, and consequent reduced output of domestic coal, apparently cleaned up any surplus screenings and these are now selling stronger. The larger companies report that they are selling Nos. 5 and 6 at not under 70c. in the open market, f.o.b. mines, with 85c. the minimum for No. 4, mine-run averages about $1.10 for Nos. 5 and 6, and No. 4 about $1.15; 1¼-in. steam lump sells up to $1.35 and domestic lump at $1.50 to $1.60.

The car shortage is still troublesome and is curtailing the output. Operators believe they already observe a tendency to store on the part of the steam consumers, in anticipation of the biennial wage conference. The increased operation of factories is spreading. Retailers are not able to say whether there will be any advance Dec. 1 as has been customary for many years, except during the last two or three winters.

CHICAGO

Smokeless softer. Anthracite improves. Southern Illinois screenings strong at higher prices. Indiana coals maintain their position.

Diminished production of Franklin, Williamson and Saline County mines has increased the price of screenings at least 10c. per ton. Operators are still dumping fine grades of coal on the ground instead of sending it to the markets, thus releasing equipment without forcing declines. Nut, pea and slack continue stronger than at this time last year. Domestic lump has been quiet up to the last two days, when orders commenced to arrive more freely.

Springfield screenings have not been sold below 60c., and lump coal is held firmly at $1.75. Increased orders during the last few days of the week have helped the situation materially, and the railroads are reported to be taking storage coal in large quantities from this field.

Car shortages are reported at Indiana mines, averaging a loss of one operating day per week from this cause. The storage supply of retail coal in Indiana cities is unusually low, the big industrial consumers depending mostly on daily shipments, and the yard stocks much less than usual. Knox County mine-run and screenings have been strong; Clinton and domestic lump and screenings have been in steady demand, but steam lump quiet. Sullivan and Greene County domestic lump have had a much better demand the last three days of this week owing to colder weather.

Pocahontas and New River smokeless coals have been softer, with lump selling as low as $1.60, and egg in a somewhat better position. Mine run is generally being sold close to list price. Pennsylvania smokeless coals are scarce and sell strictly at schedule, owing to continued car shortages. Kanawha splint lump is steady.

The average prices quoted on Kentucky 4-in. block are from $1.85 to $2.05; mine-run 95c. to $1.10. Fine coal and slack is strong, and egg is running about $1.50.

The anthracite demand is improving, and shipments now reaching this center about keep pace with orders.

Quotations in the Chicago market are as follows:

	Williamson and Franklin Co.	Springfield	Sullivan	Clinton	Knox and Greene Cos.
Lump	$1.65@1.75	$1.65@1.75	$1.50@1.60	$1.35@1.50	$1.40@1.55

W. Va., Splint Lump, $1.50@1.60.

ST. LOUIS

Colder weather sustains the market at a critical moment. Outlook regarded as optimistic.

A touch of winter moved what coal there was on track and held the prices steady just when there seemed danger of a break. The dealers kept their eyes on the thermometer and the forecasts and did not stampede. The first sustained cold spell will create a strong demand and force prices up.

Quotations f.o.b. mines during the past week have ranged on the following basis per short ton:

	Frnk. Co.	Wlmson. Co.	Staunton	Standard
6-in. lump	$1.50@1.75	$1.50@1.75	$1.25@1.35	$1.20@1.25
8-in. lump	....	....	....	1.25

Freight Rates—Inner group, St. Louis, 57½c.; East St. Louis, 37½c. Outer group, St. Louis, 72½c.; East St. Louis, 52½ cents.

DULUTH

Demand is steady. Season of navigation is almost over. Dealers and consumers beginning to stock.

There has been a material growth in shipments and the demand for all grades has increased. The householder and retailer has turned his attention to the coal bins and finds that a large number of the grades were missing, hence the shipments to country dealers and to retailers at interior points were quite heavy during the past week. Receipts have been light, the storms that have prevailed over Lake Superior for the past week having interfered greatly with arrivals. Prices remain firm, the circular being well maintained, this being especially so of the prepared sizes. The railways absorbed a fair tonnage during the week all of which was moved to storage plants at interior points. Quotations are as follows:

	Yough	Splint	Hock	Smokeless	Elkhorn
Lump	$3.40	$3.40	$3.40	$4.75	$3.75
Dock run	3.10	3.10	3.10	3.25	3.25
Stove or nut	3.40	3.40	3.40	4.75	3.65
Screenings	2.40	2.50	2.22	2.75	2.40

Colder weather during the past week has given an impetus to the movement of anthracite and all the dock companies report a brisk inquiry for this class of fuel. Quotations per short ton f.o.b. Duluth are as follows: Nut, $7.10; egg and stove, $6.85; pea, $5.55 and buckwheat, $4.

PRODUCTION AND TRANSPORTATION STATISTICS

CHESAPEAKE & OHIO RY.

The following is a comparative statement of the coal and coke traffic from the New River, Kanawha and Kentucky districts for September and the three months of the fiscal years 1914 and 1915, in short tons:

	September				Three Months			
Destination	1915	%	1914	%	1915	%	1914	%
Tidewater	425,526	20	384,246	19	1,414,506	22	985,701	17
East	201,715	9	227,959	11	554,378	9	608,893	10
West	1,360,630	63	1,241,932	62	3,971,960	61	3,898,894	66
Total	1,987,871		1,854,137		5,940,844		5,493,488	
From Connections								
Bituminous	175,087	8	149,628	8	513,395	8	414,845	7
Anthra. (local)	467				605			
Anthracite	1,487		2,526		4,475		5,270	
Total	2,164,912	100	2,006,291	100	6,459,319	100	5,913,603	100
Coke	30,366		13,439		77,336		59,653	

VIRGINIAN RAILWAY

Total shipments of coal over the Virginian Ry. for September, amounted to 393,055 tons, which compares with 411,090 tons for the previous month and 361,906 tons for September of 1914.

NORFOLK & WESTERN RY.

The following is a statement of coal handled by the N. & W. Ry. during October and the past four months in short tons:

	July	August	September	October
Pocahontas Field	1,648,551	1,721,573	1,620,362	1,720,613
Tug River District	361,454	337,585	354,981	375,743
Thacker District	265,743	227,312	230,198	264,619
Kenova District	80,009	80,152	89,921	95,438
Clinch Valley District	146,911	151,804	144,234	142,187
Other N. & W. Territory	2,651	4,239	3,798	4,636
Total N. & W. Fields	2,505,319	2,522,665	2,443,494	2,603,236
Williamson & Pond Creek	86,949	89,785	87,152	95,188
Tug River & Ky. R.R.	....	....	....	60,050
All other railroads	262,177	348,124	324,913	268,762
Grand total	2,854,445	2,960,574	2,855,559	3,027,236

Distribution of shipments for August and September follows:

	August			September		
	Shipped	Tipple	Total	Shipped	Tipple	Total
Pocahontas	1,599,007	12,439	1,611,446	1,499,081	12,870	1,511,951
Tug River	337,585	2,830	340,415	354,981	3,015	357,996
Thacker	227,312	7,172	234,484	230,198	5,753	235,951
Kenova	80,152	9,819	89,971	89,921	9,586	99,507
Total	2,244,056	32,260	2,276,316	2,174,181	31,224	2,205,405

Shipments of coke entirely from the Pocahontas field amounted to 59,253 tons in August and 55,971 in September.

PENNSYLVANIA RAILROAD

The following is a statement of shipments over the P. R.R. Co.'s lines east of Pittsburgh and Erie for October of the current year and the ten months of 1914 and 1915, in short tons:

	October		Ten Months	
	1915	1914	1915	1914
Anthracite	1,084,739	1,047,340	8,687,790	9,067,445
Bituminous	4,304,466	3,976,192	35,983,366	37,840,834
Coke	1,225,848	716,010	9,604,424	8,277,868
Total	6,615,053	5,739,542	54,275,580	55,186,147

FOREIGN MARKETS

GREAT BRITAIN

Nov. 12—Conditions remain generally quiet and there is no indication of an early improvement. Quotations are approximately as follows:

Best Welsh steam	Nominal	Best Monmouthshires	$4.32
Best seconds	Nominal	Seconds	4.20
Seconds	$4.32	Best Cardiff smalls	2.52
Best dry coals	5.64	Cargo smalls	1.68

The prices for Cardiff coals are f.o.b. Cardiff, Newport or Barry, while those for Monmouthshires descriptions are f.o.b. Newport, both net, exclusive of wharfage.

Freights—Outward chartering is more active, but tonnage is still inadequate. Rates are approximately as follows:

Gibraltar	$6.96	Naples	$10.80	St. Vincent	$7.20
Marseilles	9.84	Alexandria	12.00	River Plate	9.60
Algiers	9.07	Port Said	12.00		
Genoa	10.80	Las Palmas	6.24		

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

✚Indicates contracts regarding which official information has been received.

Recast

In the following table we give a list of all old contracts coming up for consideration during the ensuing week. The table gives our contract number, the name of the purchaser, city, tonnage and page on which the detail notice appeared:

No.	Purchaser	City	State	Tonnage	Page
1503	A. H. Andrews Co.	Chicago	Ill.	6,000b	736
1601	City Government	Cameron	Mo.	3,000a	736
1604	American Malting Co.	Chicago	Ill.	60	737
1636	Keystone Fibre Co.	Chester	Penn.		870

a Indicates anthracite coal. b Indicates bituminous. [1] Per day.

Supplemental Notes

Under this heading additional or supplemental information regarding old contracts appears, together with the page number of the original notice.

1547—Fremont, Ohio—Only one bid was received on this contract (p. 617), which provides for furnishing the Public Service Department with various grades of bituminous coal in carload lots during the ensuing year. This bid was irregular and could not be considered. Nothing further has been done concerning the contract. Address Clk. Ralph R. Williams, Dir. of Pub. Ser., Fremont, Ohio.

✚1619—Pleasantville, N. J.—Samples of coal have been ordered on this contract (pp. 787, 870), and the award will be made according to quality. The contract provides for furnishing the County Board with approximately 200 tons of Lehigh Valley pea and 150 tons of stove. Address Supt. T. L. McConnell, Pleasantville, N. J.

No. 1633—New York, N. Y.—Bids on this contract (p. 829) calling for 7,995 gross tons of anthracite coal and 1,590 gross tons of mine-run coal for six city departments were opened in Room 1230 Municipal Building on Nov. 22. There were 25 points of delivery as follows:

	Zone 1[1]	Zone 2		Zone 7[2]	Zone 8[3]	Zone 9[4]	Zone 11[6]

New Business

1653—East St. Louis, Ill.—The Granby Smelting and Mining Co. at this place will soon call for bids on their annual contract involving approximately 200 tons of 1½-in. screenings per week, and 700 tons of 2-in. or 3-in. nut coal. The screenings are for use in boilers and the nut coal for gas producers. Address Supt. Ross Boles, Granby Smelting and Mining Co., East St. Louis, Ill.

1654—Chester, Penn.—The Chester Tube Co., at this place usually contract for their annual fuel requirements about Jan. 1. Deliveries are made by Philadelphia & Reading Ry. Address Pur. Agt., F. W. Cook, Chester Tube Co., Chester, Penn.

1655—Chester, Penn.—The Chester Brewing Co., at this place usually contract for their annual fuel requirements involving about 600 tons on Jan. 1. Address Purchasing Agent, Chester Brewing Co., Chester, Penn.

1656—Clifton Heights, Penn.—The Caledonia Woolen Mills at this place usually contracts for their annual fuel requirements about Jan. 1. Address Purchasing Agent, Caledonia Woolen Mills, Clifton Heights, Penn.

1657—Chicago, Ill.—The Sefton Manufacturing Co. at this place will soon be in the market for their annual fuel requirements involving approximately 4,000 tons. The company uses either Franklin County or Carterville 2-in. screenings and the contract will cover the period ending Nov. 1, 1916. Deliveries will be in approximately equal monthly proportions. Address Pur. Agt. R. H. Clenny, Sefton Manufacturing Co., 1301 W. 35th St., Chicago, Ill.

1658—Camden, N. J.—J. Eavenson & Son, Incorporated, usually contracts for its annual fuel requirements, involving approximately 4,000 tons, the last of the year. Address Pur. Agt. Roland M. Eavenson, J. Eavenson & Son, Inc., Camden, N. J.

1659—Eddystone, Penn.—The Tindell-Morris Co., usually contract for their annual fuel requirements about Jan. 1. Deliveries are made by Pennsylvania R.R. Address Purchasing Agent Christen Tindell-Morris Co., Eddystone, Penn.

1660—East St. Louis, Ill.—The Obear-Nester Glass Co. at this place is testing out No. 2 screened nut coal from various mines preparatory to placing the contract for their power plant, involving about 120 tons per week, for the coming year. The contract for furnishing the company's gas producer with about 325 tons of 3x2-in. nut coal per week, was recently awarded to the Wickham Coal Co. Address Supt. Jos. Nester, Obear-Nester Glass Co., East St. Louis, Ill.

1661—Norristown, Penn.—The Adam Scheidt Brewing Co. usually contract for their annual fuel requirements about Jan. 1. Deliveries are made by Philadelphia & Reading Ry. Address Purchasing Agent., Adam Scheidt Brewing Co., Norristown, Penn.

1662—Wapakoneta, Ohio—The Wapakoneta Electric Light and Water Works at this place will be in the market Jan. 1 for their annual requirements of coal involving approximately 4,000 tons of mine-run Houston Thacker coal. The approximate cost is about $2.35 per ton delivered in the shed and the business is done on competitive bids. Address Supt. Harry Nagel, Wapakoneta Electric Light and Water Works, Wapakoneta, Ohio.

1663—Buena Vista, Colo.—The State Board of Corrections of this place will receive bids until 9 a.m., Dec. 13, for furnishing approximately 300 tons of mine-run steam coal for the Colorado State Reformatory. Address Pres. E. B. Wicks, State Bd. of Correction, Buena Vista, Colo.

1664—Atlantic City, N. J.—The Hotel Dennis at this place will be in the market on Jan. 1 for their annual fuel requirements involving about 4,000 tons of anthracite buckwheat coal. Address Purchasing Agent, Hotel Dennis Co., Atlantic City, N. J.

1665—Sioux Falls, Iowa—The Cudahy Packing Co. are considering covering their requirements until Apr. 1 of next year with a contract. About 100 tons of Carterville or Franklin County 2-in. screenings per day will be required. Address Pur. Agt. P. A. Moody, Cudahy Packing Co., Chicago, Ill.

1666—West Chester, Penn.—The Sharpless Separator Co. at this place usually contract for their annual fuel requirements, involving approximately 2,500 tons of anthracite buckwheat and pea coal, about the first of the year. Address Purchasing Agent Sharpless Separator Co., West Chester, Penn.

1667—Ironton, Ohio—The Director of Public Service will receive bids until noon, Nov. 30, for furnishing and delivering coal to the local pumping station as may be required during the year beginning Dec. 1. Bids must be accompanied by a certified check for $100. Address Clk., F. A. Ross, Bd. of Pub. Ser., Ironton, Ohio.

1668—St. Louis, Mo.—The St. Louis Car Co., at this place, is now conducting tests on No. 2 nut coal (unwashed), preparatory to placing a contract for their annual requirements, involving approximately 125 tons weekly. The coal is for use at the company's power house. Address Pur. Agt. E. B. Meissner, St. Louis Car Co., St. Louis, Mo.

1669—Sioux Falls, S. D.—It is understood that the South Dakota Ry. Co. will soon place a contract involving approximately 1,000 tons per month of southern Illinois 6x1½-in. egg coal, for delivery up to Mar. 31 of next year. Address H. S. Stebbens, South Dakota Central Ry. Co., Sioux Falls, S. D.

1670—Ft. Wayne, Ind.—The Evans Coal Co. at this place is in market for a prompt tonnage of West Virginia nut and slack coal for delivery up to Jan. 1. Address The Evans Coal Co., Ft. Wayne, Ind.

1671—Grand Haven, Mich.—The Eagle-Ottawa Leather Co. at this place is receiving bids for their annual coal requirements, involving approximately 100 tons of West Virginia mine-run coal. Deliveries are to be completed during next year, and will be required at the rate of about two cars per week. Address Gen. Mgr. Wm. Hatton, The Eagle-Ottawa Leather Co., Grand Haven, Mich.

1672—Madison, Ill.—The Barber Asphalt Paving Co. of this place will contract about Dec. 1 for a supply of lump and screenings to last them until Apr. 1 of next year. About 30 tons per day will be required, and bidders must be prepared to state if they will be able to supply the company's requirements when the prospective shut down appears next spring. Quotations should be f.o.b. terminal tracks at the Madison City plant of the company. For notice of previous purchase of this company, see contract 494, Vol. 7, p. 665. Address Pur. Agt. White, Barber Asphalt Paving Co., Madison, Ill.

+1673—Muncie, Ind.—The City Government at this place is receiving bids on from 600 to 700 tons of West Virginia three-quarters lump coal for use at the local garbage plant. The contract will probably be let to one of the local dealers. Address City Clerk, Muncie, Ind.

+1674—Erie, Penn.—The City Government at this place will advertise for bids about Dec. 15 to supply the local garbage plant during the next year. For notice concerning the announcement of the bids on the current contract see contract No. 61, Vol. 7, p. 189. Address Supt. Frank E. Pelow, Dept. of Parks and Pub. Property, Erie, Penn.

+1675—Winnipeg, Manitoba, Can.—Bids will be received during the early part of next year for furnishing the greater Winnipeg Water District with steam coal during the ensuing 12 months. From 3,000 to 5,000 tons of lump coal having a heat value of not less than 13,000 B.t.u., will be required. Deliveries are to be as ordered f.o.b. Paddington Transfer, St. Boniface. For previous notice concerning the current contract, see contract No. 82, Vol. 7, p. 375. Address Chn. S. H. Reynolds, 901 Boyd Bldg., Winnipeg, Manitoba, Can.

1676—Peru, Ind.—The contract for furnishing the Miami County Bldg. at this place with approximately 600 tons of coal will be let about Dec. 1. The business is usually let to one of the local dealers. Address City Clerk, Peru, Ind.

1677—Chicago, Ill.—Sealed proposals will be received until 11 a.m., Nov. 29, for furnishing and delivering coal for the following departments in various sections of the city. Each division, as listed in the following, is a separate contract, and the deposit required to accompany each bid is given:

	Department			
	Fire	Health	Street	Police
District No. 1	$500	$100	$100	$100
District No. 2	500	100	100	100
District No. 3	600	200	100	100
District No. 4	800	100	100	100
District No. 5	500	...	100	100

PUMPING STATIONS

Central Park Ave.	$2,200	Chicago Ave.	$2,000
Sewage pumping stations	100	Twenty-second St.	1,900
Harrison St.	700	Sixty-eighth St.	2,200
Springfield Ave.	2,000	Rogers Park	200
Lake View	2,200	Roseland	1,200
Fourteenth St.	2,200		

MISCELLANEOUS

City Hall Building	$900
Bureau of Engineering	100
Bridges and Harbors	200
Naphtha Storage Tanks	125

For previous bids and awards on this contract see Vol. 7, pp. 488, 666, 748.

Address Comr. of Pub. Wks. L. E. McGann, Room 406, City Hall, Chicago, Ill.

1678—Philadelphia, Penn.—The Hahnemann Hospital at this place consume approximately 3,000 tons of buckwheat coal per annum, for which they usually contract about Jan. 1. Address Secretary, Hahnemann Hospital, Broad and Race St., Philadelphia, Penn.

1679—New York, N. Y.—The Dept. of Public Works will receive bids until 2 p.m., Dec. 3, for furnishing, delivering, storing and trimming coal for use of the various public buildings, courts, etc., in the Borough of Manhattan, as follows: 3,000,000 lb. buckwheat No. 1; 20,000,000 lb. buckwheat No. 2; 2,000,000 lb. of buckwheat No. 3; 1,200,000 lb. of broken coal; 3,500,000 lb. of bituminous mine-run. Deliveries are to be completed by June 30, 1916, and the successful bidder will be required to furnish a bond for $15,000. For announcement of bids on the current contract see contract 19, Vol. 6, p. 892. Address Pres. Marcus M. Marks, Room 2032, 20th floor, Municipal Bldg., New York, N. Y.

1680—Philadelphia, Penn.—Geo. P. Pilling & Son, manufacturers of surgical instruments, at this place, usually contract for their annual fuel requirements, involving approximately 2,500 tons of white ash buckwheat coal, about Jan. 1 of each year. Address Purchasing Agent George P. Pilling & Son, 23rd and Arch St., Philadelphia, Penn.

1681—Philadelphia, Penn.—The Spreckels Sugar Refining Co. at this place usually contract for their annual fuel requirements, involving approximately 20,000 tons of buckwheat coal, about Jan. 1. Address Treasurer, Spreckels Sugar Refining Co., Foot of Reed St., Philadelphia, Penn.

+1682—Crosby, N. D.—The Divide County Commissioners will receive bids until 2 p.m., Nov. 29, for furnishing coal as may be required at the court house, jail and sheriff's office during the year beginning Jan. 1. No. 1 screened lump lignite is required. All bids must be accompanied by certified check for $50. Address County Audr. W. E. Vadnais, Crosby, N. D.

1683—Bozeman, Mont.—The Gallatin County Board of Commissioners will receive bids until 2 p.m., Dec. 8, for furnishing approximately 100 tons of good lump coal to the local court house and jail, and coal as may be required by the county poor. Address Clk. E. H. Schumacher, Gallatin County, Bozeman, Mont.

1684—Salt Lake City, Utah—The Board of Education at this place received bids until noon Nov. 19 for furnishing approximately 5,000 tons of slack and 500 tons of lump and nut coal to be delivered in the bins of the various school buildings as may be required during the school year ending June 30, 1916. For a previous notice regarding this contract see p. 114. Address Clk. L. P. Judd, Bd. of Edu., Room 202 City and County Building, Salt Lake City, Utah.

Contracts Awarded

Note—Successful bidders are noted in **bold face** type.

+1323—New York, N. Y.—This contract (p. 367), which provides for furnishing and trimming between 9,000 and 25,000 tons of coal into dredges during the period ending Sept. 30, 1916, has been awarded to the **Commercial Coal Co.**, the gross consideration being $57,630. Address U. S. Engineers' Office, Room 707, Army Bldg., 39 Whitehall St., New York City.

+1404—New Orleans, La.—This contract (pp. 408, 576), which provides for furnishing the New Orleans Cotton Exchange with its winter supply of coal, has been awarded to the **Tennessee Coal and Iron Co.** on Pratt coal. Address Pur. Agt. Plauche, New Orleans Cotton Exchange, New Orleans, La.

+1438—New Orleans, La.—This contract (pp. 490, 660), which provides for furnishing the Interstate Bank and Trust Co. with its annual fuel requirements, involving about 200 tons of coal, has been awarded to the **C. A. Andrews Coal Co.** at $3.30 per ton. The new price represents an increase of 15c. per ton over the old contract. Address Pur. Agt. J. W. Billingsley, Interstate Bank and Trust Co., New Orleans, La.

1470—Minnewaukan, N. D.—This contract (p. 531), which provides for furnishing and delivering about 150 tons of lignite coal to the County Court House, has been awarded to the **Andrews Grain Co.** at $2.15 per ton for the best grade screened lignite. Address Aud. W. E. Paulson, Benson County, Minnewaukan, N. D.

1504—New Orleans, La.—This contract (p. 577), which provides for furnishing the Swiss Steam Laundry at this place with approximately 200 tons of steam coal, has been awarded to the **C. A. Andrews Coal Co.** Address Pur. Agt. L. P. Hakenjose, Swiss Steam Laundry, 1010 Gravier St., New Orleans, La.

COAL AGE

Vol. 8 NEW YORK, DECEMBER 4, 1915 No. 23

The Important Question

Written Expressly for COAL AGE

By Berton Braley

ANOTHER year's swiftly approaching its close
And Christmas time comes as the fleeting year goes;
The children come home for the annual spread
And spirits are gladdened and bodies are fed.
No matter if purses aren't fearfully fat,
Don't mutter and grumble and kick about that,
Be merry—but question yourselves now and then:
"*What kind of a Christmas is this for* MY MEN?"

You've plenty to eat and you've plenty to wear,
You've comfort and warmth and a little to spare,
But how about those who have labored for you,
Who've toiled in the workings the weary year through?
Are they spending Christmas in cottages neat
Or huddled in hovels disgracing the street?
Is the town like a town—or a grimy-walled pen?
"*What kind of a Christmas is this for* Your Men?"

Has Christmas brought some of them hunger and want?
Is poverty stalking them, ugly and gaunt?
It isn't your fault? Well, perhaps it is not,
And it may not be theirs; can't you brighten their lot?
Won't you see that at least for one day in the year
Their homes and their hearts shall be brimming with cheer?
It isn't a matter of how things have been
But—"*What sort of Christmas is this for* YOUR MEN?"

We're wishing you joy and prosperity, too,
May all sorts of fortune come rolling to you;
But mingled with all of your luck we shall trust
That providence teaches you how to be just—
Yes, just to yourselves and to workers whose lives
Are spent in their labor for children and wives,
Be just—and this question won't worry you then,
"*What kind of a Christmas is this for* YOUR MEN?"

Ideas and Suggestions

Benefits of Prohibition

By George N. Lantz*

In the efforts made to promote temperance or to bring about prohibition greater stress is laid on the economic loss to the drinking class than formerly.

In the recent unsuccessful attempt to prohibit the sale of liquor in Ohio efforts were made to show that the taxes, license fees, and expenses of all sorts of the breweries and saloons were paid by the men who drink and that the consumer pays the bills. The "drys" also endeavored to show the results that would accrue from a proper expenditure of the money spent on drink. Similarly in "Pages from a Miner's Notebook" (*Coal Age*, Vol. 8, p. 756) the writer treats of the saloon evil from the standpoint of dollars and cents. After Jim Bates, the regular customer of the saloon keeper, was incapacitated for his employment he discovered that he had no funds to tide him over his difficulties and became a charge for his more thrifty neighbors.

The writer might have gone farther and related a common occurrence in many mining communities, or in fact in any labor center, for the saloon evil affects other kinds of labor than mining.

During times of temporary idleness, strikes, wage adjustments and dull business, the intemperate class regardless of their physical fitness for work often become a burden for the more thrifty element, who as a rule look after the unfortunate families of the drinking element by making donations of food, clothing, fuel and sometimes money.

Another Use for Liquor Money

As to what might be accomplished by another use of the money that finds its way across the bar let me set down the views of a certain railway employee speaking of a mining village of about 2,000 population—a village with which I am familiar.

Said this railway man, "I've been on this run for 20 years, and in that time there has never been a Monday morning when the brewers' agent of this town has sent less than $2,000 to the breweries and at times it reached $4,000. This represents the brewers' share of the profit of the saloon. If the people of the town were wise, they'd keep that money at home and every week someone could put up a $3,000 home."

We will be more conservative than the railway employee and say $2,500 homes. Also we will say that only one-half is spent by residents of the town, the other half coming from the surrounding neighborhoods and from transients, and we will build a home every two weeks instead of every week. Then on the supposition that there are 325 families in the village, we find that in a little over thirteen years every family could be living in a home valued at $2,500 or have that amount in the bank.

It is certainly a more agreeable picture to contemplate a village of 325 homes, none of them costing less than $2,500, than the large number of poorly kept, unpainted shacks that are seen there today.

I have intentionally confined my remarks to the money side of the liquor question in this letter, though much can be said from the standpoint of morality, hygiene, safety, etc.

⁂

How Efficient Is Your Patch?

By N. G. Near

Mentally, we are all imperfect. We must admit it. We are continually saying to ourselves, "If I only knew how to do such and such a thing, I would be all right."

Sometimes we make a half-hearted effort to learn how to do that thing. Sometimes we make a really earnest effort, and as a result we actually learn how the thing is done.

This is equivalent to "putting a patch on our brain," and the thoroughness with which we learn determines the efficiency of the patch. A patch on a boiler that decreases steam leakage 10 per cent. is better than no patch at all, but it is far from perfect. Nor is a patch perfect that permits 1-per cent. leakage. That is why we always aim to make patches on steam pipes and boilers 100 per cent. efficient.

Applying this logic to ourselves, why are we so often satisfied with a 50-per cent. patch on the brain? Why 90 per cent.? Should we ever fall short of 100 per cent.?

"Well," you may say, "there should be no patching to do. We should learn one thing after the other in logical sequence."

That sounds very fine, but it is almost impossible to learn methodically. As we continue to live we learn by "jumps," and we therefore leave behind us many little "gaps" in our education that should not exist. These are the gaps that need patching. When patching time comes, therefore, let us do the job right.

⁂

Pivotal Position in a Coal Mine

By Forney L. Parker*

In a coal mine the boss who comes in closest contact with the miner is the assistant foreman, and on whether he is efficient in his daily duties of handling the men depends in a large measure the success of the mine organization.

He must be thoroughly conscientious and faithful in the performance of his duties, and to do this he must have a definite idea of every man's work and his daily progress. This requires not only the necessary daily examination of the working faces before the miners arrive for their day's shift, but also the essential visit while the men are at work. It is during this second visit that the miner should be instructed to do the necessary work in the proper manner, and if the employee does not follow the instruction of his superior officer he should be disciplined accordingly.

---

*New Straitsville, Ohio.

*Joliet, Penn.

The obedience of the men must be gained by kindness and getting their confidence rather than by inspiring fear in them. When the employee disobeys he should be punished, and at the time the penalty is imposed be sure that he knows just what he is being punished for.

There Should Be a Fixed Standard

There should be a standard for the various "stunts" performed in the mining and transportation of coal, and the assistant must see that they are done accordingly and are accomplished in a standard time.

When a new man is employed he should be instructed to perform his duties in the easiest, safest and quickest way, and not be allowed to pick up the wrong methods as practiced by the man who held the job before him or by his present "buddy."

Let your men work out the minor details of the job in their own way, for by giving them responsibility you get better results than you do by constant supervision.

All of the assistants at a mine should pull together, and they should try to improve the spirit and ideals of the mine worker. The mine foreman cannot watch the different sections of the mine as closely as his assistants, and both must depend largely upon the honor of the employee for the fullest performance of work.

In issuing an order or proposing new work the safety of the miner is of first consideration, and if the policies which are here set forth are carried out, it will eventually lead to the greater efficiency and safety of the miner and result in winning the maximum quantity of coal from the mine.

The Boiled-Shirt Job

The reason for the preponderance of foreign population about the coal mines today is the unwillingness of Americans to do the rough work connected with the mining industry. The skilled miner of yesterday sent his son to school, and college if possible, to the end that he might have an easy life—that he might land a "boiled-shirt job."

The young American coal miner is rare today. The place vacated by him in the mines has been taken by the foreigner. And now the immigrants' sons are in turn looking for a job that will enable them to be dressed up all of the time.

It is the old failing of false pride—the belief that there is something demeaning in manual labor. The old saying that "clothes do not make the man" is mighty true when applied to the men of the coal-mining industry. Many a young fellow is working for a starvation salary in an office when he could be earning twice as much in the mine. And the mines need these young men. Without them our miner of tomorrow will again be the ignorant immigrant from foreign shores with his constant need of supervision.

Back-to-the-Mines Movement Is Needed

We have recently had a back-to-the-farm movement sweeping the country. What the mining industry needs is a back-to-the-mines movement for these young fellows who could become skilled miners. There is not room for all at the top, and whether being at the top is wearing a white collar or digging coal in the mines is only a matter of personal opinion.

There is a real opportunity for every young man in the mine. The professions are crowded; superintendents, engineers and clerks are plentiful. Only a few are rising, while many are standing still, and very seldom is the compensation commensurate with the work and responsibility assumed.

On the other hand the skilled miner is in demand. While he has not received much recognition in the past, a better time is coming for him. As our method of mining in the future will be one of concentration, the skilled miner will be singled out from the riffraff that fill our mines today.

There are respect, good wages and plenty of work for the skilled coal miner of tomorrow, while the hazards of his work will be reduced to a minimum.

An Interesting Letter

The following letter will appeal to many coal-mine managers as representative of conditions at their own plants. The general sense of the letter might be absorbed to advantage by the under officials at many mines. The letterhead and names in the letter have been changed to disguise its origin.

NORTH AMERICAN COAL AND COKE CO.
Operating Department

Chicago, Ill., Nov. 13, 1915.

Mr. Henry Porter, Supt.,
Carbon City Mines.

Dear Sir: Immediately on receipt of your letter of Nov. 6, I wrote a circular letter to all of the other superintendents of the company asking them if they had in their employ an assistant electrician competent to take charge of the electrical work at your plant. All the replies received were very similar—they had men who had had sufficient experience, but they hesitated to recommend them because they did not know whether they would make good as bosses.

For a long time I have had in mind the advisability of writing a circular letter to all of our superintendents bearing on the very point raised by these letters, and now that the superintendents themselves to a man have pulled down the bars, I will no longer hesitate—I'll make a circular letter of this.

As I see it, gentlemen, the highest service that a superintendent can render his company is manifested when he develops a system that obtains from each employee the best that he is capable of. When a superintendent has in mind such a purpose it seems to me that he must always have more electricians and boss drivers and firebosses and weighmen waiting for a chance than the company could use in a hundred years.

Everyone realizes that the world is full of square pegs in round holes, but how many are competent to change these misfits around? I'll answer my own question by saying, Master pilots only, and I'll go a little further while my courage is up and remark that the "Big Boss," as you call him, seems to be the only one who can measure up to the test, and he'll prove it by calling attention to the fact that every one of his superintendents privileged to read this came up from his ranks. Why?

Some of you were engineers, some were mine foremen and still others chief clerks, but I thought I saw higher talent in each one, and you haven't disappointed me very much. Now sit you down, every last one of you, while your dander is up and write me a frank letter telling me just how I have misjudged you, and as a sort of postscript put down the names of some fellows you have your eyes on right now.

It's a pleasure to help others, especially when the others are a bit appreciative; please don't forget that, and also don't forget that I still have my eyes on every one of you—perhaps I need an understudy. Yours very truly,

CARLETON E. DAVIS,
General Manager.

Mine-Hoist Calculations

By F. L. Stone*

SYNOPSIS—The first of a series of articles bearing on this subject. The case of an unbalanced slope hoist is considered, each successive step in the calculations being exemplified.

The object of this and succeeding articles is to set before the mine operator a clear and concise method for the solution of the majority of hoisting problems. Various conditions of hoisting will be considered and the same method of solution applied. The only knowledge required to intelligently follow the various steps is a clear understanding of the fundamental laws governing mechanics and motion.

There are numerous methods used by engineers for calculating hoist cycles, but the moment method, while perhaps a little longer than some others, is almost universal in its application and the simplest arithmetic is employed in the final solution. This method will be used throughout.

GENERAL VIEW OF 700-HP. HOIST AT CROWS NEST MINE OF KEYSTONE COAL AND COKE CO.

The following cases will be considered and solutions worked out in detail.

1. Slope haulage, unbalanced.
2. Slope haulage, balanced.
3. Shallow shaft, balanced.
4. Shallow shaft, unbalanced.
5. Shallow shaft, unbalanced, with counterweight.
6. Deep shaft, balanced.
7. Conical drums.
8. Odd-shaped drums.

For the sake of simplicity each case will be illustrated by an example worked out in detail, the examples being selected from actual mining conditions.

CASE 1. UNBALANCED SLOPE

Length, feet	2,000
Tonnage in 8 hr.	2,800
Percentage of grade	6
Cars per trip	40
Rest at top, minutes	3
Rest inside, minutes	3
Weight of coal per car, tons	2
Weight of car, tons	1½

To assure tonnage, calculations are based on securing the entire output of the mine in 7 hr.

$$\text{Trips per hour} = \frac{2{,}800}{2 \times 40 \times 7} = 5.$$

$$\text{Time of round trip} = \frac{3{,}600}{5} = 720 \text{ sec.}$$

Total rest top and bottom per trip = 360 sec.

Running time up and down = 720 — 360 = 360 sec.

$$\text{Running time one way} = \frac{360}{2} = 180 \text{ sec.}$$

If the speed were constant throughout the running, the velocity in feet per second would be $\frac{2,000}{180}$, but during acceleration and retardation the average velocity is only one-half the running velocity because the load starts at zero speed and ends at V speed during acceleration, and during retardation it starts at V and ends at O.

---

*Power and mining engineering department, General Electric Co., Schenectady, N. Y.

Let

D = Total distance traveled;
V = Running velocity;
t_a = Time of acceleration;
t_r = Time of retardation;
T = Total running time of trip.

Then the space passed over during acceleration $= \frac{Vt_a}{2}$ and during retardation $= \frac{Vt_r}{2}$ and the distance passed over at full speed $= D - \frac{Vt_a + Vt_r}{2}$.

The time of full speed running $= T - (t_a + t_r)$.

$$V = \frac{D - \frac{(Vt_a + Vt_r)}{2}}{T - (t_a + t_r)}$$

$$V(T - (t_a + t_r)) = D - V\frac{(t_a + t_r)}{2}$$

$$V(T - (t_a + t_r)) + \frac{(t_a + t_r)}{2} = D \qquad V = \frac{D}{T - \frac{t_a + t_r}{2}}$$

Assume that t_a = 20 sec. and t_r = 10 sec. Then

$$V = \frac{2,000}{180 - 15} = 12.1 \text{ ft. per sec.}$$

Such a load as described would require a rope 1⅜ in. in diameter, and this size of rope should not be coiled on a drum of a diameter less than 7 ft., which gives a ratio of rope diameter to drum diameter of slightly over 1:60. If the drum is 7 ft. in diameter, each convolution will contain approximately 22 ft., and there will be about 91 turns in all. This would be wound in two layers. To be absolutely accurate the change in diameter due to the second layer being wound on top of the first should be taken into account. This is of such small importance that it will not be considered in the present problem. All calculations will be made on the basis of a constant drum diameter of 7 ft. The drum will therefore make $\frac{2,000}{7 \times \pi}$ turns = 91.

MOMENT VALUES SHOULD BE PLOTTED

It will be well to plot the values of the individual moments on a cross-section sheet as soon as calculated, using the vertical scale for moments and the horizontal scale for turns.

It must be borne in mind that percentage of grade as given in coal-mine work is in reality the sine of the angle which the slope makes with the horizontal, and the rope pull due to the weight alone is W times this sine.

Weight of up-load = (4,000 + 3,000) 40 = 280,000 lb.

Effective weight (or rope pull) = 280,000 × 0.06 = 16,800 lb.

Moment at zero turns (start) = 16,800 × 3.5 = 58,750.

Moment at 91 turns (finish) = 16,800 × 3.5 = 58,750.

Rope of 1⅜ in. in diameter weighs 3 lb. per ft.
Effective weight = 3 × 2,000 × 0.06 = 360 lb.
Moment at zero turns = 360 × 3.5 = 1,260.
Moment at 91 turns = 0.
Rolling friction = 35 lb. per ton.

If the angle the slope makes with the horizontal is greater than 8° (14%), then the effective weight on the track will be found by multiplying the weight by the cosine of the slope angle. If, however, as in the case under consideration, the angle is less than 8° the cosine is so close to unity it may be considered as such and the entire weight assumed as being normal to the track.

$$\frac{280,000}{2,000} = 140 \text{ tons}$$

140 × 35 = 4,900 lb. rolling friction.

Moment due to rolling friction:
Zero turns = 4,900 × 3.5 = 17,150.
At 91 turns = 4,900 × 3.5 = 17,150.

Rope friction is one of the most variable quantities to be contended with in slope haulages. The conditions of the rollers and their spacing play an important part. However, experience has shown that 200 lb. per ton of normal pressure seems a safe figure. The remarks in regard to the pitch of the slope and the cosine of its angle apply to the rope as well as to the load. Therefore

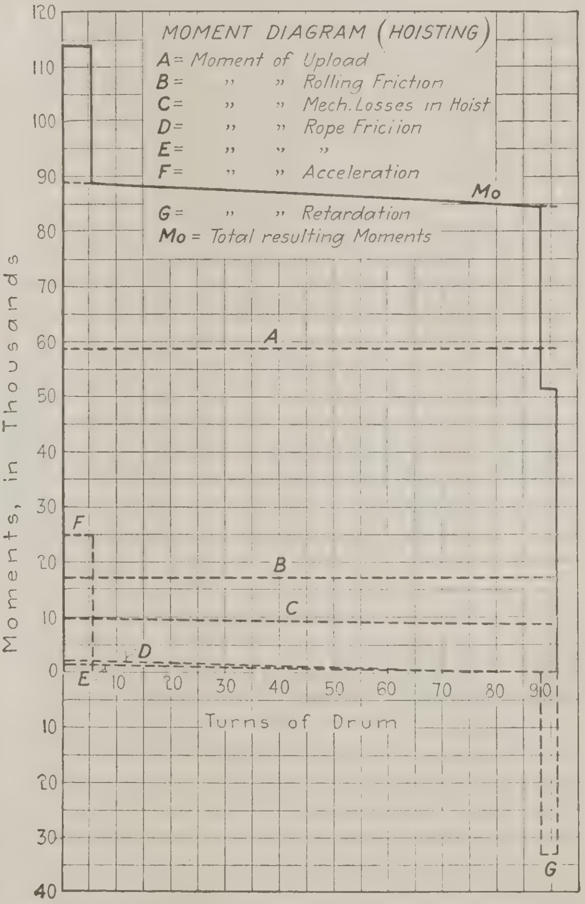

DIAGRAM OF MOMENTS DURING HOISTING

$$\frac{2,000 \text{ ft.} \times 3}{2,000} = 3 \text{ tons}$$

3 × 200 = 600 lb. rope friction at start.

Moment of rope friction:
Zero turns = 600 × 3.5 = 2,100.
At 91 turns = 0 × 3.5 = 0.

SUMMATION OF MOMENTS

	Turns 0	Turns 91
Up-load	58,750	58,750
Rope	1,260	0
Rolling friction	17,150	17,150
Rope friction	2,100	0
Total moments	79,260	75,900

The assumption of the proper percentage to be used for the losses in the hoist itself is a subject on which few or no reliable data can be found. The question becomes more complicated in the case of balanced hoists where the ratio between the total mass moved in the shaft or slope and the mass of coal or ore hoisted is much greater than in unbalanced haulages such as the one being considered. It is obviously incorrect to assume a percentage of the net moments without regard to total weight on the drums. Such assumptions can easily be reduced to an absurdity by considering a balanced shaft with both cages loaded. The net moment is zero and any percentage of this value would be zero.

In the case under consideration, however, it will be safe to assume 80 per cent. as the efficiency of the hoist proper from motor shaft to rope. Other cases will be discussed later.

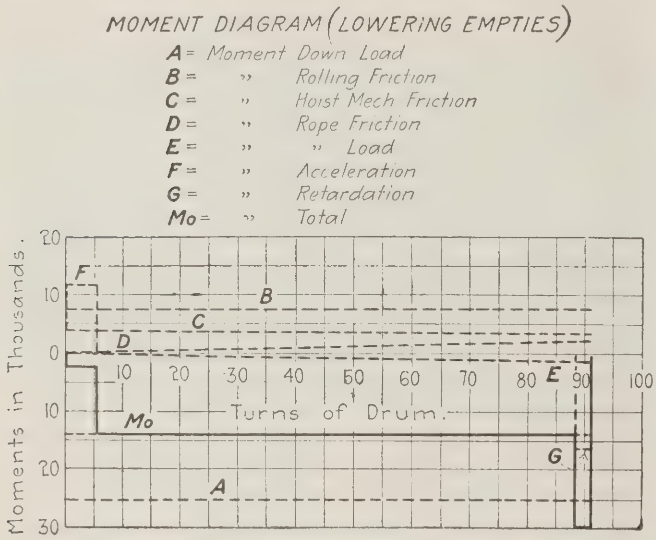

DIAGRAM OF MOMENTS WHILE LOWERING EMPTIES

Friction moment at zero turns:

$$\frac{79,260}{0.80} - 79,260 = 9,740$$

At 91 turns the moment is

$$\frac{75,900}{0.80} - 75,900 = 8,700$$

Total net moments exclusive of acceleration and retardation:

	Turns 0	Turns 91
Total, less friction	79,260	75,900
Mechanical friction	9,740	8,700
	89,000	84,600

The problem is now completed with the exception of determining the moment due to accelerating and retarding the entire mass. For easy reference the following fundamental equations applying to mass and motion are recorded:

$$M = \frac{w}{g} \qquad (1)$$

$$v = a \times t, \text{ or } a = \frac{v}{t} \qquad (2)$$

$$S = \frac{v \times t}{2} \text{ or } \frac{a \times t^2}{2} \text{ or } \frac{v^2}{2a} \qquad (3)$$

$$F = ma = \frac{wa}{g} \qquad (4)$$

$$\text{Stored energy} = \frac{mv^2}{2} \qquad (5)$$

Where

M = Mass;

w = Weight in lb.;

a = Rate of acceleration in ft. per sec. per sec.;

g = 32.2 (acceleration in ft. per sec. per sec., due to gravity);

S = Distance or space passed over during acceleration or retardation;

v = Velocity in ft. per sec.;

t = Time in seconds during which v is changing;

F = Force in lb.

In the case under consideration the mass to be accelerated from rest to running speed (v) consists of the coal, cars, rope, drums, track rollers, etc. This is summed up as follows: Up-load, 280,000 lb.; rope, 6,000 lb. wound on drum; rope, 500 lb. holding turns and rope between drum and end of trip; total, 286,500 lb.

If acceleration is to be accomplished in 20 sec.;

$$v = 12.1 \qquad t_a = 20 \qquad a = \frac{12.1}{20} = 0.605$$

$$F = \frac{286,500 \times 0.605}{32.2} = 5,400$$

$$\text{Moment} = 5,400 \times 3.5 = 18,900 \qquad \frac{18,900}{0.80} = 23,600$$

Hoist Proper

The drum is 7x6 ft. and should weigh with gears, etc., approximately 40,000 lb. The radius of gyration will be about 75 per cent. of the drum radius, or 2.62 ft.

Therefore, the WR^2 of the hoist proper will be 40,000 $\times$ 2.62^2 = 275,000.

In order to simplify matters find the effective weight of the drum if it were concentrated at the drum radius; that is, 3.5 ft.

$$WR^2 = 275,000 \quad R = 3.5 \text{ ft.} \quad W = \frac{275,000}{3.5^2} = 22,500.$$

This weight may be considered as traveling at rope speed—that is, 12.1 ft. per sec.—and could have been added directly to the weight of trip and rope.

$$v = 12.1 \qquad a = 0.605 \qquad F = \frac{22,500}{32.2} \times 0.605 = 425$$

The acceleration moment = 425 × 3.5 = 1,480.
Acceleration of material in slope = 23,600.
Total acceleration = 25,080.

During Retardation Energy Is Released

During retardation the energy stored in the moving system has to be given up. In some systems of drive it is partly restored to the line and partly used in lifting the load through the remaining distance of travel. For instance, if a system weighing 100,000 lb. is moving at the rate of 10 ft. per sec., it has stored in it $\frac{100,000 \times 10^2}{32.2}$ = 310,000 ft.-lb., or $\frac{310,000}{550}$ = 564 hp.-sec., which may be dissipated at the rate of 564 hp. for 1 sec., or 56.4 hp. for 10 sec. or at any other rate. It is evident that since during the retardation power is released by the moving parts this power must be given an algebraic sign opposite to the sign used when power is absorbed by the hoist.

Since the retardation is accomplished in one-half the time of acceleration—that is, 10 sec.—the value a will be twice what it was during acceleration. Other values will remain the same. It is therefore possible for the sake of brevity to multiply the acceleration moments by the inverse ratio of the times. Thus

Moment of retardation of up-load

$$\frac{18{,}900 \times 20}{10} = -37{,}800$$

Amount getting back to motor shaft $= -37{,}800 \times 0.80 = -30{,}240$.

Moment of retardation of the drums $=$

$$\frac{1{,}480 \times 20}{10} = -2{,}960$$

$$\text{Total,} \quad -33{,}200$$

Note that in the acceleration and retardation of the drums proper no efficiency has been included. The reason for the omission is that while energy is being stored or given up by the drums there is little or no loss due to this alone. There would be no additional rope stress which in turn produces additional bearing loss. If the hoist is geared, there is added gear loss, but the amount should be small. Since the losses in the hoist proper are taken care of as a percentage of the running horsepower and the horsepower due to the acceleration of the load, it has been decided to omit any correction for loss due to the acceleration or retardation of the drums.

Turns of drum during acceleration and retardation must be calculated so that the moment values may be plotted.

This may be found in a number of ways, but the simplest seems to be the following:

Total turns $= 91$.

Total time $= 180$ sec.

$$t_a = 20 \qquad t_r = 10 \qquad \frac{t_a + t_r}{2} = 15$$

$$\text{Revolutions per second} = \frac{91}{180 - 15} = 0.55$$

Since the running velocity of the drum is 0.55, r.p.s., the number of turns during acceleration $=$

$$\frac{0.55 \times 20}{2} = 5.5$$

The number of turns during retardation $=$

$$\frac{0.55 \times 10}{2} = 2.75$$

TOTAL SUMMATION OF MOMENTS

	Turns					
	0	5.5	5.5	88.25	88.25	91
Up-load	89,000	88,800	88,800	84,700	84,700	84,600
Acceleration and retardation ...	25,080	25,080	0	0	—33,220	—33,220
	114,080	113,880	88,800	84,700	+51,480	+51,380

To convert the moments into horsepower it will be necessary to multiply the moment by the speed in feet per second and divide by 550.

$$\text{Hp.} = \frac{\text{Force} \times \text{Velocity (in ft. per sec.)}}{550}$$

$$= \frac{\text{Force} \times 2\pi R \times \text{r.p.s. (of drum)}}{550}$$

$$= \frac{\text{Force} \times R \times 2\pi \times \text{r.p.s.}}{550}$$

$$= \frac{M \times 2\pi\,\text{r.p.s}}{550}$$

where R = radius of drum in feet.

Turns	Moment	$\text{H.p.} = \frac{(2\pi \text{ M r.p.s.})}{550}$	Time
0	114,080	715	0
5.5	113,880	714	20
5.5	88,800	558	20
88.25	84,700	532	170
88.25	51,480	324	170
91	51,380	323	180

The horsepower value at zero turns is of course zero, since the speed is zero. The value given in the table is known as horsepower torque, or horsepower that would exist if the motor or load were up to speed. By glancing at the horsepower-time curve, it will be seen that the operator starts the trip and accelerates for 20 sec. with a motor output of 714½ hp. At the end of 20 sec. acceleration ceases and the horsepower drops to 558. This speed is held for 150 sec., the horsepower falling to 532, because the rope load and friction have been decreasing during the up-trip. At 170 sec. the retarding is begun, and the stored energy plus 324 hp. output from the motor, will be enough to bring the trip the rest of the way.

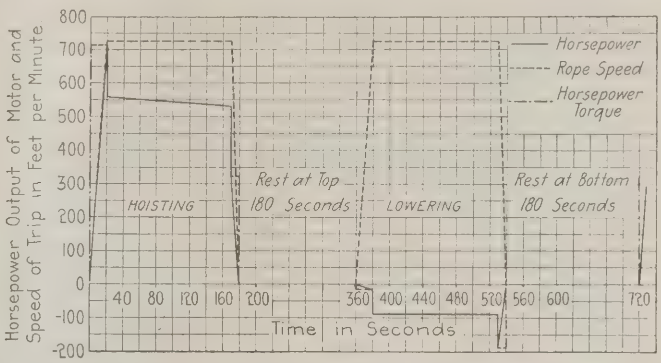

DIAGRAM OF HORSEPOWER, ROPE SPEED AND HORSEPOWER TORQUE

Lowering the Empty Trip

In the majority of slopes of this nature the lowering is accomplished by unclutching the drum and letting the motor stand idle. The energy given up by the descending trip is converted into rolling friction and friction on the brake of the hoist.

It is possible and entirely practical in case of induction motor-driven hoists to restore part at least of this energy to the line. This is accomplished by starting the motor with its trip in the lowering direction and as full speed is reached throwing the control handle into the full on position. The load will then overhaul the motor, tending to drive it above synchronism. The motor will then become a generator and return such energy to the line as is not absorbed by friction of moving parts. In bringing the trip to rest the controller is thrown to the off position and the brakes applied as usual.

It will be instructive to find how much energy the example given would return to the motor while lowering. It must be remembered that all friction values are positive, since they require power, and the energy given up by the trip will be negative.

Moment of trip:

Weight $= 3{,}000 \times 40 = 120{,}000$ lb.

Effective weight = 120,000 × 0.06 = 7,200 lb.

Moment at 0 turns = —7,200 × 3.5 = —25,200

Moment at 91 turns = —7,200 × 3.5 = —25,200.

Moment of rope:

Moment at 0 turns = 0.

Moment at 91 turns = —6,000 × 0.06 × 3.5 = —1,260.

Moment of rolling friction:

120,000 lb. = 60 tons.

60 × 35 = 2,100 lb.

Moment at 0 turns = 2,100 × 3.5 = 7,350

Moment at 91 turns = 2,100 × 3.5 = 7,350.

Rope Friction

The total weight of the rope = 6,000 lb. = 3 tons at 200 lb. friction per ton = 600 lb.

Moment at zero turns = 0.

Moment at 91 turns = 600 × 3.5 = 2,100.

SUMMATION OF MOMENTS LESS MECHANICAL FRICTION OF HOIST

	Turns	
	6	91
Down trip	—25,200	—25,200
Down rope	0	—1,260
Rolling friction	+ 7,350	+ 7,350
Rope friction	0	+ 2,100
	—17,850	—17,010

Assumed mechanical efficiency of hoist = 80 per cent.

At zero turns —17,850 × 0.8 = —11,000, or the frictional loss = 3,850.

At 91 turns —17,010 × 0.8 = —13,608 or frictional loss = 3,402.

Total net moments exclusive of acceleration and retardation:

	Turns	
	0	91
	—17,850	—17,010
Mechanical friction	+ 3,850	+ 3,402
Total	—14,000	—13,608

Acceleration and Retardation

The total moving parts have to be accelerated exactly the same as in the case of hoisting. Since it will require power to do this, the sign will be positive as before.

Weight of trip 120,000 lb.
Weight of rope 6,500 lb.
Total weight in slope 126,500 lb.

Acceleration in 20 sec. as before,

$$v = 12.1 \quad a' = 0.605 \quad F = \frac{126{,}500 \times 0.605}{32.2} = 2{,}375$$

Moment = 2,375 × 3.5 = 10,380

Weight of drum = 22,500 lb.

$$F' = \frac{22{,}500 \times 0.605}{32.2} = 422$$

Moment = 422 × 3.5 = 1,480

Total acceleration moment, 11,860

Retardation in 10 sec., as before,

Cars and rope weigh 126,500 lb.

$$a = \frac{12.1}{10} = 1.21 \quad F = \frac{-126{,}500 \times 1.21}{32.2} = -4{,}750$$

Moment = —4,750 × 3.5 × 0.8 = —13,296

$$\text{Drums as before } \frac{-1{,}480 \times 20}{10} = -2{,}960$$

Total retarding moment, —16,256

Turns during acceleration and retardation same as during hoisting; that is, 5.5 for acceleration and 2.75 for retardation.

TOTAL SUMMATION OF MOMENTS

	Turns					
	0	5.5	5.5	88.25	88.25	91
Net load	—14,000	—13,900	—13,900	—13,650	—13,650	—13,608
Acceleration and retardation.	11,860	11,860	0	0	—16,256	—16,256
	—2,140	—2,040	—13,900	—13,650	—29,906	—29,864

$$\text{Horsepower as before} = \frac{2\pi M \times \text{r.p.s.}}{550}$$

Turns	Moment	Horsepower	Time
0	—2,140	—13.5	360
5.5	—2,040	—12.7	380
5.5	—13,650	—85.6	380
88.25	—13,900	—87.3	530
88.25	—29,906	—188	530
91	—29,864	—187.5	540

This concludes the calculations for the determination of the duty cycles for an unbalanced slope haulage for both hoisting the loads and lowering the empties. The duty cycles as plotted show the power to be delivered by the motor at its coupling to the hoist when it is raising the load and the power that would be put into the motor at its coupling by the downgoing empties. The speed as shown on the duty cycles is the same for both lowering and raising.

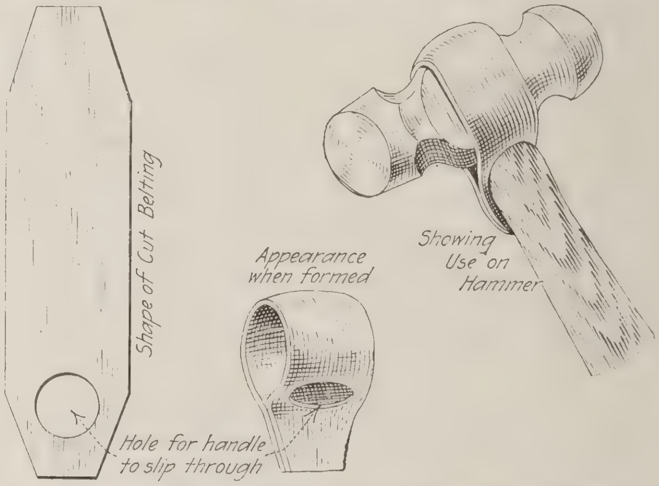
If the lowering were accomplished with the motor pumping back into the line, as is entirely practical in this case, the speed of lowering would be a few points in percentage above the speed of hoisting, as the motor would have to run above synchronous speed before it could become a generator.

The determinations of the proper rating for a motor to meet this cycle will be taken up later in this series of articles.

⁂

A Handy Soft Hammer

An ordinary engineer's hammer can be made to serve in place of a mallet for use on wood or other soft materials by using a piece of leather or belting in the manner shown in the drawing. A hole is cut in the leather large enough to be slipped over the end of the handle and the leather is then slipped to the head of the hammer. The leather is then flapped over the head of the hammer and nailed onto the handle, or the two ends are wrapped to the handle with several turns of fine wire. The hammer is used sidewise on wood, which brings the leather belting into play and softens the blow. In this way the user has a hammer ready for various uses in a compact and convenient form. The leather will wear for a long time.—*American Machinist.*



ENGINEER'S HAMMER WITH LEATHER CUSHIONING

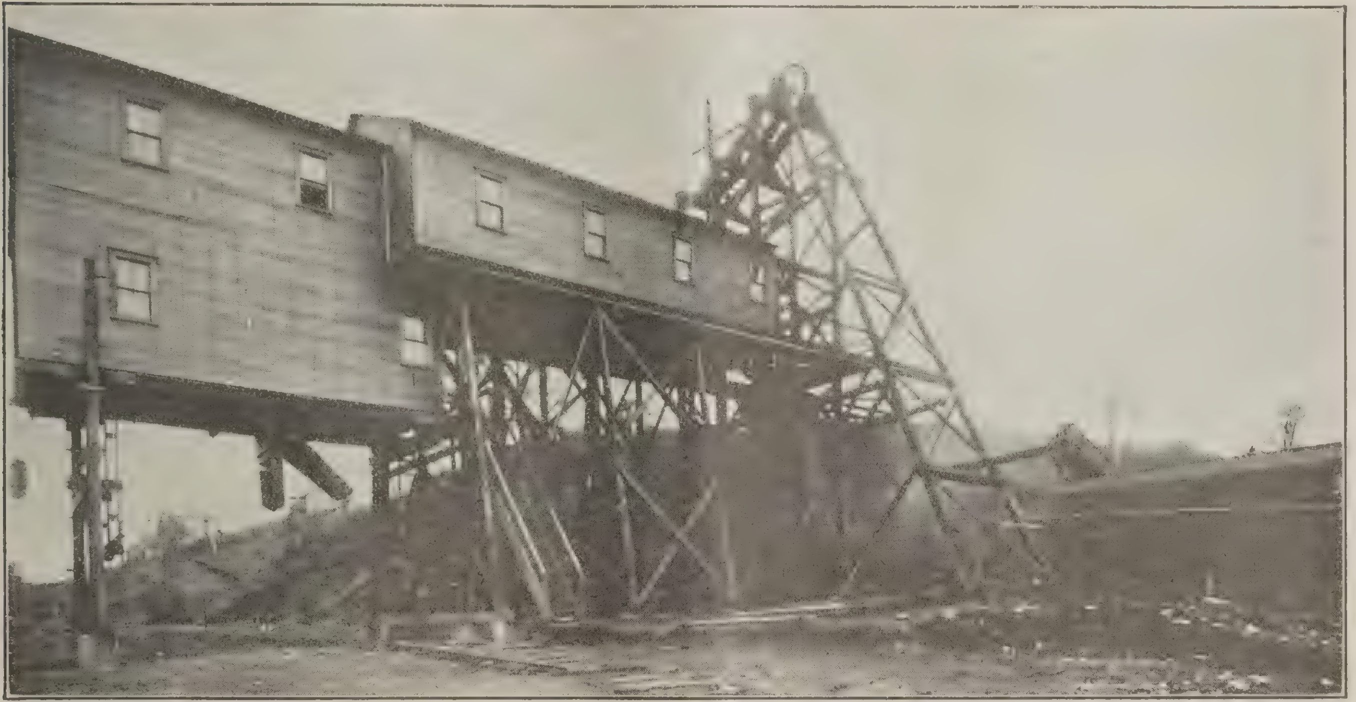
Canonsburg Gas Coal Co.'s Plant

By C. M. Means*

SYNOPSIS—An interesting installation where both alternating and direct current are purchased. This obviates the use of a substation. Electric power is used to drive the fan, pumps, mining machines and haulage. An electric hoist is also employed to lift the coal 150 ft.

It is a well-recognized fact that the design of a mining plant should take into account the size, maximum economical output and life of the mine. The following description covers equipment at a mine of limited area where for commercial reasons it is desirable to limit the daily output to a certain amount.

The Canonsburg Gas Coal Co. has opened a mine in Washington County, Pennsylvania, tapping the Pittsburgh measures with a 154-ft. shaft and an equipment designed for a capacity of 1,000 tons per 8-hr. day. It happens that this mine is in a locality where power can be secured from either of two power companies that serve coal mines extensively. One company was in a position to furnish both alternating and direct current, and the contract was closed with this concern, as the rates of the two companies for alternating power did not differ materially. Direct current is purchased at the rates prevailing for alternating current plus the actual cost of conversion.



TIPPLE AND HEADFRAME OF CANONSBURG GAS COAL CO.'S MINE

Since the company is able to purchase both kinds of current, the use of a substation at the mine is unnecessary. Alternating current at 440 volts is being furnished for the operation of the hoist, ventilating fan and pumps at the bottom of the shaft. Direct current at 500 volts is taken from the busbars of the trolley company's substation and used to operate mining machines, locomotive haulage and all the pumps that are located in the advance workings.

Alternating current is transmitted at high voltage to an outdoor transformer station, at which point the current is stepped down to 440 volts for use at the mine. Direct current is transmitted about 2,000 ft. from the power company's substation to the mine opening, but at a little later date when the underground workings are developed, it will be possible to carry the direct current over a circuit taken down a borehole close to the substation and tap the underground distribution at a central point, thereby securing good voltage regulation throughout the entire mine with a minimum amount of copper for feeder lines.

Ventilation is effected with a disk fan belt-driven by a variable-speed induction motor. A small fan and motor are used for the present, but as soon as the ventilation conditions and requirements are thoroughly ascertained a fan designed to meet the actual conditions at the highest efficiency will be installed, together with a motor of proper size and operating characteristics. Owing to the uncertainty of ventilation requirements at a new mine and the low efficiency of a large fan and motor, it is not advisable to attempt to install a permanent fan until the operating conditions have been fully ascertained.

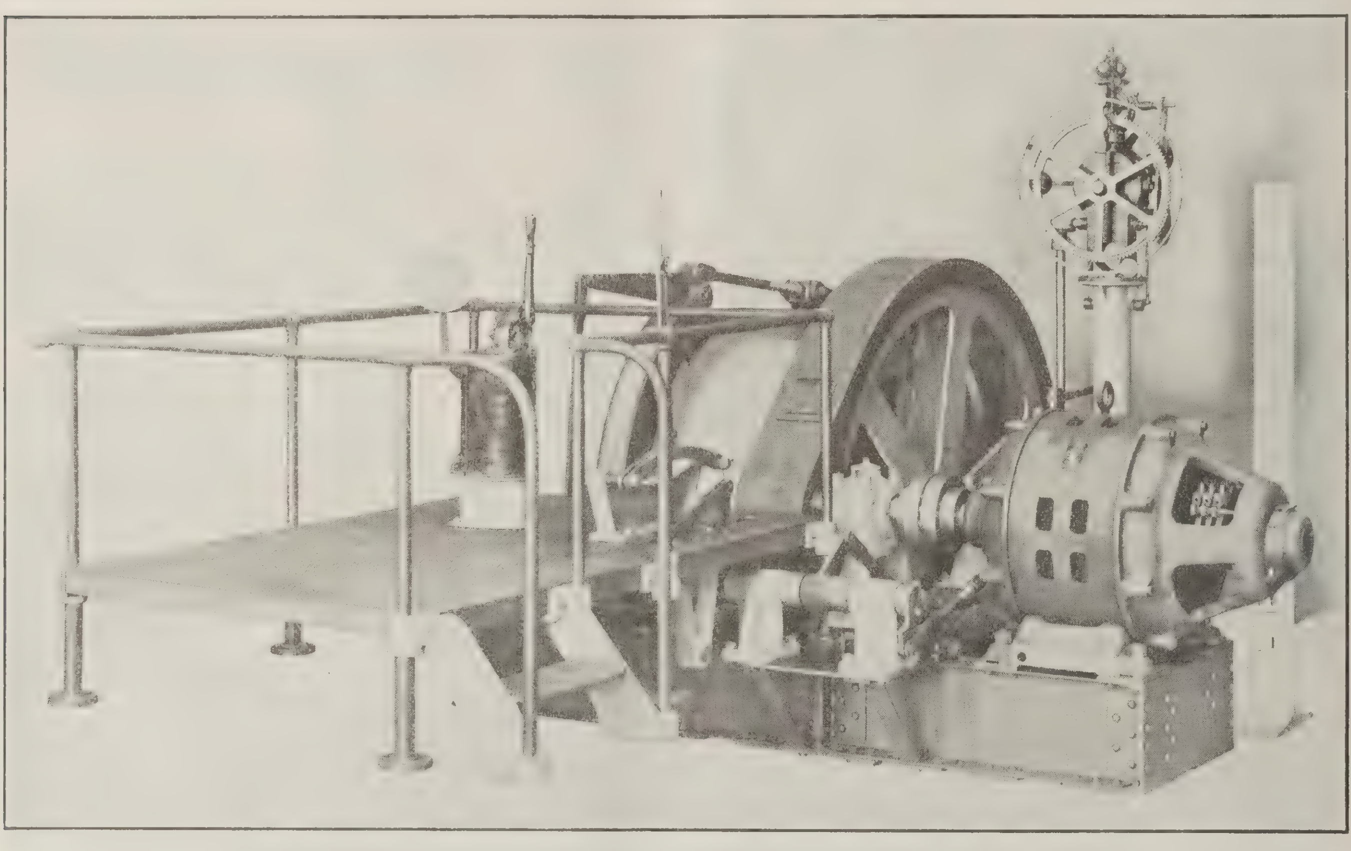
Description of Hoisting Outfit

The hoist is placed at the end of the shaft and consists of a 60-in. single-drum Lidgerwood hoist using a 1⅛-in. rope. It is provided with post brakes and single reduction herringbone cut-steel gears properly protected. The motor consists of a 100-hp. three-phase 60-cycle 440-volt slip-ring motor, connected to the hoist through a flexible coupling specially designed for heavy reversing duty. The control is of the contactor type, and acceleration is performed automatically.

---

*Pittsburgh, Penn.

A suitable safety device is included, which prevents overspeeding and overwinding. It also compels slowing down at the extremes of travel and brings the hoist to rest by setting the brake and cutting off the power should the operator fail to do so. The theoretical power required to hoist a ton of coal at this mine was calculated to be 0.361 kw.-hr. In actual practice it was found that the current consumption was 0.412 kw.-hr. per ton. The duty cycle curve attached herewith shows the operating conditions and the maximum demand created in hoisting.



LIDGERWOOD ELECTRIC AUTOMATIC HOIST AT THE CANONSBURG PLANT

The pumping at the bottom of the shaft is accomplished with plunger-type pumps driven with 440-volt alternating-current motors. Sufficient pumping capacity and sumpage are provided so that all pumping can be done when the other power requirements at the mine are smallest, during what is termed the off-peak period. This results in the corporation securing a low rate for the power used in pumping.

The haulage equipment at present consists of one six-ton gathering locomotive, but additional locomotives of proper size will be added as the workings become extended and the capacity increases up to normal.

The coal is undercut with breast-chain machines, used because of the large amount of narrow work. When it is found that shortwall or other types of mining machines can show an economical advantage, they will be installed, but for the present only those of the breast type will be used.

I am indebted to H. A. Davis, president of the company, for the courtesy extended in securing the information from which this description was prepared.

Winter Meeting of W. Va. Coal Mining Institute

The semiannual meeting of the West Virginia Coal Mining Institute will be held at Fairmont, W. Va., Dec. 8-9, 1915. The Wednesday morning session will open at 10 o'clock, when the following papers will be read: "Relation of Mine Officials to the Consumer," by R. Z. Virgin, Colliers, W. Va., and "Why Buy a Storage Battery Locomotive," by J. R. Cameron, Cincinnati, Ohio. At 2 o'clock in the afternoon R. J. Beaman, Cincinnati, Ohio, will read a paper on "Uniform Accounting and Cost Records as Applied to Coal Mining," and G. E. Greer, Morgantown, W. Va., will follow with a paper entitled "Projecting a Mine on the Panel System," after which a business session will be held.

On Thursday at 9:30 a.m., the following papers will be read: "Some Suggestions and Ideas Based on Observation," by J. W. Bischoff, Elkins, W. Va.; "The Demonstration of a Portable Gas Detector," by G. A. Burrell, Pittsburgh, Penn.; "Day Labor in Bituminous Mines," by G. S. Brackett, Flemington, W. Va. In the afternoon at 2 o'clock papers will be read on "Welfare Engineering as Applied to Coal Mines," by W. F. Hyde, Wheeling, W. Va., and "Needed Reforms in the Coal Mining Industry," by K. F. Schoew, Huntington, W. Va. The afternoon session will end with a symposium relating to the question, "What is the Matter with the Coal Business?" In the evening at 8 o'clock President J. C. McKinley, of Wheeling, W. Va., and Judge W. S. Haymond, of Fairmont, W. Va., will address the institute on matters of interest and importance.

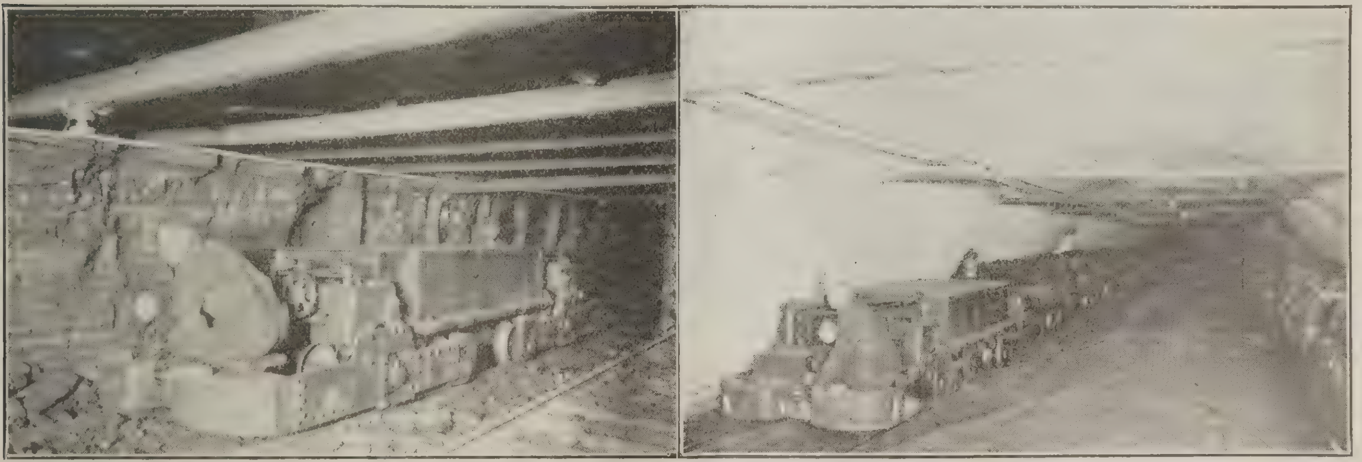
The day sessions will be held in the assembly room of the Watson Building; the meeting place for the evening sessions has not yet been announced.

Novel Combination Locomotive

By E. C. De Wolfe*

SYNOPSIS—Mounting the storage battery of a combination locomotive on a low platform carried between two swiveling trucks each provided with a motor, one pair of drivers and one pair of bogies not only greatly facilitates rounding sharp curves in the track, but provides against electrical overload through wheel slippage. Split-winding of the motors gives two speeds at rated drawbar pull on either battery or trolley.

Not in days of time nor miles of travel can one find a more enthusiastic enthusiast on the storage-battery locomotive proposition than H. M. Stewart, superintendent of the Grant Coal and Mining Co.'s operation at New Goshen, Ind., 11 mi. north and west of Terre Haute. He admits that he has a large ampere-hour capacity of experience, information and opinion on which he can draw heavily for extended periods without slipping a wheel or materially reducing his voltage. And what he says has behind it the weight of authority, for he has done considerable rapid and economical development during the past three years, using storage-battery locomotives for gathering and trolley locomotives for main-haulage work.



FIGS. 1 AND 2. SHOWING ARTICULATED LOCOMOTIVE IN AN ENTRY AND AT THE SHAFT BOTTOM

And while in general the field of usefulness for the storage-battery locomotive is as yet by no means clearly defined, there is no question of its utility in the mind and mine of Superintendent Stewart. Furthermore, although general experience up to the present time does not indicate that the storage-battery locomotive can generally supersede the trolley type for haulage, or the trolley-and-reel type for gathering, nevertheless nothing but storage-battery machines could be furnished to Mr. Stewart for his own use in gathering.

Engineers of the broadest experience seem to agree that the field of particular utility for the storage-battery type of locomotive is now, and will probably continue to be, restricted to special conditions wherein the distinct advantages of wholly independent operation are sufficient, and sufficiently easy of realization, to offset the inherent disadvantages and high cost of the storage battery and the locomotive which it drives. The type will undoubtedly be developed in design and its adaptability to mine conditions thereby improved, so that the range of service suitability may be correspondingly widened.

Mr. Stewart's Novel Form of Combination Locomotive

As a matter of fact, Mr. Stewart—a devotee of the storage-battery locomotive, experienced in its use, familiar with its limitations, keen for its improvement and quick to recognize practical and practicable advancement in its efficiency—has now in service a new storage-battery locomotive of wholly novel form, with numerous features of construction and operation which tend to obviate the disadvantages of older designs and mark long forward steps toward making the type more broadly useful.

This locomotive was built and furnished by the Goodman Manufacturing Co. and is designated as an articulated type—a name naturally suggested by the construction and further justified by the number of particularly advantageous features for which the articulated design is directly responsible.

A storage-battery locomotive is unavoidably heavier than necessary for realization of the tractive effort which can be developed for long operating periods by the battery and the battery-driven motors. Consequently the placing of a battery on a locomotive of substantially standard type, with four wheels, all driven, causes an excess of weight on the drivers and robs the electrical parts of the protection against overload, which is so properly provided by slippage of the wheels in any locomotive of correct design.

Superimposing the battery upon the deck of a locomotive of standard form causes increase of height, which is a feature disadvantageous in many mines for which storage-battery operation is particularly desirable. Such a position of the battery covers the working parts of the machine, thereby interfering with the accessibility. It also raises the center of gravity unduly high.

These fundamental difficulties in use of the standard locomotive form for storage-battery operation are ob-

---

*608 South Dearborn St., Chicago, Ill.

viated in the articulated construction, which also permits incorporation of several additional features which would be wholly impractical in the other arrangement. That is to say, the articulated locomotive is designed throughout with direct reference to the needs and limitations of storage-battery operation.

THE MECHANICAL FEATURES

The battery in the articulated machine is placed low, on a platform carried by the reachbar between two bogy trucks, each of which has a motor geared to one axle. The other axle is idle and is fitted with relatively small wheels, which have clearance for swing underneath the battery platform. Thus the locomotive has eight wheels. over which the total weight may be so distributed as to bring more or less than half on the drivers, as may be desirable.

In Mr. Stewart's locomotive the drivers carry somewhat more than half the weight, and as the total is 6 tons there is at the drivers a track pressure of about 4 tons effective for tractive purposes. At 25-per cent. adhesion, this gives a drawbar pull of 2,000 lb. It is easy to provide electric and mechanical equipment to suit this drawbar pull and thereby afford the wheel-slippage protection so desirable in any electric locomotive.

The construction provides space for an adequate battery—375 amp.-hr. in the present instance—without making the locomotive unduly high or interfering with the accessibility of any of the working parts. The available space for the battery is not subject to hampering limitations, since length can be taken as desired, the only effect of increased length of battery box being to spread the distance between the king bolts of the two trucks, and as these are bogies such spreading does not affect the ease of operation on curves.

Its weight carried on eight wheels, the locomotive will run on lighter track than a machine of similar weight on four wheels. Because of the short wheelbase for each bogy truck, the locomotive will turn short radius curves as easily as a mine car. In fact, the machine as a whole is to be regarded in its track performance as being similar to two coupled mine cars of 3 tons' gross weight each, except that by its better construction and squat proportions it has much greater stability and far less liability to derailment.

In rounding curves, the truck ahead acts like a pilot truck of a railroad locomotive, taking the curves easily and safely. The leading wheels being well in advance of the king pin, the forward end of the battery is started around the turn without shock to track or locomotive, and the whole machine follows with none of the impact effects which in four-wheel locomotives mean heavy flange pressures, jerky turns and track troubles.

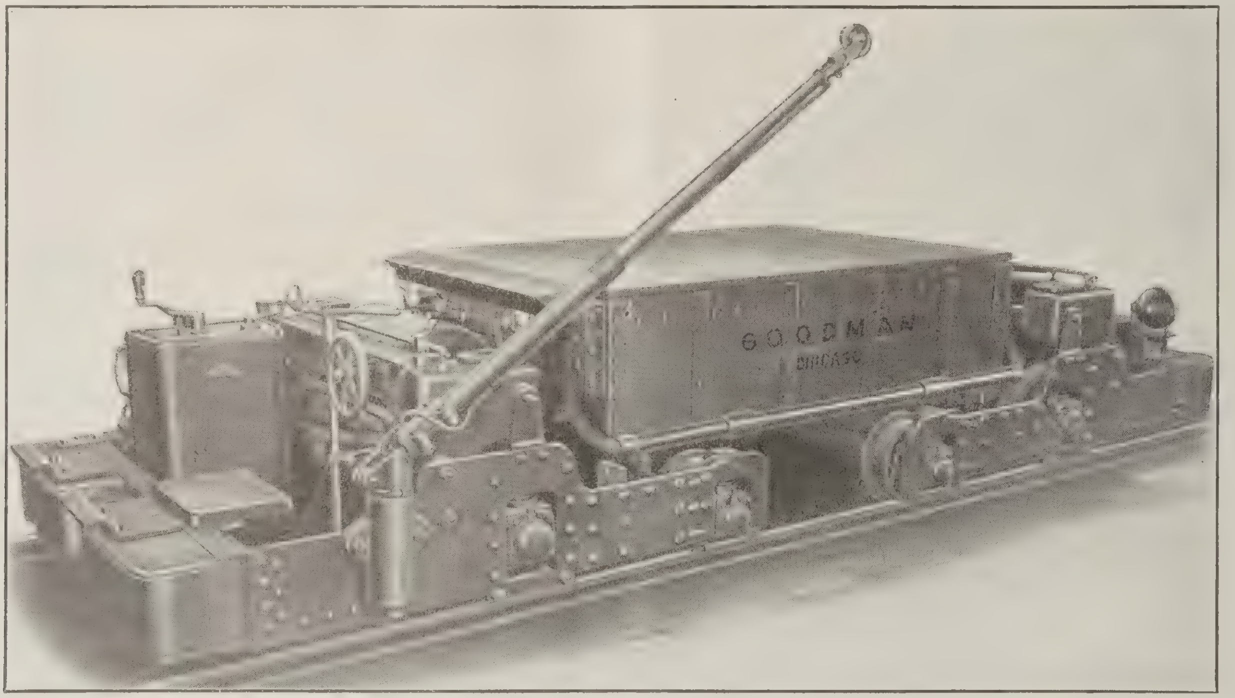


FIG. 3. LOCOMOTIVE WITH TROLLEY ON DRIVER'S END

The articulated construction therefore produces a locomotive which to all operative purposes is as short as a mine car or even shorter. The distance from drawbar pin to driving axle being small, even while providing unusually generous cab spaces for both motorman and trip rider, the drawbar pin is not thrown so far out from the center line of the track in rounding sharp curves nor the corner of the cab so far beyond the outer rail as with a four-wheel locomotive of standard construction. Easy rounding of curves is further facilitated by the ball bearings at the king pins.

The motors and all parts are readily accessible, as they are in no way covered or concealed by the battery. The locomotive is an antifriction machine in all its bearings, and all gears run in oil. Sandboxes are placed high and so give good head for proper flow.

THE ELECTRICAL FEATURES ARE NOVEL

Electrically, the locomotive is equally novel and thorough in design and construction. It is made especially effective and efficient by having split-wound motors and provision for operating by trolley when on the main-haul entries.

The split winding of the motor fields gives two speeds of operation without running on the rheostat, thus conserving the battery charge by avoiding waste of power in the resistance on slow runs. Mr. Stewart's locomotive, at its rated drawbar pull of 1,500 lb., will travel 3½ mi. per hr. on the battery and 6 mi. per hr. on the trolley. The split-wound control gives also a slow speed for each method of operation—2¾ mi. per hr. on the battery and 4¾ mi. per hr. on the trolley, at full rated drawbar pull and without running on the rheostat.

The advantages of this arrangement are obvious. The locomotive can work at either battery speed while gathering from rooms and entry headings, and then at either of the two higher speeds in hauling gathered trips on the trolley-wired entry to the main haul parting or even all the way to the bottom.

These several running speeds give great flexibility and high economy of operation. The use of the trolley on the longer runs not only conserves the battery charge, but also increases the production by speeding up the delivery of trips to the partings and the return with empties. An ample and adequate controller of full locomotive type is provided, to assure proper reliability in this important feature.

The Locomotive in Operation

Loads are hauled from the face in rooms and entries, but empties are dropped off at the room necks and pushed in by the loaders.

The motorman works alone on the locomotive in entering the rooms for loads. The trip rider remains on the entry to couple up the trip, and then he rides in the front cab as the trip is hauled out the butt entry onto the side entry and thence to the main haulage parting. The trolley pole is placed at his end, where he can readily put it up whenever the trolley wiring is available. It could of course be placed at the motorman's end if desired, as may be seen in Fig. 3.

The articulated trucks are exceptionally free in rounding a curve, and the overall height of the locomotive is small as compared to the loaded cars. Higher types of storage-battery locomotives heretofore used in this mine have necessitated extensive brushing of roof—a costly operation which will be greatly reduced where the Goodman locomotive is operated. This lower machine has been useful in territory to which the older ones could not go.

The roof in many places is irregular in contour and quality, and while not so poor as to make trolley wire maintenance on the entries particularly difficult, Superintendent Stewart certainly avoids possible trouble by not stringing any.

He also has been able to get along with half the generating plant otherwise necessary, as only the main-haulage locomotives have to be served during working shifts, the storage batteries being charged at night.

Other Reasons for Storage-Battery Motors

Other operators may find various other reasons for the use of storage-battery locomotives. Among them might be mentioned such conditions as the following:

1. Where additional locomotive service is required and the power plant is already loaded. The storage battery, charged at night, may relieve this situation and avoid the necessity for enlarging the power plant.

2. Where large immediate increase of haulage equipment is required, to meet a sudden demand for coal when time and possibly the temporary character of the demand may not permit or justify enlargement of the power plant.

3. Where the territory served is widely scattered in proportion to the output, making unreasonably expensive the trolley wiring and rail bonding for a regular trolley locomotive.

4. Where, because of gaseous conditions, the mining laws prohibit the use of trolley locomotives on the return air. Under such circumstances a mine already laid out with rooms turned off both entries must have a storage-battery locomotive, or use mules, to serve the back entries on the return airway.

5. Where alternating-current cutting machines are used. Storage batteries may be charged through a rectifier at less expense than for a motor-generator set to drive a trolley locomotive, besides saving the expense of wiring and bonding, which would not be required for nor utilized by the cutting machines.

⁂

Electrically Operated Colliery

By B. H. Stockett*

Starting Apr. 9, 1913, a new colliery 1 mi. west of Shenandoah, Penn., began its unique life—unique in comparison with the surrounding collieries owing to its being operated by electricity. This was the Weston colliery of the Locust Mountain Coal Co.

The only parts of the plant not operated by electricity are the heating system and six steam shovels on the stripping which are used for removing overburden and loading coal. There is a motor equipment of 1,363 hp. electric, divided as follows:

Breaker—three 100-hp. motors for a main drive, one 20-hp. motor for a conveyor line, one 20-hp. motor for a tail-rope haulage on refuse.

Machine shop—one 20-hp. motor for all machines.

Car hoists—two 35-hp. motors.

Compressors—two 100-hp. motors on a short-belt drive.

Plane hoist—one 50-hp. motor on a letting-down plane.

Fans—two 7.5-15-hp. motors running disk-type fans

Locomotives—three 80-hp. motors and one 60-hp motor for haulage.

Pumps—two 10-hp. motors for fresh water to steam shovels, one 50-hp. motor and one 35-hp. motor for wash water.

Miscellaneous—four 5-hp. motors for small hoists used in place of mules, one 3-hp. motor blow for fan in boiler house.

Electric shovel—one 225-hp. motor operating a dragline excavator for stripping purposes.

The company does not own a mule or horse, and everything except actual teaming is done with small hoists and electric locomotives. While in some cases this may seem difficult, it is working out with great success, and all in any way connected with the operation are more than enthusiastic over electricity, both for its ease in operation and its economy.

The power is furnished by the Schuylkill Gas and Electric Co. and is delivered at 4,000 volts alternating current, three phase, 60 cycle. It is then stepped down to 440 volts, which is the regular working voltage. The mine locomotives and some of the inside hoists use 250 volts direct current.

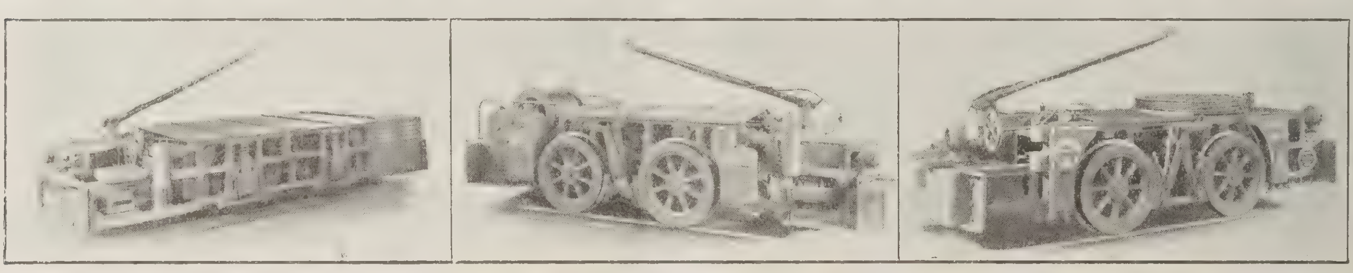
Combination Gathering Motor

By F. J. Foley*

SYNOPSIS—A locomotive low in height and sufficiently powerful to slip its drivers when operating from the battery has been installed to take the place of the reel type of motor. This machine has now been in successful operation for several months.

Few operations in the production of coal for market offer greater opportunities for trouble or expense than the gathering of loaded cars from the rooms and their delivery to the haulage road. Many systems of transportation have been tried with varying success, but none has entirely satisfied the producer that it combined the necessary qualities of reliability, economy and safety.

In the earlier stages of mining in various parts of the world, humans—sometimes men, often women—dragged or carried the coal out in baskets. Later various animals such as horses, mules, oxen and even dogs were tried. In the larger operations, however, the cost of transportation by these means was found to be excessive. While the mule has done and is still doing good work in this field, these animals are expensive, their lives underground are short, they are easily injured and must be fed regularly. Furthermore damage suits from accidents caused by vicious mules have been a source of considerable expense.



FIGS. 1, 2 AND 3. SHOWING COMBINATION AND THE HORIZONTAL AND VERTICAL REEL TYPES OF LOCOMOTIVES

Locomotive Is More Economical

The reel type of gathering locomotive has supplanted the animal in popular favor and has been found to be much less expensive, more reliable and safer, but in many instances this machine has serious drawbacks. There are few operators using this type of gathering locomotive who are not looking for something cheaper, more reliable and less dangerous. The gathering reel has solved many of the old problems, but is still possessed of many features that admit of improvement.

The use of a reel locomotive means overhead-trolley construction up to within about 500 ft. of the working face. Furthermore the track must be bonded unless double conductor cable is used. Such a cable is an item of considerable expense.

Conductor cable is easily damaged, and the cost per locomotive is from $40 to $60 for a 500-ft. cable. The life of such a conductor is not long—in severe service it may not be over one month. There is also the disadvantage that no one knows when this conductor will be damaged and the locomotive possibly be put out of commission for several hours. Cable with badly damaged insulation has caused many serious injuries to the locomotive operators and others.

When the storage-battery locomotive was first successfully operated in the metal-mining field many coal men felt that here was a solution of their difficulties. This proved at least partially true for new operations which were developed especially for this class of gathering, but in mines taking cars from several rooms and hauling them 1,000 to 1,500 ft. to the main haulage road against severe grades the battery locomotive was not economical. Furthermore it was found difficult to keep the height of a storage-battery locomotive down to the proper amount for a mine with a 3-ft. coal bed.

The Combination Locomotive Developed

The best solution appeared to be to combine the good features of both types of locomotives; that is, to construct a machine using the battery for proceeding into the rooms for the individual cars and the trolley for hauling the small trips to the parting. This type of machine has been developed and is now operating quite successfully.

In order to convey a good idea of this type of locomotive, a description will here be given of a machine that has been operating for several months at the Keokee mine of the Stonega Coke and Coal Co., of Big Stone Gap, Va.

Recently this company changed management, and simultaneously changed its operation to central-station power, taking current from the Kentucky Utilities Co. Old methods and equipment are now being discarded and replaced with the most uptodate and efficient methods obtainable.

Local conditions in these mines made the reel locomotive expensive, since the rooms were driven 300 ft. long 50 to 75 ft. on centers. Cross-entries are 2,500 to 3,700 ft. long. The cars weigh 7,700 lb. loaded and 2,000 lb. empty. The trolley locomotive formerly used hauled trips of five cars up a steep grade 300 ft. long. It was also capable of starting a train of four loaded cars on the same grade.

Troubles from failure of the cable, etc., had been frequent at this mine, and the combination locomotive was decided on as the remedy. The following specifications cover the machines now in use: Weight in working order, 6 tons; gage, 3 ft. 8 in.; wheelbase, 3 ft. 9 in.; height to top of frame, 29½ in.; height over all exclusive of trolley, 30 in.; length over all exclusive of bumper blocks, 13 ft. 6 in.; steel-tired wheels, 24-in.

---

*Pittsburgh, Penn.

diameter, 3½-in. tread, with 1x1-in. flanges; width of locomotive over all, 67¼ in., the frames are outside of the wheels.

Mechanically the locomotive is exactly the same as a standard trolley type with "Barsteel" frames, M. C. B. brake shoes and an automatically locking screw type of brake mechanism.

STANDARD MOTOR EQUIPMENT IS USED

The motor equipment is also identical with that used on standard locomotives, being two 28-hp. commutating-pole motors equipped with ball bearings. These motors known as No. 904-C are connected to the axles by single-reduction gearing, consisting of one split cast-steel gear and a special-process steel pinion keyed to the motor shaft. These gears are inclosed in a split case of malleable iron which is both grease-tight and dust-proof. The battery has 48 type 9-MV Ironclad Exide cells as manufactured by the Electric Storage Battery Co., of Philadelphia, Penn. These cells have a normal capacity of 128½ amp.-hr., or 12.1 kw.-hr. The normal rate of discharge is 25.9 amp. for 5 hr.

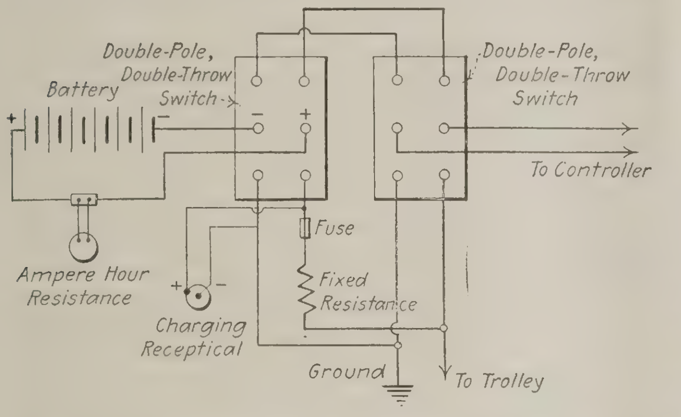


FIG. 4. CONNECTIONS BETWEEN TROLLEY AND STORAGE BATTERY

The battery is arranged in trays so that it may be readily removed. The trays are assembled in steel battery compartments located below the top and between the side frames of the locomotive. The compartments are supported by rolled steel foot plates and cross-members, a weatherproof cover being provided over the battery compartments. The major portion of the battery is at the rear end of the locomotive, the remainder being in front.

The locomotive is designed so that it may be operated from the trolley alone, from the battery alone or from the trolley with the battery being charged. To accomplish these changes two double-pole double-throw switches have been provided to change the connections from the trolley to the battery and vice versa. In addition provision is made so that the battery may be charged at night when the locomotive is not in service. As may be readily seen from the accompanying diagram of connections, these changes may be made almost instantly, so that no delay is occasioned in changing from battery to trolley or the reverse.

TWO SPEEDS ARE ATTAINABLE

Operating from the trolley, the locomotive has a speed of 6 mi. per hr. with a clean, dry rail and a rated voltage of 250 at the trolley. The speed when operating from the battery is 1.3 mi. per hr. based on the average discharge voltage of the accumulator. The starting drawbar pull using sand is 3,600 to 4,000 lb., depending of course on track conditions. The battery is capable of slipping the wheels.

With 30-per cent. adhesion, corresponding to a tractive effort of 3,600 lb., the battery will operate the locomotive at 1 mi. per hr. upon its average discharge voltage, or at 0.6 mi. per hr. with its final voltage.

When working at the one-hour rating of the motor, the locomotive will exert a drawbar pull of 3,350 lb. at either 5.6 mi. per hr. from the 250-volt trolley, or at 1 mi. per hr. from the average voltage of the battery. When exerting a drawbar pull of 1,000 lb., the machine will develop a speed of 8½ mi. per hr. from the 250-volt trolley, or 2¾ mi. per hr. when operating from the battery at average discharge voltage.

THE ADVANTAGES AND DISADVANTAGES

A comparison of the advantages and disadvantages of the combination trolley and storage-battery locomotive is interesting. The advantages are approximately as follows: No track bonding in rooms or butt entries; no overhead trolley construction in rooms; or cable reels; no cable maintenance; no possibility of injury to employees from defective insulation; the ability to pull cars to and from the rooms when the trolley voltage fails; also the ability to run out of the mine even when the current is off from the trolley.

The disadvantages may be summarized as follows: The necessity of provision for charging the battery; a renewal of the battery every two or three years; a slightly higher first cost for the combination machine; the cost of charging the battery.

It would appear from the foregoing that the disadvantages are far outweighed by the advantages, particularly when it is considered that the extra cost of charging the battery over the extent of using the power directly in the motor is but a small percentage of the total cost of power.

In this connection it is interesting to note that the Westinghouse Electric and Manufacturing Co., builder of the machine described, was recently awarded a gold medal at the Panama-Pacific International Exposition for the general excellence of the locomotive of this type which it exhibited. This would appear indicative of the place which the judges consider is open for these combination locomotives.

Operator's Liability for Certified Miner's Negligence—Plaintiff, a laborer in a Pennsylvania anthracite mine, was directed by his superior, a certified miner, to break up a large rock which had been thrown out. This direction was given after the miner had inspected the place and in assuring plaintiff that there were no unexploded shots in the rock. In attempting to break the rock, plaintiff exploded a cap or a quantity of dynamite and was blinded. He sued the employing operator in a New York court, which in upholding his right to recover says: "I think that the presence of dynamite or a cap which, like dynamite, would explode from concussion in a place where a workman is directed to strike with a steel tool is evidence of negligence in setting him at work there in that way." Operators are exempt from liability for negligence of certified mine officials only so far as the carelessness relates to acts within the scope of statutory duties of such officials; so far as an official acts beyond these duties he is the representative of the operator, who is liable for resulting injury to employees. (New York Supreme Court, New York County Trial Term, Martinkovics vs. Lehigh Coal & Navigation Co., 154 New York Supplement, 178.)

Extracts from a Superintendent's Diary

Our prize first-aid team is in disgrace. They went to the "state-wide contest" to represent us and returned home without even notifying the judges that they were in town.

Yesterday they started off bright and early, all dressed in spotless overalls to take the first train into the city (they were afraid that dressing rooms would not be provided at the grounds so they decided to take no chances), and today they returned still conspicuous because of the overalls, but the desire to let their fellow townsmen see them on parade had entirely vanished.

The "patient" of the team (Jim Harper) made the first false step in the ill-starred adventure. He accepted an invitation to take a drink with a former resident whom he happened to meet almost as soon as he arrived in the city, and from that time on he forgot what he had come for and soon slipped the collar. His team-mates, fearing that he would feel his importance too much, had led him to believe the night before that anyone could act as "patient," so he had not left camp bristling with his own importance as had the other five members of the party, and it is not surprising that a few drinks made him forget entirely the main adventure of the day.

When the others realized that the "patient" had wandered off, they roamed about town in search of him and soon found themselves in parts of the city where men dressed in overalls and miners' caps attracted more than passing notice. Soon a motley crowd of street urchins collected at their heels hooting at them and subjecting them to a torrent of sarcastic remarks.

The men took it all with good grace for a time, but finally the remarks became too personal, and Sandy McArthur, captain of the team, lost his temper and, turning about, waded into his tormentors and gave them something to howl about.

The street became alive with patients needing first-aid treatment, but the first-aid squad overlooked its opportunity completely and stood silently by, while its captain inaugurated a reign of terror.

About this time an officer of the law chanced upon the scene and, realizing at a glance the seriousness of the crisis, rushed to the nearest alarm box and sent in a riot call.

Just what happened immediately after the arrival of the police reserves must remain a matter of conjecture until we can obtain evidence not now available. Several hours later the chief of police managed to reach me on long-distance telephone, and I succeeded in getting the team members released on bail, but the information that he gave me does not exactly tally with the narrative of our men, so I have decided to reserve judgment.

By the time the men were released from custody, only a few minutes remained until the time for the first-aid meet to begin, so the chief, realizing their predicament, kindly offered to send them to the field in the police patrol auto, and they accepted his invitation.

But in that, Fate again willed otherwise. Hardly had the automobile started on its journey when in turning a corner it collided with two men, one of whom proved to be the traitorous "patient." When the occupants of the auto got to him he was in need of all of the first-aid talent they possessed, and instead of continuing the journey to the first-aid meet, they were compelled to hurry to a hospital.

Jim's wife was at the station to meet him today when the train rolled in, much to his dismay, and judging by the conversation that drifted back over the hill long after Jim and his wife had faded from sight, Jim may require further first-aid treatment from his team-mates before today's adventure is entirely forgotten.

⁂

Illinois Mining Institute

Special Correspondence

The Illinois Mining Institute held its third annual meeting in the City Hall, Springfield, Ill., Saturday, Nov. 20, beginning at 9:30 a.m. Mayor Baumann welcomed the institute to the city, and the president of the association, J. W. Stark, state mine inspector, of Georgetown, replied and also welcomed the members.

State Mine Inspector David Z. Thrush read a paper upon the topic, "The Mine Manager," which brought out so much discussion at the morning session that upon the request of a number of members who came in during the discussion but after the reading of the paper, it was also read at the afternoon session. Those who took part in the discussion that followed were Thomas Moses, general superintendent, Bunsen Coal Co., Westville; John P. Reese, of the Superior Coal Co., Gillespie; Mr. Burton, of Herrin, a board member of the U. M. W. A.; Mr. Patrick Hogan, and the newly elected president of the institute.

Mr. Burton started the discussion and urged the advisability of getting greater efficiency from the men at the face, saying that in his opinion too much attention is now given to improving the efficiency of company and surface men. Mr. Reese and others held that at present miners are content to earn a less daily wage than they are capable of earning with greater exertion, and that it is difficult to increase the general efficiency of the mine by increasing the output per man beyond this moderate wage. Though different machine loaders have certain rate advantages enabling them to make better wages under certain conditions than other loaders, most of the loaders seem satisfied to make the same average wage and cannot be forced to increase their earning power. It was also claimed that men working three days per week produce more per day than those working six days, and some argued that the six-days-per-week men should increase their daily average to the same amount as the three-days-per-week men. Others opposed this proposition and argued that a man always works harder for part time than if working steadily. This friendly discussion between prominent operators and officials of the miners was most interesting and illustrated the good effects of the mining institute.

The director of the State Geological Survey, F. W. De Wolf, read a paper entitled "Relation of Oil and Gas Wells to Coal Properties," and showed by illustrations several methods proposed by a committee of geologists, engineers and mining men for plugging oil and gas wells that penetrate coal measures. John P. Reese gave an interesting account of the controversy now in progress in the Staunton district of Illinois, caused by the discovery within the past year of oil and gas wells in territory where coal mines are now operating or are projected in the near future.

At the afternoon session, after the rereading of Mr. Thrush's paper, an address entitled "Cleanliness and Order at Coal Mines," by G. E. Lyman, mining engineer of the Madison Coal Corporation, was read by the secretary in the absence of the author. The great waste at many mines owing to disorder was pointed out, the economy of greater order was shown, and also the income available by selling the large amount of scrap that usually is found about mine works. The ideas advanced by Mr. Lyman seemed to be heartily indorsed by a number of speakers.

The following officers were elected for the ensuing year: President, Mr. Burton, of Herrin; first vice-president, Mr. Fehler, of Belleville; second vice-president, Patrick Hogan, of Canton; secretary and treasurer, Martin Bolt, Springfield; executive committee, Messrs. McClintock, Stark, Reese, Simpson and Bolander.

The City of Herrin in southern Illinois was chosen as the place for the next meeting after a spirited contest between Herrin and Duquoin. The president appointed as an auditing committee, Messrs. Fehler, Hogan and Stoek. At the banquet held at the St. Nicholas Hotel at 6:30 p.m., John P. Reese, of Gillespie, acted as toastmaster. The program included toasts by Messrs. David Ross, Bolander, Stark and others and songs by Mr. Hogan.

Pages from a Miner's Notebook: Caste and Cleanliness

I moved next door to the tipple boss recently. He is one of the men employed here who advised me not to join the bathhouse club. "Only the rough-necks wash there," he said.

He came home from work tonight. Behind him came a crowd of the rough-necks. They stopped at the bathhouse, which is a model of cleanliness and convenience, and in a few moments were on their way to their homes, washed, dressed in clean clothes and with their pit clothes hung high up to the ceiling in a good draft of air where by morning they will be dry and well freed from the dampness incident to perspiration.

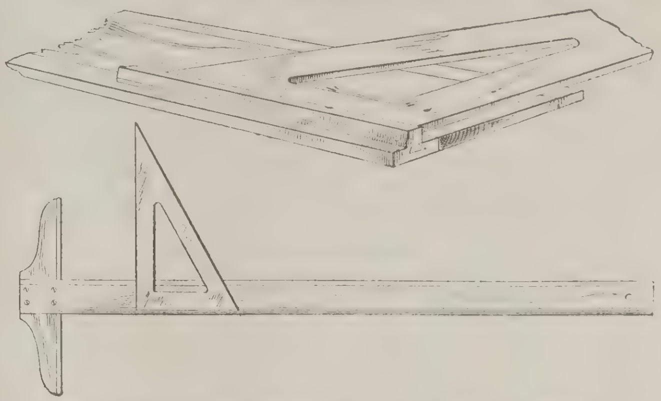
The tipple boss sat on his front steps in his pit clothes, without even washing his hands and face, until long after the roughest rough-neck was comfortably ensconced on his own front porch or busily engaged in his garden. He sat there until his wife called supper, when there was a great rushing about to get into clean clothes. His pit clothes were piled in a corner on the back porch, and he washed hastily in a tub of water which his wife had been forced to draw for him during the heat of the afternoon. Supper was cold and his wife was aggrieved at being kept waiting, which is no wonder, according to my wife.

The clearing away of the table and washing of dishes was late, naturally, and while the rough-necks and their families were on their way to the moving picture show the tipple boss sat waiting for his belated wife, blaming her all the while for being so extremely slow in finishing up the housework.

I wondered at the time just what satisfaction the tipple boss secured from that exclusiveness which prevented his taking his evening bath in the same room or possibly under the same shower as the rough-neck, and I am still wondering.

Device for Inking Over Freshly Drawn Lines

A T-square with three working edges on the bar has recently been patented by E. R. Ruehle & Co., 119 Fulton St., New York City. The third edge is furnished by a stop along the bar. By means of this addition the draftsman's triangle can be slid along the board, but held clear of the tracing, so that additional ink lines can be placed on a drawing without waiting for any fresh lines beneath to dry.—*Engineering and Mining Journal.*



T-SQUARE FOR INKING OVER FRESH LINES

Ravensdale, Wash., Disaster

The worst coal-mining disaster which ever happened in the State of Washington occurred on Nov. 16 at the Ravensdale mine of the Pacific Coast Coal Co., lessors from the Northwestern Improvement Co., a subsidiary of the Northern Pacific Ry. Co., when an explosion the cause of which is yet unknown killed 31 miners working in the third level. Three miners working in the second level were rescued. The shaft, which descends to the mine at an angle of 60 deg., was completely choked by débris between the second and third levels, but by using an auxiliary slope, rescue crews were able to penetrate several hundred feet along the third level. The ventilating shaft and fanhouse were undamaged by the explosion, and this fact permitted the rapid clearing of the air, thus enabling the rescue teams, which came from practically every mine in the district, to do rapid work.

Following his inspection of the mine, State Mine Inspector Bagley stated that so far as he was able to penetrate the auxiliary slope he had not discovered the center of force of the explosion. The mine, he said, was one of the best equipped in the state for the protection of the men working in it. He has visited the property on numerous occasions, the last time being less than a month ago, "and at all times found it meeting every requirement and better provided than the state law required." It was equipped with a sprinkler system, and the third level had been sprinkled on the Sunday preceding the explosion.

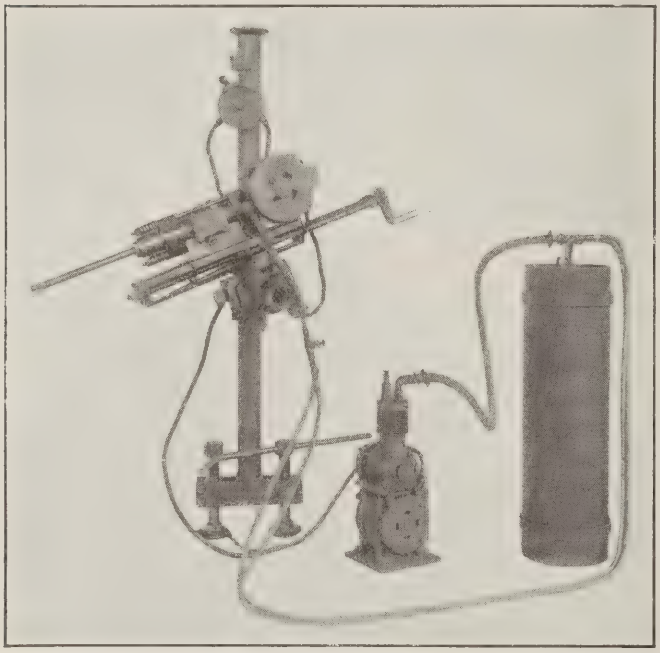
It has been fairly well established that the explosion occurred in the third level east entry. The east and west entries of the third level lie at right angles with the main slope at its bottom. The first is 2,850 ft. long and the second about 2,600 ft. long. The majority of the miners were working in the east entry drawing pillars within 400 ft. of the main slope. It was stated by a miner, who quit early, that the miners drawing pillars fired their own shots and perhaps one of these was poorly placed.

New Apparatus and Equipment

Denver Electric Rock Drill

After several years of practical demonstration, the Denver Rock Drill Manufacturing Co., Eighteenth and Blake Sts., Denver, Colo., has finally put upon the market under strong guarantee a new electrically operated rock-drilling machine. This drill has been built upon principles that have been found thoroughly practical.

The new drills are made in two sizes—one of 2 hp. and one of 4 hp. The structural features in both are identical. The machine is a self-contained, direct-connected unit. The equipment also includes a small auxiliary electrically driven air compressor and an ordinary drill-water tank. Neither compressor nor tank, however, is essential to the operation of the drill proper, but is needed only in the cleaning of the drill hole and in supplying water for drilling.



DENVER ELECTRIC ROCK DRILL AND AUXILIARIES

Each unit is built as light as is compatible with durability and is designed for muleback or horseback transportation when necessary. The claims made by the manufacturers for this drill are its endurance, its drilling speed, its freedom from "fitchering," or sticking, and its low power consumption. It is free from all freezing troubles, and the cost of a complete installation is comparatively small. This renders it particularly suited to remote mining localities where fuel is expensive.

As may be seen in the illustration, the drill motor is mounted behind the drill mechanism proper. It is compact and fully inclosed against dirt and moisture, as well as shock. The coils of the motor are made into compact, solid units, with insulation baked on, thus rendering the coils secure against deterioration from vibration. The motor shaft runs in ball bearings, and the power is delivered to the drill mechanism through an internal reduction gear. The machines are built to operate on three-phase 60-cycle alternating current of 110, 220 or 440 volts' tension. There are consequently no brushes or sliding contacts.

The main portion of the drill comprises two cylinders mounted side by side. One of these contains a piston serving as the pulsator, which is driven by a connecting-rod from the motor gears. This pulsator compresses air in both ends of this cylinder and forces it back and forth into the corresponding ends of the hammer cylinder, where it causes the latter to oscillate with the pulsations of air.

The hammer has a 4-in. travel. As the air is not exhausted from these cylinders, but is drawn back and forth repeatedly, being alternately subjected to compression and suction, it does not become heated, and hence no cooling arrangements are necessary. The pulsator cylinder is provided with a bypass valve, by means of which the operator may instantly cause the pulsations of air to take place between opposite ends of the pulsator cylinder, thus stopping the hammer, or he may adjust the blow of the hammer to any desired intensity.

The drill strikes about 1,200 blows per minute, and the regulation of cutting speed is entirely by means of the bypass valve. It is not necessary, owing to this bypass, to shut off the current in order to interrupt the action of the machine.

Rotation of the drill steel is accomplished by a ratchet and slip-friction set of gears, driven directly from the motor. The steel therefore turns when the hammer is stopped, and in this condition the machine may be used as a boring tool. The steel employed is round and hollow. A portion of the shank about an inch long is swaged square to fit the socket of the drill. The quantities of air and water admitted to the steel are governed independently by valves. The feed is by means of the ordinary shell and screw mechanism. Lubrication of the drill is positive and simple. It is practically impossible to lose a drill hole with this machine.

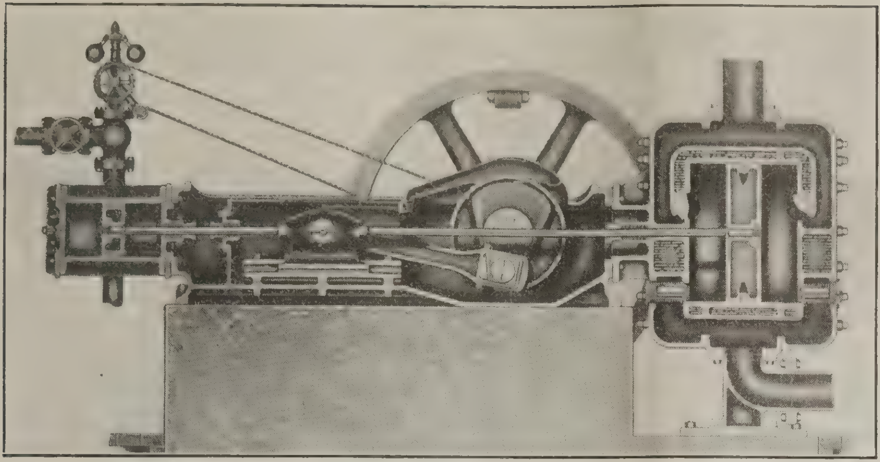
The electric switch governing the machine is constructed shock-proof. Movement of the handle to the first notch starts the compressor running, while movement to the second notch throws the drill motor into action.

*

A New Vacuum Pump

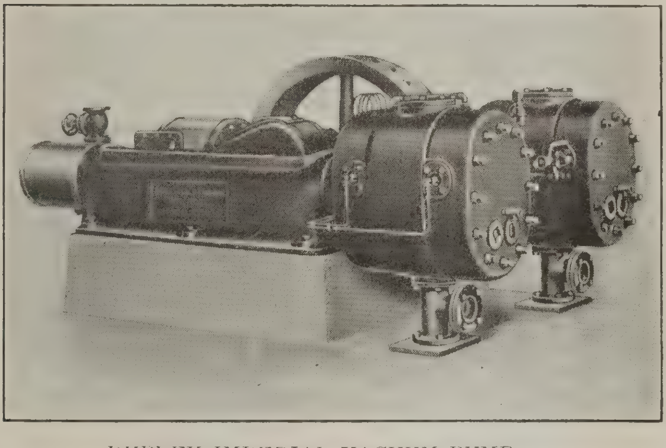
The degree of advantage obtained from the use of condensing apparatus is dependent upon the vacuum maintained. For the purpose of securing and maintaining a high vacuum, the Ingersoll-Rand Co., 11 Broadway, New York, has recently introduced a line of steam- and power-driven duplex-type Imperial vacuum pumps.

Differing from the usual design of such machines, the intake valves in the vacuum cylinders of these pumps are of the corliss type and so placed in the cylinder head that the clearance is extremely small. This is a desirable feature in that air trapped in the clearance space



SECTION THROUGH IMPERIAL VACUUM PUMP

at discharge pressure will not reach such a volume upon expanding to intake pressure as to greatly limit the pressure reduction which may be obtained. The action of this valve is positive and rapid, being independent of the cylinder and intake pressures. The intake ports are large and direct. This, together with the water-jacketing of the valve, tends to cool the intake gases. The discharge valves are of the direct-lift poppet type and are placed in the bottom of the cylinder heads so that any entrained moisture or water is immediately discharged. Clearance at the point of discharge has been reduced by making the valve partially fill the port in the cylinder head. The discharge passages are also water-jacketed. The low clearance space in these vacuum pumps has been obtained, not by permitting the piston to come into dangerously close proximity to the cylinder head, but by a careful design of the valves and valve ports. Owing to the extremely low clearance, the complete water-jacketing, the corliss inlet valve and other refinements of design, the manufacturer guarantees the easy maintenance of a vacuum within 1½ in. of the barometer.



DUPLEX IMPERIAL VACUUM PUMP

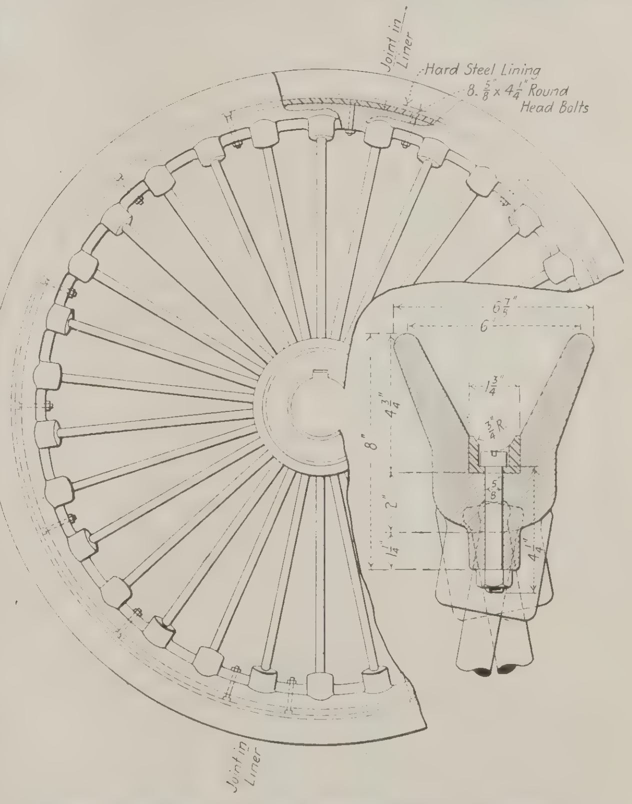
Lubrication of these machines is by the bath system, providing flood lubrication, yet retaining by the removal of covers from the casing a high degree of accessibility. When in operation the flywheel is practically the only visible moving part, yet the entire mechanism is readily accessible while in motion.

In reality a duplex machine, such as this, is two identical units of like capacity united by a common frame and a shaft with two cranks at 90 deg. from each other. This makes it possible, should requirements fall temporarily below that for which the machine was originally installed, to remove one connecting-rod and continue operation with one-half of the machine idle, while the other half of course works at its utmost efficiency, but removes only one-half of the air and vapor handled by the entire machine.

These machines are built in capacities from 795 to 7,048 cu.ft. per min., both for atmospheric and low-pressure discharge. It is claimed by the manufacturer that these pumps operate practically independently of attention and are thoroughly efficient and economical machines for maintaining a high vacuum in practically any type of condenser.

A New Type of Sheave

It is almost the universal practice at coal-mine shafts to lead the cables from the hoisting cages over sheaves on the headframe and thence to the drums of the hoist. The cable is thus caused to follow and bend around the rim of the sheave for a distance of almost 180 deg. As a result of this bending and the consequent slight slipping and working of the cable strands upon themselves and upon the sheave the wear upon the rim of this wheel is considerable.



NEW SHEAVE WITH RENEWABLE LINING

To lessen the wear upon the sheave rim as well as to render easy repairs thereto possible, the Litchfield Foundry and Machine Co., Litchfield, Ill., is offering to the coal-mining industry a sheave with a renewable wearing rim of hard steel, as shown in the illustration.

As may be seen, this renewable rim is made in halves, each of which is held in place by eight ⅝x4¼-in. special bolts. It is thus an easy matter to remove a worn liner and replace it with a new one, making the sheave practically as good as at first. With a headframe equipped with sheaves of this type, it should not be necessary to carry an extra sheave as a spare, a pair of sheave liners answering every purpose.

The "Simplate" Valve

To insure higher mechanical and volumetric efficiency and to simplify air-compressor cylinder design, the Chicago Pneumatic Tool Co., 1080 Fisher Building, Chicago, Ill., has recently placed on the market the "Simplate" valve, which is of the flat-plate design. The valve has several distinctive features and the chief advantages claimed for it are that it is simple; that its plates are independent in action, one of another; that each plate has its individual springs; that the tensions of the springs on the inlet and discharge valves differ according to the density of the air handled: and finally, that it is applicable to all positions and conditions.

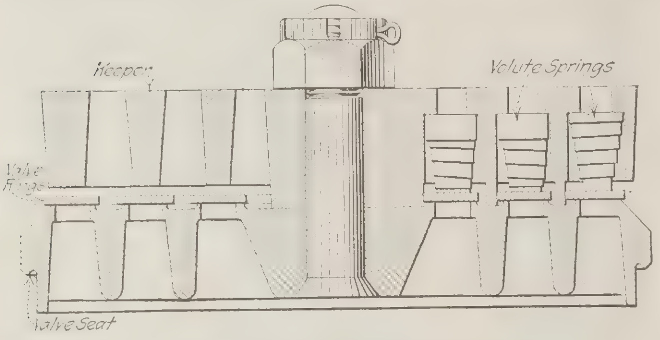


FIG. 1. "SIMPLATE" DISCHARGE VALVE

Fig. 1 shows a section through a discharge valve. The seat is cast from a special alloy steel, heat-treated, oil-tempered and ground true on one side. As shown in the illustration, the seat has circular ports and it is machined so that the raised portion, or the point on which the plates rest forming the joints, is narrow, thus reducing the unbalanced area of the valve. The keeper is of the same material. It is provided with suitable ports for the free passage of the air through it and also furnishes guides for the valve plates and pockets for the valve springs. The latter are of the volute type and are made of high-grade crucible steel. The valves are simple concentric steel plates of uniform section, with a separate and independent plate over each port. Each plate is independently governed by its own spring, hence the action or opening of each valve is entirely independent of the other. Should one of the plates open, the next one to it does not need to move unless the speed conditions should demand it. Ordinarily the outer plate opens when the compressor is running at slow speed, when running at intermediate speed two plates operate, and at full speed all valves are open. The parts making up a complete valve are assembled and held together by a nickel-steel stud and castle nut, and when this nut is tightened in place it is held by the cotter pin.

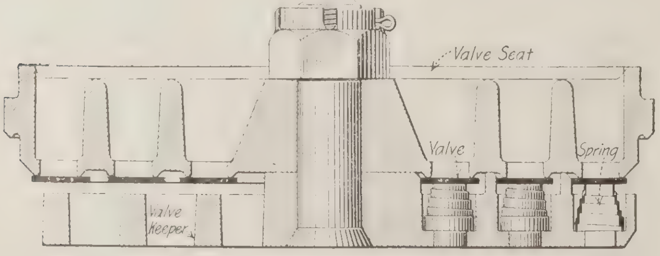

FIG. 2. "SIMPLATE" INLET VALVE

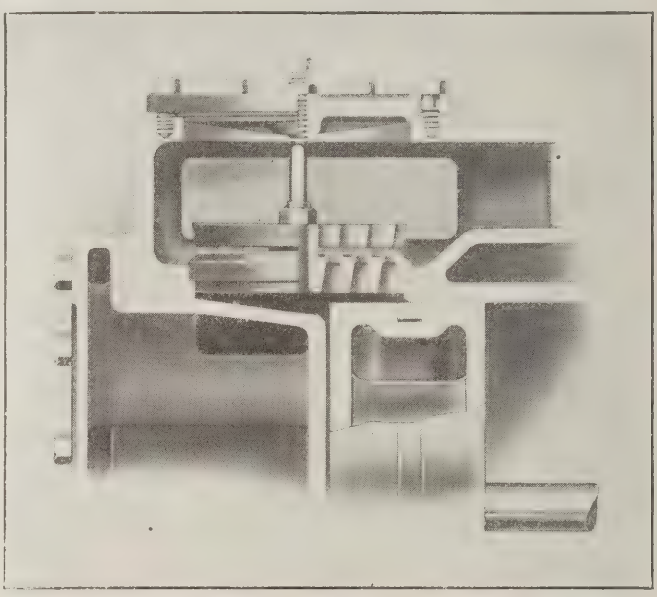

FIG. 3. POSITION OF VALVES IN AIR CYLINDER

As shown in Fig. 2, the construction of the inlet valve is similar to that of the discharge valve. It differs in that the keeper is thinner and the springs have lighter tension. On account of this difference in thickness, inlet and discharge valves cannot be reversed. The spring tension on the inlet valves is light in order to derive the full benefit of the various openings of the different plates when the piston speed is changed. For example, with an inlet valve of the size shown herewith, the spring tension is so calibrated that the outer plate opens with a pressure of but ¼ oz. per sq.in., while 1 oz. will open the intermediate plate and 2½ oz. the inner plate. The valves are said to be noiseless in operation, and their location in the cylinder is convenient for examination or repair, as indicated in Fig. 3. Top and bottom views of the valve are shown in Fig. 4. It is equally suited to high- and low-pressure work and requires no lubrication. A feature worth noting is that all valve parts are interchangeable.

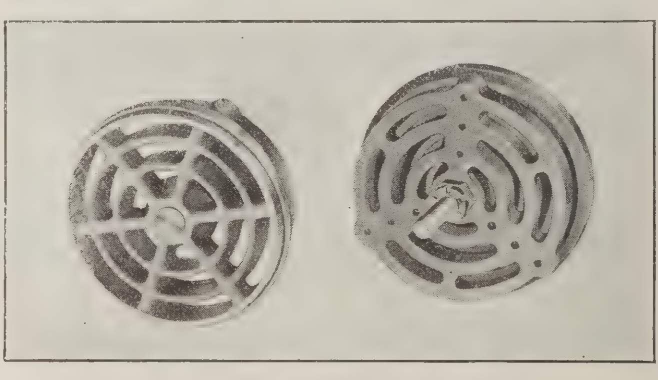

FIG. 4. THE "SIMPLATE" VALVE

Who's Who in Coal Mining

T. M. Dodson

A number of young men are coming forward and fast filling positions of trust and importance in the anthracite field. Some of them have chosen the coal business as a lifework merely by accident. Others have been bred and born to it, and such a one is Truman Dodson, one of the youngest general managers of hard-coal mines.

Mr. Dodson's forbears were interested in coal mining a long time ago, and the black mineral was introduced to him at an unusually early age. It isn't always that sons of fathers can truthfully be called "chips of the old block," but such an appellation fits "Trot" Dodson, for starting as a most unimportant cog in the organization of the Dodson coal interests, he has won the respect of all his associates and risen to his present post of authority by giving close attention to the work at hand.

TRUMAN MONROE DODSON

Mr. Dodson was graduated from Lehigh University in 1900. Following the completion of his college training, he was given employment in West Virginia at the mines of the Garrett County Coal Mining Co. and the Monroe Coal Mining Co. at Barnum. These operations received his undivided attention until 1904, affording him a broad experience in the primary essentials of the mining business. Leaving West Virginia, he became manager of the mines of the Weston Coal and Coke Co. and the Osceola Coal and Coke Co. at Osceola Mills, Penn. Here he remained for two years, after which he moved to Morea Colliery, Penn., to become superintendent of the large Morea and Kaska William collieries.

After receiving valuable experience as mine superintendent at Morea, Truman Dodson in 1907 was appointed general manager of all the Weston, Dodson & Co., Inc., coal and mining interests, including the Beaver Brook colliery at Audenried, Penn. The large output and the many important improvements at the Dodson mines in recent years bear witness to the effective management of Mr. Dodson. A large part of his attention at the present time is being directed to improving the environments of his employees. A new and modern mining village that is now being erected at one of his collieries is an evidence of his interest in sociological work.

"Trot" Dodson is the sort of young man who doesn't need to stretch his imagination to realize that coal mining is a business with aims and ideals other than the payment of dividends and the accumulation of a fat surplus reserve. He is modern in his ideas, human in his instincts and charitable in his practices—the sort of fellow who can be fair to himself and those he serves without forgetting or overlooking the rights of those who serve him.

Mr. Dodson is a member of the American Institute of Mining Engineers and an enthusiastic alumnus of Lehigh University. He is at present general manager of five large coal companies controlled by the Dodson family and those associated with it in the mining business.

Recent Legal Decisions

Reasonableness of Intrastate Coal Freight Rates—In fixing intrastate freight rates on coal shipments, a state railroad commission may validly use as a basis voluntary intermediate rates established and long maintained by railroad companies. (Kansas Supreme Court, Union Pacific Ry. Co. vs. Public Utilities Commission, 148 Pacific Reporter, 667.)

Operator Not Liable for Independent Contractor's Negligence—Where a mining company employs a contractor to construct a tunnel according to specifications, and he is left free as to the means and methods of doing the work, the company cannot be held responsible for injuries to one of his employees, caused by discharge of a "missed hole" and due to the negligence of the contractor in failing to warn the employee against the danger or to promulgate rules to prevent such accidents. (Utah Supreme Court, Dayton vs. Free, 148 Pacific Reporter, 408.)

Imputed Notice to Corporations—Although a corporation is not chargeable with notice given one of its employees concerning a fact not within the scope of his employment, a company engaged in selling coal is chargeable with notice given its assistant sales agent that defendant would no longer guarantee payment for coal delivered to a third party, where the principal sales agent of the company was absent and the assistant was apparently in charge of the corporation's general offices. (Washington Supreme Court, Canadian Collieries, Ltd., vs. Humphrey, 148 Pacific Reporter, 573.)

Operator's Liability for Gas Explosion—Where a gas explosion in a mine was attributable to negligence of the fireboss in failing to make proper inspection, the operator's liability for injury to a miner is not affected by previous negligence of the miner in failing to pierce an opening through a horseback so that the boss could get through to make inspection, nor by the fact that the day before the accident the injured miner disregarded a warning to stay out until arrival of the fireboss. (Kansas Supreme Court, Oplotnik vs. Cherokee & Pittsburgh Coal and Mining Co., 148 Pacific Reporter, 616.)

COMING MEETINGS

American Society of Mechanical Engineers will hold its annual meeting Dec. 7-10, 1915, New York City. Secretary, Calvin W. Rice, 29 West 39th St., New York City.

Coal Mining Institute of America will hold its winter meeting Dec. 21-23, 1915, at the Fort Pitt Hotel, Pittsburgh, Penn. Secretary, C. L. Fay, Wilkes-Barre, Penn.

Engineers' Society of Western Pennsylvania holds its monthly meeting third Tuesday of each month; section meeting, first Tuesday. Secretary, Elmer K. Hiles, Oliver Building, Pittsburgh, Penn.

Western Society of Engineers, Chicago, Ill., holds its regular meeting first Wednesday of each month, excepting July and August. Secretary, J. H. Warder, 1785 Monadnock Block, Chicago, Ill.

The Labor Situation

SYNOPSIS—Trouble at Lehigh Coal and Navigation Co.'s mines ends. At Maryd, Penn., of the Maryd Coal Co. men all but 12 are at work. The Madeira-Hill Coal Mining Co. and the Rochester & Pittsburgh Coal and Iron Co. have strikes at their mines. In Ohio, J. T. Daniels testifies that the rate from Corning to Toledo is 33c. too high.

For the first time in many weeks the collieries of the Lehigh Coal and Navigation Co. in the Panther Creek Valley have been able to work a whole week without a strike of any kind. The miners working for this company have gone on strike and returned to work without any conference with either the union leaders or the company officials. They appear to stay at home till they are tired and then they go back to the mines.

In Maryd, near Tamaqua, Penn., the miners of the Maryd Coal Co., a subsidiary of J. S. Wentz & Co., have objected to a certain portion of the mines being operated with the aid of safety lamps without the men being remunerated for what they regard as a handicap. At first the men all went on strike, but this method of attack seemed more grievous to the miners than to the company, and the employees have now made up their minds to return to work, but to pay the living expenses of the 12 men whose work would normally be in the safety-light zone, but who by orders of the miners and their own inclination are now idle.

The employees working for the Madeira-Hill Coal Mining Co. allege that the company is violating the 1912 agreement for certain kinds of underground work. So 800 men and boys went on strike at the Stanton colliery on Nov. 23. The officials of the United Mine Workers are endeavoring to effect a settlement. Of course, such a strike is in violation of the ruling of the arbitration commission.

Want Higher Wages in Central Pennsylvania

The members of the United Mine Workers of America employed at the Rochester & Pittsburgh Coal and Iron Co.'s mine at Adrian (post office Delancey), Jefferson County, Penn., went on strike on Nov. 20, and the miners at the Florence mine of the same company laid down their tools in sympathy. The loaders want 45c. instead of 37.5c. per ton for loading coal and a day instead of a ton scale in the headings. The miners ask for $3.30 per day in wet headings and $2.64 where these places are dry.

The company has informed the miners that a strike is a violation of the agreement. A strike for increased wages is particularly discreditable to the organization, seeing that the contract provides for the maintenance of the scale till April 1, 1916.

It should be stated, however, that the miners claim that the headings in Adrian had become abnormal and that a new scale should be provided to meet the new condition. James Marks, a board member of district No. 2, says that the Florence strike was not in sympathy with that at Adrian, but that the miners struck because the company was violating the contract in every particular. About 700 men in all are affected.

At the Florence mine near Martins Ferry, Ohio, operated by the Youghiogheny & Ohio Coal Co., it is stated that the mine foreman asked four men to work 5 min. after quitting time, using unprintable language when the men failed to acquiesce. The foreman was attacked by two or more men, and as a result a trip-rider and three electric locomotive men were discharged. As a result 350 men went on strike in violation of their contract by which striking is forbidden.

The labor situation in Ohio and West Virginia still centers round the uncertain freight-rate question. The West Virginia people somewhat generally believe that the firm stand of the Chesapeake & Ohio Ry. in demanding an increase in western Pennsylvania rates as large as the increase in Ohio rates has made Pennsylvania and West Virginia a unit in demanding a maintenance of the present freight rates. They regard the action as quite shrewd and feel assured that the final rates will give Ohio only a trifling advantage in the market and Pennsylvania none at all, but rather an inferior position.

It now develops that coal shippers, who expected to get refunds from the Hocking Valley Ry. Co. for the difference between the old and the new rates, which amounts to 15c. per ton, will have much to do before they are reimbursed in full. The railroad company is now litigating its liability for the refund in question.

The Hocking Valley Ry. Co., in July, 1911, sought by a suit to stop the enforcement of an order which had been made by the Public Service Commission of Ohio. The company lost the suit in September, 1915, and the rate was cut from $1 to 85c. Shippers have been expecting a refund of the 15c. overcharge. Not all the claims have been filed, but coal men have estimated that they would aggregate about $200,000.

When the litigation was opened, the court hearing the case required bonds to be filed by the company to protect shippers in case the rate was found to be too high, and as a result the company was bonded in the aggregate sum of $33,000. The position and claim of the company was made plain in an answer filed with the utilities commission, in which it held that its financial liability for refund to shippers was limited to the security which the court had required. It took the position that if the claims exceeded the bonds the money could be prorated among the claimants.

The company took this position in an answer to a claim of $264 made by T. E. McElfresh, of Delaware. It asked for the dismissal of the suit by the commission for lack of jurisdiction and set forth that the whole matter was a piece of litigation in the courts and that the bonds were given under court orders. The bonds were not and never were under the direction or control of the commission. The claimants, the road's counsel contends, must go to the courts.

Under the law any rate judicially determined is to be the just and legal tariff for one year. The question is to be brought up if the claims may be filed for the entire period of the litigation or only for the year during which the rate is free from legal attack. That is still another limitation that may be urged against the claimants for refund.

The coal-rate case ending before the Ohio Utilities Commission which is being prosecuted by the Sunday Creek Coal Co. and the United Mine Workers of America in Ohio was resumed last week after a long recess which was allowed so that the evidence given might be tabulated. It was disclosed in the hearing that the defendant railroads, the Hocking Valley Ry. and the Toledo & Ohio Central Ry., will take at least a week in the defense and probably longer. The case will be bitterly fought on both sides and the recent action of railroads in Middle West territory will have no bearing on the prosecution of the case. The complainants rested their case Nov. 23, although they will probably call witnesses in rebuttal.

Rates Should Be Lowered 33c. per Ton

The first witness to take the stand after the three weeks' recess was W. M. Hopkins, of Chicago, the rate expert retained by the Sunday Creek Coal Co. He was reëxamined as to the exhibits he had prepared to show the alleged injustice of the present 85c. rate on the Hocking Valley Ry. from the Nelsonville assembling yards to Toledo. His testimony on these documents closed the Sunday Creek case against this defendant. The witness was continued on the stand, however, to explain exhibits he had submitted in the attack upon the rates from Corning to Toledo over the lines of the Toledo & Ohio Central Ry., co-defendant in the case.

A forceful witness was found in J. T. Daniels, of Columbus, a former freight-traffic man, but now engaged in rate-expert work. His exhibits were confined to showing what the Corning-Toledo rate would be if based on the same ton-mile charge as rates from various West Virginia, Kentucky and Tennessee fields into Toledo. He had also submitted exhibits in the testimony against the Hocking Valley Ry. The contention of both Hopkins and Daniels was that the Corning-Toledo rate, including assembling and terminal expense, should be about 67c., instead of $1 as now in force.

Farmers Will Try Accused Colorado Miners

Nearly 100 cases arising out of the rioting in Huerfano County will be transferred to the district court at Castle Rock, Douglas County, Colo. This is the center of a farming, dairying and stock-raising section. The only mining interest is limited to quarrying.

The county lies between Denver and Colorado Springs. The court is presided over by Judge Dennison, who has been appointed to try the cases instead of Judge Hillyer, who was debarred from sitting in judgment in these trials by the Supreme Court of the state. State Attorney Farrar agreed to the change which was requested by Attorney Hawkins, the chief counsel for the United Mine Workers of America.

Editorials

Wake Up!

The anthracite fields have always been conservative. They have been far separated from the bituminous districts in miles and in topography, but much farther in thought and custom. Years ago the bituminous fields became overdeveloped, and the operators were forced to try everything that promised any economy of production if they wished to remain in business. They tried a great many things that did not fulfill their promises, but some of the things stuck. This is true of methods as well as of appliances. Nowadays anthracite is being pushed very hard in the market by bituminous coal and the anthracite operators must adopt every possible economy if they expect to retain a fair share of the business. There are some fields in which they cannot compete with soft coal (they cannot reach most of the steam markets, for instance), but anthracite has qualities which make its use highly desirable for some purposes.

If the anthracite people wish to retain their place in the fuel industry, they will have to fight for it and fight intelligently. They need to employ the most economical methods of production. They need to ship clean coal and nothing else. They need to clean it and size it efficiently and cheaply, by machinery as far as possible. And they need to show people how to use it; for there is no doubt that a large market is being lost which might be saved if the anthracite producers would teach people how to use coal. There ought to be a research bureau in the anthracite field devoted to the investigation of the properties of different hard coals and the proper ways to use the different coals and different sizes.

The anthracite people need above all to get away from a conservatism which is not the dignity of conscious rectitude, but merely the fear of innovation. They need to get up and hustle, and it looks as if they would have to do it very soon. Some of them are doing it now.

⁂

Will Mine Foremen's Certificates Be Necessary?

So many letters have been received asking whether mine foremen's certificates will be necessary in Pennsylvania after the New Year that it seems a few words might be desirable. The answer is "By law, no, and in practice, yes."

West Virginia has had certificated men for years, but until May 6, 1915, the state left it to the judgment of the operator whether he employed such men or satisfied himself with those who had not qualified. To his credit, be it said, the West Virginia mine owner rose to the occasion and in most cases employed only certificated men. A competent man always has his value, and the operators recognized that the certificate at least bore evidence as to qualifications along certain lines, though it told of course almost nothing about administrative ability.

But there is another view of this matter. We may well suppose that the State Workmen's Insurance Fund, the various private corporations undertaking liability insurance and the mutual insurance companies will all demand that the mines be run in a safe way. They will not be content to have an uncertificated man in charge. In fact it looks as if the act permitting uncertificated men to manage mines is nullified by the compensation bill and by the act creating a state insurance fund. That latter enactment clearly gives the State board a right to say what precautions shall be taken, for it says that "the board shall make reasonable rules and regulations for the prevention of injuries upon the premises of the subscribers, and they may refuse to insure, or may terminate the insurance of, any subscriber who refuses to permit such examinations or disregards such rules or regulations and may forfeit one-half of the unearned premiums previously paid by him."

What more reasonable rule can there be than that there should be a certificated foreman in charge of the mine and indeed that he should be in control? It may not be legally necessary for operation and yet absolutely mandatory for insurance. The man who insures with the State board has put his burden on the state in return for certain payments based on his payroll, and he has agreed to follow its requirements. Consequently the constitutional provision which inadvertently relieves him from responsibility if he employs one of a group of men certificated by the state no longer has any power.

He has entered into a contractual relation with the state in which he agrees to put a man in charge and that man a certificated man, and in return and for certain other valuable consideration the state agrees to provide from its funds for compensation. The operator could deal with some other concern than the state as with a private or a mutual company, but he does not. With his own free will he makes an arrangement with the State board, and it is such a one as the board decides to make. It hardly seems likely that the courts will rule that the State Insurance Board can lay no heavier burden on the coal industry than is provided by the provisions of the statute law relating to mines.

Perhaps, after all, the state of innocuous desuetude will be not that of the certificated foreman, but of the mine inspector. It is a serious question to this body of efficient men whether their occupation will not be gone when the State board and the private companies are making more stringent rulings than the mine inspectors are allowed to make under the statute law. Such companies as the Susquehanna Coal Co. and the H. C. Frick Coke Co.—though it is not fair to select these two from many others doing excellent work—already make inspection largely vain. What will happen then when all the companies will say to the inspectors, "Our mines are inspected under a more stringent rule than yours; more onerous conditions are met than you are allowed to impose and there remains absolutely nothing under the law which you can require of us?" When this becomes general the trade of the mine inspector as an official to enforce the law will be gone, and he will be replaced by the man who is authorized to demand that the arbitrary rules of the State board and insurance corporations be followed.

The complaint has been somewhat general that the letter of the law is being followed by the inspection service and not the spirit of the enactments. It is doubtless true, for the inspectors are bound to follow the law verbally because the judges and juries to whom they will be answerable for any neglect are bound by the letter of the statute.

In clear contrast with this state of affairs in the state inspectorate will be found the conditions under insurance inspection. The inspectors of the insurance authorities will be able to get reasonable interpretations on the rulings of their central offices. An order issued by such an office can be modified in a week, whereas a new law may take three years.

In fact the operator will find conditions in the future more as they are in Great Britain and Canada. There, orders in council are issued which have the value of laws and supplement the statutes. They are arbitrarily imposed and more grievous than the statute law, but they can be modified by the power that issues them if they prove unfair or unsatisfactory.

If the Pennsylvania operators had been face to face with an order of council or the ruling of an insurance company when they were required to drill gas holes ahead of their operations, they would have found a more elastic correctible instrument than the law of June 9, 1911, against which protest and reason are alike vain.

Cape Cod Canal's Usefulness

Although the Cape Cod Canal has been open more than 15 months, there is still a divided opinion as to its usefulness. So far it has not had an opportunity to serve any vessels from ports south of New York, partly because it was only in July that it was deepened to 18 ft. and partly because there is not any considerable saving in distance for boats from Philadelphia and the Chesapeake.

The Eastern Steamship Corporation for a time sent through some of its New York freight steamers, boats of the "H. F. Dimock" and "Herman Winter" type, about 272 ft. long and of 2,700 gross tons. Also, the steamer "Lansing," of 1,600 tons' gross registry, but now usually carrying less than 700 tons of coal, has been using the canal regularly. Aside, however, from the two lines of coal-carrying barges mentioned later, the bulk of the traffic thus far has been in the smaller-sized sailing vessels.

The canal is now dredged to 20 ft.; it is 100 ft. wide at the bottom and 200 ft. wide at the top, the Buzzards Bay entrance having a width of 300 ft. There is perhaps no prejudice quite so strong as that of the average mariner, and the fact that the approaches are waters unknown to most of the vessel masters, especially those in boats drawing 15 ft. or more, is something it will take time to overcome. In other words, the canal will have to show a marked saving in time to induce owners to order their boats through and pay the 5½c. per cargo ton loaded and 4c. per cargo ton light, these being the present rates. The saving of distance is not great enough to make the canal route the obvious one under present conditions.

Among some of the shipping people there is a feeling that a favorable use of this route is dependent on tide, and that passage is often so delayed through adverse currents that the vessel might as well take its chance of rounding the Cape. Then, too, there is an opinion that vessels leaving the canal breakwater in Cape Cod Bay and later being caught by northeasterly winds have no harbor to run to and are too far inshore to be handled easily.

Sample opinions were expressed in the hearing given on Oct. 19 in Boston by Colonel Millis, of the United States Engineer Corps, on the proposal for a lane to be kept open through Vineyard and Nantucket Sounds. A representative of the Merchants and Miners Transportation Co., operating steamers between Boston, Norfolk and Baltimore, said that in fair weather his line did not care to use the canal and that in foggy weather it was hard to find it. Other captains and pilots said they saw no chance for the larger steamers and vessels using the canal to any extent until it was widened to 400 or 500 ft. and dredged still deeper than it is now.

There are some, however, who believe that even if the larger vessels do not go through, the number of towed barges will steadily increase and the outside route will be made that much less dangerous. Tugs and barges of the Lehigh Valley Transportation Co. tried the canal during the summer, but they have not as yet made it a practice. The fleet of the Pennsylvania Coal Co., freighting anthracite from the Erie and the New York, Susquehanna & Western, have used the canal quite consistently in recent months, but the number of boats is not large. If the Philadelphia & Reading Transportation Line, with its 12 tugs and 70-odd barges, should approve the new waterway, it would set the enterprise forward to a measurable extent.

The canal therefore is still in a development stage, and it cannot be said to have had any marked effect on the coastwise coal trade.

Work Wanted by Texas Miners

A reader of *Coal Age* states that down in Texas a large number of men are out of employment and are desirous of securing work in the coal mines of some other field. Anyone wishing to communicate with these miners should let us know.

Coal Age will be pleased to act as a clearing-house for men who wish employment or for mine owners who are short of labor. Tell us your wants.

The Union Yet to Be

The operator's trials with the union are largely due to a few unreasonable persons and some day to offset the work of these the operator will help to post notices on the buildings announcing union meetings. He may add an admonition of his own asking his men to go and vote their preferences. He will then try to make the union a reflection of the popular will and not the work of a clique, the scheme of unscrupulous plotters. Incidentally, too, it may be added, he will do less plotting himself and harmony will replace the present unfriendliness.

Sociological Department

First Aid or Prevention

First aid seems like an old familiar friend and needs no introduction. A friend indeed it has been to many a man who has traveled the rough road to the hospital. When we stop to think of the things which have been done by the Government, by the Red Cross and by industrial corporations, we realize how important it must be. Many lives have been saved by resuscitation methods alone, and many otherwise serious injuries have been rendered trivial by prompt attention. But with all its sterling qualities first aid is at best only a part of the pound of cure and must be so considered. We have pensions for the aged, burial benefits for the dead, insurance for the sick, first aid for the injured, but none of these things can be termed "prevention."—*H. S. Salmon.*

Indiana State First-Aid Meet

The rules of the Indiana State First-Aid Meet at Bicknell, Oct. 30, represent extended experience in the management of intercompany and open meets and contain much material which might well be copied elsewhere. Information regarding such rules is often requested, and for that reason they are printed here.

1. A team shall consist of a captain, four assistants and a patient. Teams may bring their own patients or upon request one will be furnished by the judges.

2. The captain may designate the member or members of the team by whom the event is to be performed.

3. The captain will control his team in its field work and stretcher drill, but only when the full team is engaged. The captain or other members must not prompt a person or persons performing the event unless he or they are participating in that particular event. In team events the captain may take actual part in the contest himself or merely direct the team.

4. The captain may take an actual part in bandaging in all events.

5. At the conclusion of any event the captain must raise his right hand and announce his team number. The team will remain at its post until relieved by the judge.

6. Teams must furnish all their own first-aid material, including bandages, splints, blankets, etc., and shall not be allowed to leave the patient in order to obtain material.

7. The triangular bandage shall be regarded as the standard in the contest, but roller bandages may be used, and equal credit will be given for their proper handling.

8. All splints must be prepared on the field during each event requiring their use.

9. No practicing will be allowed on the field before the beginning of the contest.

RULES BY WHICH JUDGES WERE GUIDED

10. The teams will be numbered consecutively, beginning at No. 1, and they must occupy the positions assigned to them on the field.

11. Judges will perform their work progressively. If there is a sufficient number of judges, judge No. 1 will judge team No. 1 in event No. 1; judge No. 1 will judge team No. 2 in event No. 2, etc. Where it is necessary to have each judge scrutinize two or more teams at a time, the same procedure will be followed as far as practicable. Judges will thus progress in each event to the team or teams of the next higher numerical designation, returning to the first team or teams when they have judged all the others. The judges will be selected by the committee on judging. The judge's decision regarding the time allowed for events and for removal of dressings should be communicated to team captains by the officials of the meet before the contest begins.

12. Each judge will be required to scrutinize the work done in each event and may call upon the captain or member who applied the dressing to explain his treatment.

13. An event embraces a problem which may call for the treatment of one or more injuries and the handling of the patient.

14. The events for the contest will not be announced until the teams are on the field and in their positions, each event being announced just prior to its performance.

15. Each judge will mark the team number, event and discounts for each team, sign his name and deliver the report to the chief judge after each event, who in turn will deliver these reports to the recorders to be checked. Suitable record cards for the use of the judges will be printed in advance and turned over to the chairman of the judges the day before the contest.

16. The recorders will add the discounts and mark the points made by each team in each event. The total points will be divided by the number of events, and the quotient will be the average for each team for the whole contest.

17. The points made in events performed to decide a tie shall not be included in the total points made in the whole contest.

18. Teams which make the highest average and tie score in events for which honors or prizes are offered shall precede all other teams having a lower score in the original events.

SCENE AT THE RECENT BICKNELL MEET

19. All ties shall be decided by special events.

20. Teams will not be discounted for slow work unless they exceed the alloted time or fail to give treatment promptly. All events will commence and be finished at the sounding of a gong or other audible signal, the meaning of which should be communicated to all team captains before the events commence.

21. Any standard style of stretcher may be used except where the event calls for an improvised litter.

22. The prizes will be listed by the committee on awards.

23. Donors of prizes will be required to advise the committee on awards of the manner in which their prizes shall be awarded, based upon these rules.

24. The judges have been instructed to discount a team 18 points for applying a dressing to the wrong limb or the wrong side of the body. The points will be made up as follows: Lack of attention, 2 points; not locating injury, 4 points; improper treatment, 12 points.

25. In events requiring artificial respiration a judge may require a team to perform the action separately if he is judging more than one team.

26. All splints and paddings used in the contest must be prepared during the event in which they are to be used.

27. Preceding all events it shall be the duty of the captain of each team to see that all triangular bandages are unfolded, as no folded triangulars will be permitted unless they have been folded during the event for which they are to be used.

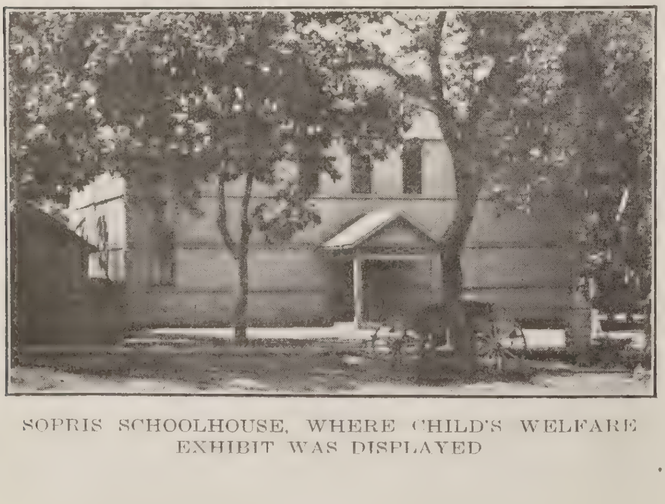
Public School Conference at Trinidad, Colo.*

The Public School Conference at Trinidad, Colo., was the outgrowth of a gathering at Sopris in the same state last April, at which a small group discussed matters pertaining to the public-school and related activities in Sopris and adjacent Colorado Fuel and Iron Co. camps.

It was decided at that time to arrange for a larger conference at Trinidad and to invite the coöperation of all interested in the public schools of Las Animas and Huerfano Counties. Much of the success of the conference was due to the presence and hearty support of Mrs. Mary C. C. Bradford, state superintendent of public instruction, and the county superintendents of these two counties. The work also of W. E. Bragg, representing the Colorado Fuel and Iron Co., was untiring and effective.

JOHN D. ROCKEFELLER, JR., AND MISS EDNA CAMPBELL'S SCHOLARS AT BERWIND

The registered attendance, not including many occasional visitors, was as follows: Teachers and directors from schools in Colorado Fuel and Iron camps (this includes every teacher in the schools in these camps), 61; from other schools in Las Animas and Huerfano Counties, 154; public-school officials and visitors, 21; total, 236.



SOPRIS SCHOOLHOUSE, WHERE CHILD'S WELFARE EXHIBIT WAS DISPLAYED

Among the prominent visitors and speakers from outside these counties, in addition to Mrs. Bradford, who aided the conference either by their presence or by also participating in the program, were: Mrs. J. F. Welborn and Mrs. J. A. Writer, of Denver; Mrs. W. C. Borst, of the Denver public schools; Miss Mary L. Oberlin, of the State Agricultural College; Dr. L. D. Osborn, of the University of Colorado; Prof. J. F. Keating, of Pueblo, and Prof. E. D. Randolph, of the State Teachers College.

On Thursday evening preceding the conference the visitors and speakers were the special guests of the Lincoln School of Sopris at a delightful dinner prepared and served by the domestic science pupils in the cottage recently erected by the company for the use of this department of the school.

On Friday evening the delegates were the guests of the company at a dinner served in the Trinidad Presbyterian Church.

Mrs. Bradford, state superintendent, in speaking of the camp schools and of this conference, says:

> The most remarkable educational work of its kind in Colorado is being carried on in the camp schools of Las Animas and Huerfano counties. The teaching force seems thoroughly alive to the most advanced present-day educational demands and is doing practical work which will fit the pupils for the duties of life and teach them good citizenship—a majority of them being children of foreign parents.
>
> Beginning with the tiny pupils in kindergarten, first-aid is taught through all the grades of the schools.
>
> The conference was not only the largest and most educational ever held in southern Colorado, but was unusual of its kind.
>
> At the Sopris camp a remarkable little community house has been erected by the Colorado Fuel and Iron Co. and rented to the public schools, and there is evident a strong desire on the part of the company to better the living conditions of all classes of employees.

A LINE-UP OF THE EDUCATORS AT THE TRINIDAD SCHOOL CONFERENCE

⁂

Quit Your Grumblin'

Quit your kickin', old man—it's not any use
To fight Mr. Trouble with jawbone abuse.
If you want to succeed, it's not any way
To go around kickin' and wastin' your day.
If you can't make the hill a-runnin' on high,
Just throw her in low, and never say die.
The first in the start may finish the last,
So keep on a pluggin'; don't hurry too fast.
Keep smilin'; don't worry; you'll make it all right
If you just keep a-tryin' with all of your might.
Don't waste your time kickin', but throw off your coat
And dig in and root like an Arkansaw shote.
If you think with old Fortune you have a rare pull,
You're kiddin' yourself with a poor line of bull.
If you want to make good, you'll have to go through
With a stiff course of trainin' before you will do.
So cut out your kickin' and turn off the bile
And jump in and work, with a song and a smile.

⁂

The United Mine Workers Will Hold at Des Moines, Iowa, a first-aid meet from all parts of subdistrict No. 3, District 13. J. J. Forbes, representative of the United States Bureau of Mines, is supporting the movement. The meeting will be held in the Des Moines Coliseum, and 40 teams of six men each will compete, some of whom have been active in first-aid work for four years. Several labor leaders will probably attend.

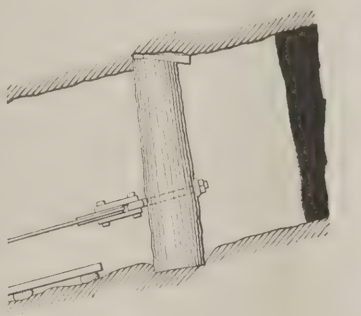
Discussion by Readers

Handling Cars on Pitches

Letter No. 2—Replying to Mine Superintendent's request for a practical method of handling cars in rooms where the grade is too steep to enable them to be safely handled by hand, permit me to say that the method as described in *Coal Age,* Oct. 23, p. 687, in answer to this inquiry, can be worked successfully. I may say that there is no such thing as failure in this system if the grade is sufficient to overcome the friction of the moving cars. My experience of 20 years in the operation of such inclines enables me to say that where economy is a chief factor this system meets every requirement.

As has been suggested it is always possible to lessen the grade by driving the rooms across the pitch or at an angle with the level. This also widens the range of application of the different methods of handling cars in pitching seams.

The double-track, self-acting incline, owing to its simplicity, is a great convenience to miners when working on pitches where it can be used. The system is well understood and needs little explanation further than that already given. Every miner knows how to set an 8-in. or 10-in. post at the head of an incline so as to hold the load. There are, however, different methods of attaching the sheave wheel to the post. I have been accustomed to use a long bolt that is passed through a hole bored in the post about a foot above the level of the rails, as shown in the accompanying sketch. The end of the bolt is threaded for a nut, and a heavy washer is used under the nut so as to give a better bearing against the back of the post.



SHOWING POST SET AT HEAD OF ROAD TO HOLD SHEAVE

A chain is often used in preference to the wire rope, for the reason that the strands of the rope are apt to be broken by passing over a small sheave. Besides, if the chain is broken, it is more easily and quickly repaired than a rope, which must be spliced—an operation not always understood by miners.

The double-track system has one disadvantage. It necessitates keeping a larger number of cars in use, since there must always be one empty car and one loaded car in each room. To overcome this difficulty, a small heavy iron truck called a "barney" is sometimes employed. This consists of an iron casting 3 in. thick and about 3½ ft. long mounted on small wheels. This barney takes the place of an empty car when lowering the loaded car from the face of the room to the entry. The barney may be operated on another track at the side of the loaded track, but it is sometimes made to run on light rails laid between those of the main track. In this arrangement the barney passes under the cars as they descend or ascend the incline. The weight of the barney must be such that it will partly counterbalance the weight of the loaded car and at the same time be sufficiently heavy to pull the empty car up the incline. The weight of the barney is regulated by extra iron plates that can be laid on top of the iron base, to which they are secured by bolts.

Another modification of this system that I have seen employed with success uses but a single track. In this case, the loaded car is well spragged so as to control its descent on the incline. When the two cars have come nearly together, the loaded car descending and the empty car ascending the incline, they are stopped. A timber is thrown across the track so as to hold the loaded car. The empty car is then turned up at the side of the track and the loaded car carefully lowered past it, when the empty is replaced on the track above the loaded car. The rope is now again coupled to the cars, after which the load is lowered to the entry.

I have seen all of these methods employed under varying conditions, and will say that Mine Superintendent need have no hesitancy in adopting one of them. The convenience of the system will quickly repay the slight expense of its installation. There should always be some attachment provided at the foot of the incline to hold the rope or chain when this is unhooked from the loaded car.

THOS. MULHOLLAND.

Ensley, Ala.

The Effect of Storage on the Analysis of Coal

In further discussion of the question, asked by R. T. M., *Coal Age,* Aug. 14, p. 271, I beg to add a few words to the explanation offered by Percy N. Coupland.

Mr. Coupland, in answering this question, writes that "the extent of deterioration in the coal would be determined by the percentage of loss in heat value." It is fully agreed that a calorific determination made on coal when first put in storage and again when removed from storage would show the loss in heat value for that period, but it is hardly correct to assume that this one and only determination would show the total loss and impairment sustained by storage.

When deterioration takes place in coal, it not only affects the chemical constituents but likewise the physical and coking qualities of the coal. In order to accurately determine the extent of deterioration an ultimate organic analysis must be made, by which is determined the percentage content of hydrogen, carbon, nitrogen and oxygen by difference. To ascertain the loss of byproducts and impairment of coking qualities, diminutive laboratory carbonization tests are required. Some coals that are easily susceptible to oxidation in storage show noticeable changes in the composition of the volatile matter even in six months' time, as for instance, a loss of ammonia and tar and a fluctuation in the percentages of carbon dioxide and hydrogen sulphide.

The composition of the gas evolved from weathered coal has been shown to differ from that of fresh coal in that there is an increase in the percentages of hydrogen and carbon monoxide and a decrease in the percentages of methane and illuminants, which give a resulting gas of lower B.t.u. value per cubic foot of gas.

To certify to the extent of deterioration of coal during storage, in the full sense of the word, involves more work than the singular determination of calorific value. While it is the general opinion that it is not necessary to conduct elaborate tests as mentioned for the ordinary consumer of coal, yet the results of such tests are essential and prove of operating importance where weathered coal is coked in the modern byproduct coke ovens and where its every quality and constituent has a definite value and purpose.

Joliet, Ill. BYKEM.

⁂

Responsibility of Miners

Letter No. 3—Referring to the letter of C. W. Rotenberry, *Coal Age*, Sept. 18, p. 472, I note that he mentions briefly the rapid growth of the safety-first movement and the great favor that it has met among mine officials and operators in recent years, resulting in the reduction of accidents and the saving of many lives. The writer of the letter censures the newspaper press for the attitude it has assumed, claiming that it educates the miner to believe that "companies are directly and wholly responsible for the safety of their employees in the mine."

INCREASED SAFETY IN MINES TODAY

Mr. Rotenberry then refers to the "great advance" that mine officials have made in the direction of safety. It is true that mine officials as a class have made rapid advancement in many things pertaining to safety in mining during recent years. Two principal reasons can be assigned for this result:

First, the requirement of many state mining laws that mine foremen must hold certificates of competency before being permitted to assume the duties and responsibilities of such a position is being better enforced now than formerly. In many instances the applicants for these certificates are obliged to pass rigid examinations on practical questions pertaining to safety in the operation of mines, and the standard of these examinations has been gradually raised so as to attain a higher degree of efficiency among successful candidates.

Second, operators today are seeking mine officials who are proficient in safety measures and can intelligently instruct their men in what is required. In order to enforce safety measures, a mine official must practice them himself. Mine foremen are coming to realize that this is one of the chief requirements of their position.

FORMER PRACTICE IN TESTING FOR GAS

As an illustration I shall cite an incident in my own experience. A little more than 30 years ago I was digging coal in a place where no gas had been found previously. When I went into my room one morning, the open light I carried ignited some gas that had accumulated the night before at the face of the room. Although I was not seriously burned, the flame having passed over my head, I went out of the mine and did not work that day. On returning to work the next morning, the boss told me to lower the flame of my light on going into the room and to raise it carefully toward the roof to see whether there was any gas there. Not knowing any better, I followed his instructions, but fortunately for me no gas had accumulated that morning. What would be said of a mine foreman giving such instructions to a miner today?

REQUIREMENTS RELATING TO MINERS

Again, speaking of safety Mr. Rotenberry says, "Miners, as a class, have retrograded along this line." While miners may not have advanced as rapidly as mine officials in respect to safety, I do not think they have retrograded. The responsibility for their slow progress in this direction rests with the mining laws, which do not require a fixed standard of competency on the part of the miner. At least this is the case in the majority of coal-mining states. In former years a miner was required to serve as helper for several months, working with an experienced miner before he was permitted to mine coal alone. With few exceptions, there is no such requirement of miners today, but men fresh from the farm and the factory, without any training or previous experience in mining, are permitted to enter the mine and dig coal. It is clear that these men are unable to protect themselves properly while at work in the mines.

I have observed a growing tendency in some mining sections to relieve miners of any personal responsibility for their own safety, supplementing the responsibility of the miner by the efficiency of the foreman and other safety officials. This is too great a responsibility to be shouldered by the foreman. The personal responsibility of the miner cannot be shifted to the shoulders of a foreman, however efficient the latter may be. When a miner realizes his own responsibility, he becomes more prudent and careful in his work.

I do not know that miners are more reckless and careless than other workmen, as is often charged, but it is a fact that many miners assume unnecessary risks. No doubt many accidents result from this cause, while the responsibility for their occurrence is charged to the inefficiency of the foreman. It must be admitted that miners, for the most part, possess the necessary knowledge of what is required to safeguard themselves, but they are prone to wait for the mine foreman or another mine official to instruct them before taking the precautions they know to be necessary.

SHORT HOURS TEND TO CARELESSNESS

I believe it was Savonarola who said, "One only knows what he practices." A knowledge of any calling is of little or no value if not practiced or judiciously employed as occasion may require. For instance, an experienced miner who carelessly works under a loose piece of slate is as likely to be killed as the laborer who has no knowledge of the impending danger. Therefore it is not so much what a man knows as what he practices.

I agree with the suggestion that the shortening of the hours in which a miner must perform his work has a tendency to make him careless. It may be added that a reduction in the price paid for mining has the same tendency, as the miner must load more coal in less time in order to make the same amount of money as formerly. As a consequence, he neglects setting the necessary timber to protect himself while at work.

JOHN ROSE,

Dayton, Tenn. Former District Mine Inspector.

Store Checks vs. Thrift

Letter No. 7—I have been reading the letters published in *Coal Age* on the subject of "Store Checks vs. Thrift," and in one instance only (Letter No. 4, page 863) has it been plainly shown that thrift is a characteristic virtue inherent in the individual and one that should not be influenced either favorably or unfavorably by the accident of environment.

An individual who has developed this virtue with respect to financial matters has learned several important lessons in economy. He has acquired a certain amount of control over indiscreet tendencies and trained his mental faculties in the most important of their operations—thought. He has learned that his wages are an interest or dividend paid on his invested capital; that labor is the only way by which his present strength and skill can be converted into a tangible means of support in later years when his earning capacities are on the decline and become less remunerative. He has acquired the power to deny the gratification of his selfish desires and trained his thoughts and directed his energies to securing the material welfare of himself and those dependent upon him.

It is to be regretted that this virtue is not characteristic of the coal miner. It may seem harsh to say that a large percentage of coal miners are naturally selfish. As a class they are commonly considered to be large-hearted, sympathetic and generous, and they certainly do possess these qualities in a large degree. But it is the free exercise of these attributes without due thought of the future that is productive of selfishness. When a man spends his wages without proper regard to the material welfare of his family, he is gratifying a selfish wish or desire, whether it be participated in by the whole household or not.

A Thrifty Man May Always Be in Debt

The exercise of thrift does not necessarily result in the accumulation of wealth, neither is the thrifty man always free from debt. Circumstances may be such that the earnings may not be adequate to meet the necessary expenditures; but any saving is always the evidence of thrift if it accomplishes no more than the reduction of a debt. It has been candidly admitted by employers that efficiency is the best recommendation of an employee and that a thrifty man is generally an efficient workman. It seems a natural conclusion, therefore, that it would be good policy on the part of all employers, especially those in the coal-mining industry, to afford their employees every possible advantage for the exercise of this virtue.

The abolishment of the store-check system or any other form of commercial transaction relating to the commissariat of a mining camp will not tend to develop the quality of thrift among the miners. On the other hand, the manner in which such stores are conducted may make a thrifty miner dissatisfied and result in his seeking another field where he will have an opportunity of saving a portion of his wages by the exercise of thrift, even though his earnings may be less.

A Scheme to Outwit the Company

The manner in which company stores are often conducted affords many opportunities for the display of thriftlessness. The man who is constantly in debt at the store cannot always be regarded as a thriftless man, however. I have known instances in which the policy of keeping in debt at the store was pursued not merely as a scheme to secure steady employment, but as a means of banking savings. The scheme works as follows: A married man boards, as members of his own family and not as boarders, from four to eight employees of the mine where he works. He is generally a steady worker, but it requires more than his earnings to meet the monthly or semi-monthly store bills, and each succeeding month adds to his indebtedness at the store. Now, to help this good customer out, the store manager applies to the mine management and the delinquent is given steady work in the most remunerative place in the mine.

In the meantime, this man collects the board of his lodgers and banks it, making no effort to discharge his indebtedness at the store. Let me ask, Who is the goat in this case? Is it not a true business maxim that the man who meets his indebtedness promptly pays for the deficiency caused by the man who does not? Then, the thrifty, honest man must not only bear the burden of the business profits, but the losses as well. The instance I have cited will no doubt be pronounced by store managers and others as dishonest, and so it is. But is it any more dishonest than for the manager to make up his losses by increasing the prices of the goods he sells? Commissariat stores doing business on such a principle are not a menace to thrift, but are cultivators of dishonesty.

Discounting Store Checks

I have never had experience in camps where the discounting of store checks and their subsequent redemption in legal currency has been practiced, but it appears to me that any management that would tolerate such methods would be guilty not only of degrading the habits of the miners, but affording means for sharp practices on the part of speculators.

I have had experience, however, in camps where store checks were used only in exchange for goods at the commissariat, and this certainly cannot be regarded as an indication of a lack of thrift, but on the contrary it is an exhibition of good business sense. Even supposing I can discount a $10 store check at 20 per cent. and invest the $8 in cash at a store where I can secure a value in the necessaries of life equal to what I could purchase at the commissariat for $11 in script, I am then saving $1 in cash. Instances of this kind can be substantiated. They are good examples of thrift and business policy. The loser in this case is the man who discounts the check, for it is redeemable only at the commissariat at the prevailing prices.

The prevalence of high prices and dilatory if not discourteous service are not the only features that are objectionable at company stores. There is often a compulsive feature that is even more objectionable than those mentioned. A miner is not told outright, in so many words, that the continuance of his job will depend on his dealing exclusively at the store, but this is intimated in terms that even the dullest intellect can comprehend. Nothing detracts so much from a man's self-esteem and his natural manhood as to know that his actions are controlled by compulsory methods. Circumstances may compel him to submit, but it will be under protest, and he will seize the first opportunity to "get even."

If commissaries were conducted along the lines suggested in Letter No. 4, the quality of thrift would not be developed, but it would have a broader field and a freer scope for its exercise, to the financial betterment of all parties, while improvidence and recklessness would be restrained and curtailed. A. M. Iner.

——, Penn.

A Flooded Mine Proposition

Letter No. 3—Referring to the inquiry, *Coal Age*, Oct. 16, p. 646, on this subject and the suggestion following Letter No. 2, on the same subject, page 854 of the issue of Nov. 20, in regard to keeping boreholes a considerable distance in advance of the working faces, I desire to submit a rule adopted by the Tennessee Coal, Iron and Railroad Co. to prevent such occurrences, which is as follows: "When it is known that a place is likely to obtain a dangerous accumulation of gas or water, workings approaching such places shall not exceed 8 ft. in width, and the person or persons driving such places shall constantly keep at a sufficient distance ahead, not less than 20 ft. in advance, one borehole near the center of the working and one at each corner 20 ft. deep, at an angle of 45 deg., at intervals of 6 ft. These holes shall not be used for blasting, but separate holes for blasting, not over 4 ft. deep, must be drilled. These precautions must begin at least 100 ft. from the probable source of danger."

The reason for beginning these precautions so far from the probable source of danger is to allow for possible error in old surveys which cannot be checked or for the possibility of old maps not showing the final extraction of coal from the abandoned area. When the accuracy of the surveys and maps is assured, this distance can be lessened, but safety of operation must always be the first consideration.

In order to control the flow through one of these boreholes in case water or gas under pressure is encountered, the near end of the hole can be kept reamed out and a piece of pipe with a gate valve inserted and packed and braced so that the pressure cannot force it out when the valve is closed, and so as to prevent leakage around it, the pipe and valve being of sufficient size to allow the drill to easily pass inside of it. For instance, if a 1½-in. drill is used, after each shot is taken, the near end of the hole can be reamed out to make a tight fit for a 2-in. pipe, which can be inserted with a gate valve of the same size and the hole extended by drilling through the valve and pipe.

If desired, the water can be drained from the flooded workings through this valve, as it can be handled. When the water is tapped, a larger hole and pipe or several of them can be used if it is desired to drain the flooded workings more rapidly. Edw. H. Coxe.

The conversion factors in these tables have been derived independently from the following standards:

1 meter (U. S.) = 39.37 in. (1 in. = 25.4 mm.);
1 sq. meter = $39.37^2 \div 144$ = 10.76386736 sq.ft.;
1 cu. meter = $39.37^3 \div 1728$ = 35.31445447 cu.ft.;
1 liter = 61.02338189 cu.in.;
1 U. S. (Winchester) bushel = 2150.4 cu.in.;
1 British (imperial) bushel = 2218.192 cu.in.

Inquiries of General Interest

Flow of Water in Pipe Line

Referring to the inquiry, *Coal Age*, Nov. 6, p. 773, I want to draw attention to an evident error in the answer given to the question asked, in respect to the change of head or pressure owing to the gradual contraction and enlargement again of the sectional area of the pipe. The answer gives the pressure at the contracted area as 256 times the pressure in the main pipe, which is evidently at variance with the well-known principle of hydraulics that should apply in this case where pressure head is converted into velocity head.

My figures show that, ignoring friction, there is a loss of 99.1 ft. in pressure head, owing to the contraction in the sectional area of the pipe and consequent increase in the velocity of the water. I estimate that this will be the difference in head up to the point where a vacuum occurs at the throat, when the carrying capacity of the pipe will begin to be reduced. In other words, the pipe will run full, in the case assumed, under any head not less than 99.1 ft. minus the head corresponding to the atmospheric pressure, which at sea level is practically 34 ft. This would make the limiting head in the main pipe, for full capacity, 99.1 — 34 = say 65 ft., and any less pressure would not maintain the full capacity of this pipe. I would like to see this question treated again in full.

T. R. HAYTON.

Appleton, Wis.

We thank correspondent for drawing attention to this oversight, which is quite apparent in the last paragraph of the previous answer in respect to the change of pressure head due to the contraction of the area of the pipe. In this case, owing to the gradual contraction and enlargement of the sectional area of the pipe, ignoring friction, the pressure head is converted into velocity head as the area reduces and is again changed into pressure head as the area enlarges.

The first step is to estimate the change in velocity due to the change in sectional area. For the same flow of water, the velocity varies inversely as the sectional area of the pipe. In other words, the velocity ratio is equal to the inverse area ratio, or the square of the inverse diameter ratio. Calling the original velocity and diameter v_1 and d_1 and the velocity and diameter at the throat v_2 and d_2 respectively, we have

$$\frac{v_2}{v_1} = \left(\frac{d_1}{d_2}\right)^2$$

Then, substituting the given values in this formula, the velocity at the throat is

$$v_2 = 5\left(\tfrac{12}{3}\right)^2 = 5 \times 4^2 = 80 \textit{ ft. per sec.}$$

The old Bernouilli theory, relating to the flow of fluids in conduits, makes the sum of the pressure head, velocity head and gravity head a constant throughout the length of the pipe line. The pipe line in this case being horizontal, the gravity head is zero and the sum of the pressure head and velocity head is constant at any point in the pipe. Hence, calling the pressure in the main pipe h_1 and that at the throat h_2, we have

$$h_1 + \frac{v_1^2}{2g} = h_2 + \frac{v_2^2}{2g}$$

and

$$h_1 - h_2 = \frac{1}{2g}(v_2^2 - v_1^2) = \frac{80^2 - 5^2}{64.32} = 99.1 \textit{ ft.}$$

This shows, as our correspondent has stated, that the loss in pressure head due to the contraction of the area is 99.1 ft., under the assumed conditions. Also, it is clear that this loss in pressure head holds true for these velocities, irrespective of the head in the main pipe, which can be reduced to 99.1 — 14.7 ÷ 0.434 = 65.3 ft., at sea level, before a vacuum will form at the throat and reduce the capacity of the pipe.

⁂

Problem in Mathematics

Will you kindly show the correct solution of the following problem: An army of soldiers in single file is 50 mi. long. Assuming that the soldiers, marching continuously, go 50 mi. in 10 hr., if an officer starts at the same time from the rear of the column and walks the entire length of the line to its head and then turns and walks back and reaches the rear of the column in the same time that the soldiers complete their march of 50 mi., how far has the officer walked in the 10 hr.? I am told that the correct answer to this example is 120.6 mi.

Roanoke, Ill. PAUL CERAR.

Assume the officer walks at the rate of x mi. per hr. The soldiers march at the rate of 50 ÷ 10 = 5 mi. per hr. Therefore, the officer gains on the soldiers $(x - 5)$ mi. per hr., and he will gain the length of the column, or 50 mi., in as many hours as $x - 5$ is contained in 50.

When walking back toward the rear of the column, while the officer is walking x mi. toward a soldier, that soldier is walking 5 mi. toward the officer, which makes the total ground covered, or the distance the officer has approached the rear of the column, as measured along the column, $(x + 5)$ mi. in 1 hr. At this rate the time, in hours, required for the officer to reach the rear of the column and complete his task will be found by dividing the length of the column (50 mi.) by $x + 5$, the gain per hour. This must then be added to the time the officer took to reach the head of the column.

Since the total time of marching is 10 hr., we write the equation

$$\frac{50}{x - 5} + \frac{50}{x + 5} = 10$$

$$5(x + 5) + 5(x - 5) = (x + 5)(x - 5)$$

$$x^2 - 10x = 25$$

$$x = 12.07 \textit{ mi. per hr.}$$

The distance the officer has walked in 10 hr. is therefore 10 × 12.07 = 120.7 mi.

Examination Questions

Miscellaneous Questions

(Answered by Request)

Ques.—(a) What are permissible explosives? (b) What conditions make their use necessary in a mine? (c) Why are they safer than black powder?

Ans.—(a) A permissible explosive is defined by the Bureau of Mines, in its Miners' Circular No. 2, page 5, as being an explosive that "is similar in all respects to the sample that passed certain tests by the National Bureau of Mines and when used in accordance with the conditions prescribed by that bureau."

The same bulletin, page 6, explains: "An explosive named in the permissible list if kept in a moist place until it undergoes a change in character is no longer to be considered a permissible explosive. If used in a frozen or half-frozen condition, it is not when so used a permissible explosive. If used in excess of the quantity specified (1.5 lb.) it is not when so used a permissible explosive. And when the other conditions have been met, it is not a permissible explosive if fired with a detonator of less than the prescribed strength."

The Bureau of Mines also reserves the right to withdraw from the list of permissible explosives any explosive previously listed as such, which then ceases to be a permissible explosive.

(b) The presence of a dangerous quantity of gas or dust in the mine workings makes the use of permissible explosives advisable if not absolutely necessary in order to prevent accidents common to the use of black powder for blasting coal. By order of the Secretary of the Interior, the use of permissible explosives is made compulsory in the coal mines of the Indian Lands of Oklahoma.

(c) Permissible explosives are generally safer than black powder in the blasting of coal because they produce less flame in their explosion and the conditions under which they must be used, as prescribed by the Bureau of Mines, have the effect of reducing to a minimum the risks of blasting coal in gaseous and dusty mines.

Ques.—What is the capacity of a double-acting pump, when the plunger is 20 in. in diameter and has a 40-in. stroke, the pump running at 25 r.p.m.?

Ans.—The piston speed of this pump is

$$S = \tfrac{40}{12}(2 \times 25) = \tfrac{500}{3}\ \textit{ft. per min.}$$

The capacity of a pump (G), in gallons per minute, for an efficiency (E), a piston speed (S), in feet per minute and a diameter (d), in inches, is given by the formula

$$G = 0.0408\ E\ S\ d^2$$

Now, assuming an efficiency of $E = 85$ per cent. and substituting the given values in this formula, we find for the capacity of this pump

$$G = 0.0408 \times 0.85 \times \tfrac{500}{3} \times 12^2 = 2{,}312\ \textit{gal. per min.}$$

Ques.—If a fan is circulating 57,000 cu.ft. of air per minute, with the expenditure of 39 hp., what horsepower will be required to increase this circulation to 87,000 cu.ft. per min.?

Ans.—Assuming there is no change in the mine airways, the horsepower producing the circulation varies as the cube of the volume of air produced. In other words, the power ratio is equal to the cube of the quantity ratio, which gives here

$$\frac{H}{39} = \left(\frac{87{,}000}{57{,}000}\right)^3 = \left(\frac{87}{57}\right)^3 = 3.56,\ \textit{nearly}$$

$$H = 39 \times 3.56 = 138+\ \textit{hp.}$$

Ques.—A fan running at a speed of 60 r.p.m. produces a water gage of 2 in. (a) If the speed of this fan is increased to 90 r.p.m., what pressure will be produced? (b) If the quantity of air in circulation at this increased speed of the fan is 100,000 cu.ft. per min., what is the horsepower on the air?

Ans.—(a) For the same mine or airway, the quantity of air in circulation varies as the fifth root of the fourth power of the speed. In other words, the quantity ratio is equal to the fifth root of the fourth power of the speed ratio, which makes the quantity ratio in this case

$$\frac{Q_2}{Q_1} = \sqrt[5]{\left(\frac{90}{60}\right)^4} = \sqrt[5]{\left(\frac{3}{2}\right)^4} = \sqrt[5]{1.5^4} = 1.383$$

Then, since the pressure in any circulation varies as the square of the quantity of air passing, the pressure ratio is equal to the square of the quantity ratio, or in this case $1.383^2 = 1.9$, and the pressure due to the increased speed of the fan is therefore

$$p = 5.2(2 \times 1.9) = 19.8\ \textit{lb. per sq.ft.}$$

(b) The horsepower on the air is then

$$H = \frac{Qp}{33{,}000} = \frac{100{,}000 \times 19.8}{33{,}000} = 60\ \textit{hp.}$$

Ques.—In a gaseous mine where 160 persons are employed, would you consider the ventilation sufficient, providing the quantity of air in circulation is equal to 150 cu.ft. per min. per man?

Ans.—This volume of air in circulation may meet the requirements of the mining law in the state where the mine is located; but owing to certain physical conditions in the mine, such as a large opening, great thickness of seam, frequent large gas feeders or sudden emission of gas from the roof in large quantities or the presence of much fine dust of a highly inflammable coal, this volume of air may prove wholly inadequate for the safe working of the mine.

Ques.—How much oxygen will be required for the complete combustion of 100 cu.ft. of marsh gas?

Ans.—First write the chemical equation expressing the reaction that takes place when marsh gas (CH_4) is burned in oxygen (O); thus,

$$CH_4 + 2\ O_2 = CO_2 + 2\ H_2O$$

This equation shows that each molecule of marsh gas consumes two molecules of oxygen, and as these gaseous molecules are of equal size, it follows that 100 cu.ft. of marsh gas will consume 200 cu.ft. of oxygen.

Coal and Coke News

Washington D. C.

Further and decided improvement in coal-mining conditions is portrayed in the reports of the business situation sent to the Federal Reserve Board by agents of that body and published in the Federal Reserve Bulletin for Dec. 1.

From the Pennsylvania district it is reported that there is "a decided improvement in coal mining, many collieries working to capacity. Shippers, however, are confronted with a shortage of cars which is likely to check the output to some extent. Crude oil and oil refining are operating at full time, with a good demand and increasing prices. Considerable foreign business is being done. The Delaware River shipyards are busier than ever."

From Cleveland the report comes that "the coal trade shows little change over last month, except a tendency to further improvement through the activity and advance in other lines."

Richmond writes that "some coal concerns are now doing the largest business in their history. At some points there is car shortage. Mines are working at full capacity and some concerns have ceased giving out quotations on spot product. While a heavy export demand continues, the consumption for domestic purposes is greatly increased. Prospects for the future are better than fair, operators fearing only the possible handicap of shortage in labor."

From Kansas City it is stated that "the oil industry is more active than it has been at any time during the present year."

HARRISBURG, PENN.

Regulations with which the employers of Pennsylvania must comply if they desire to carry their own workmen's compensation liability insurance are being prepared by the Compensation Board.

A number of big corporations, such as coal, railroad, steel and other companies, are asking upon what terms they may secure exemption from the necessity of insuring either in the state fund or in stock insurance companies against payment of compensation, and the terms set out will permit them to carry their own insurance subject to the approval of the board. It is also required that when the board directs payments must be made to a bank or even securities deposited with the state fund so that workmen may be protected.

The data to be furnished to the Compensation Board are similar to that furnished for state taxation, and are to be held confidential. Location, kind of employment, average number of employees and estimated payroll are required with a statement of assets and liabilities, together with a statement of capital, value of patents, trademarks, good will and property, as well as a statement for three years of sales, expenses, payroll and profits. Special inquiry is made as to debt, safety, welfare and sanitation conditions, whether Department of Labor requirements are met, kinds of inspection, whether there is a safety committee and a hospital, together with data on past accident experience.

The applicant must accept the schedule of payments for compensation and must agree to deposit money required to meet compensation awards or must file money or securities or a bond equal to a year's premium. Where there is a subsidiary company the parent company may be required to give a guarantee of payment.

The board will reserve the right to make further inquiry as to financial standing at any time and to act accordingly.

Reduction in Railroad Rates Postponed

Reductions in anthracite coal rates ordered by the Interstate Commerce Commission, to become effective Dec. 1, were postponed on Nov. 23, until January 1.

This is the second postponement. The original orders were to become effective Oct. 1, but on a showing by the railroads that the new tariffs required to be filed were complicated, a first extension of 60 days was granted.

A few weeks ago coal operators in the Wyoming region asked a rehearing in relation to the proposed rates on the smaller sizes of anthracite, alleging that the new orders were unjust when the rates were compared with those of the large sizes. There have been reports that the railroads might seek to overturn the decision through court proceedings, but so far there has been no evidence before the commission of such an intent. The new rates apply between the Pennsylvania mines and the Atlantic seaboard.

The Interstate Commission on Aug. 12 gave a decision reducing railroad rates on anthracite coal from the producing districts in this state to tidewater points of 10c. a ton, and to certain points 15c.

The decision was the result of an investigation made pursuant to an order by the commission on June 10, 1912. It was the finding that rates are unreasonable, because they yield too great a profit over operating cost in the traffic.

In the case of the coal traffic of the Central R.R. of New Jersey it was found that the weighted average cost a short ton-mile was 3.3 mills, while the average revenue a ton-mile was 9.45 mills and on the long tons 10.59 mills. This comparison was held to be typical of the majority of the roads concerned.

In most cases the carriers were declared to be making over 200 per cent. on the traffic and in many cases much more. For a number of the smaller roads less favorably situated the decision, it was figured, meant a decided loss. It was estimated by experts that the total reduction of coal-road revenues would be fully $8,000,000.

PENNSYLVANIA

Anthracite

Scranton—The Carney & Brown Coal Co.'s breaker on the outskirts of the city was totally destroyed by fire at 5 o'clock on the afternoon of Nov. 26, with a loss of $50,000. The breaker had a production of 500 tons of coal per day and employed about 200 men and boys. The origin of the fire is unknown.

Shamokin—The collieries in this district have been badly handicapped by the lack of empty cars. The Philadelphia & Reading Ry. Co. is doing everything possible to deliver the equipment to the mines but despite its efforts a number of collieries have recently been compelled to close down. The railway company is also experiencing some difficulty in moving the loaded cars destined to points east and south.

Centralia—Two miners were entombed on Nov. 27, in Packer No. 5 colliery of the Lehigh Valley Coal Co. by an explosion of gas. The dead bodies of both men were found by rescuers in the gangway 1,500 yards from the scene of the explosion which did great damage and forced a suspension of all work in the colliery. The men who were working in other sections of the mine were hoisted to the surface in safety. The first level of the mine took fire for nearly 1,000 yd. Nearly all the leading mine officials and state mine inspectors of this region were on the scene with fire fighting apparatus and the company is stopping at no expense to conquer the flames.

Buck Mountain—A half century and more ago the mine of the Lehigh Valley Coal Co. here was supposed to have been worked out. However the company has relocated a coal bed and is now conducting large stripping operations and it is announced that the coal will last many years. As a result the village which was practically abandoned has taken on new life and the erection of 40 houses has been ordered by the company. The company will also spend about a million dollars in the building of a tunnel to drain the mine, work on which has already started.

Tamaqua—In preparation for the provision of the Compensation Law effective Jan. 1, 1916, the smaller anthracite companies are having insurance companies examine their mines with a view to taking over the insurance of their pay rolls. Some of the smaller companies who have but few employees and a limited income will retire from business at the close of this year.

Car shortage caused a curtailment of production during the past week, and despite the efforts of the railroads there is no apparent cause to expect better conditions for some time. The much-heralded shortage of labor in and about the mines is confined solely to laborers, aside from this class of help the usual number of applicants for mining positions can be found at the collieries. The nearby powder and munitions plants are taking some of the men but in many cases these men find conditions too burdensome, and are either discharged quickly or return to the mines voluntarily.

Hazleton—For two years the Mineral Spring colliery of the Lehigh Valley Coal Co. has been awarded the banner for having the neatest appearance around its outside workings. Five years ago when the company offered a banner to the men making the best showing this colliery stood 17th. It was ranked No. 9 the next year, following this with No. 3, until in 1913 it took first place and has held it ever since, although this year it only won by $\frac{7}{10}$ of a point. As indicative of the men's interest in the contest they have surrounded the breaker with a green lawn and flower beds and often in the summer time they are to be seen after working hours and on Sundays watering the grass and flowers.

Mt. Carmel—After years of litigation the borough of Mt. Carmel has forced an agreement with the coal companies under which the latter will provide a sewer outlet since the natural waterways have been blocked by coal dirt. It will require a considerable expenditure by the coal companies to open the proposed channel.

Bituminous

Connellsville—The Connellsville coke region is sorely in need of men to operate the coke ovens properly. The region is at present running 81 per cent. capacity and 94 per cent. efficient, that is the 31,700 active ovens capable of producing 460,000 tons of coke per week are turning out only about 433,000 tons. This condition has prevailed for some time and cannot be remedied until more men are secured.

Latrobe—The old Duquesne plant of the Bradenville Coal and Coke Co. is being made ready for firing. This plant comprises 150 ovens and has been idle for several years during which time raw coal has been shipped from the mines. With new equipment installed throughout the plant is in good condition to take advantage of the favorable market for coke, and the firing of the ovens will be undertaken at once.

Indiana—It is stated that 3,000 additional men are needed in the Indiana County coal field. The coke ovens at the Ernest operations were recently fired for the first time in two years.

Uniontown—The Bird Coal Co. is making extensive improvements at its plant near Kelso.

WEST VIRGINIA

Charleston—Earl Henry, chief of the Department of Mines, recently announced that 16 men had been awarded first-class certificates from among more than 100 who recently took examinations here to become mine foreman. One man, George F. Carbough, of Carlisle, passed as a fireboss.

Boomer—Nineteen men are reported killed and 11 more are unaccounted for as the result of an explosion in the No. 2 mine of the Boomer Coal and Coke Co. on Nov. 30. Thirty miners were brought to the surface alive, and at last accounts hopes were entertained that more men might be rescued.

ALABAMA

Birmingham—The car shortage, while not acute, is being felt by the shippers, and fear is expressed that December and January will bring about a serious shortage of equipment. The railroads are endeavoring to prepare themselves for any such emergency and are bending every effort to avoid such a condition.

The Tennessee Coal, Iron and R.R. Co., in the Birmingham, Ala., district, is discontinuing the payment of machine men for coal cutting in the coal mines on a tonnage basis and is paying them by the day, the scale fixed for machine runners being $3.75 per day. It is thought that some of the other coal companies in the district will follow the same plan.

KENTUCKY

Seco—The South East Coal Co.'s initial shipments now going out are destined to Detroit for distribution to the Great Lake trade. Much of the product of the South East mines will go to the markets of the North and Northwest, as well as the Great Lake trade.

Fleming—It is said that the consolidation of the Elk Horn Mining Corporation and the Elk Horn Fuel Co. into the Elk Horn Coal Corporation with something over $28,000,000 capital will mean greater things in the development of coal land holdings in the eastern Kentucky field. The company owns a boundary of 200,000 acres lying in Letcher, Pike, Knott, Floyd and Magoffin counties. At present this company is putting out at the rate of 1,500,000 tons annually. Within the next few months the company will be putting out coal at the rate of 3,000,000 tons annually.

Whitesburg—The South East Coal Co. has begun operations on a lively scale between Fleming and Kona on Boone's Fork.

According to Perry County operators the production of that field will be doubled by the first of the year. The First Creek Coal Co., the Harvey Coal Co. and the Kentucky Block Coal Co. are three new companies which will be responsible for the increase.

Hazard—Preparations are being made to increase the output of the old North Fork Coal Co.'s operation, bought recently by the Daniel Boone Coal Co. New miner's houses are being built and a new field will be opened up.

OHIO

Athens—The New York Coal Co. has filed suit against the Sunday Creek Coal Co. and others, alleging its lease to the defendant company of certain coal lands, with the equipment used in operating them, and the removal by the defendants of this equipment, consisting of cars, rails, etc. A restraining order preventing the removal of further property of this nature has been issued. The New York Coal Co. bases its case on a provision which it alleges to be contained in its leases, prohibiting the removal of the personal property in the mines under certain conditions.

INDIANA

Terre Haute—Fire recently destroyed the tipple and adjoining buildings of the Vandalia Coal Co.'s mine at Liggett, causing a loss of about $6,000. The cause of the fire is unknown. No one was injured. Chemical engines and hose trucks were sent from Terre Haute and prevented the spreading of the fire. The buildings destroyed will be replaced.

Boonville—The stripping machines at the Sunlight Coal Co.'s property and the Polk Patch coal mine are working day and night and are unable to fill all orders.

Sullivan—Orders have been received from the Federal Court by the receiver to lease the Glendora mine of the Consolidated Indiana Coal Co. to the Interstate Mining Co. at a royalty of 5c. a ton on a minimum of 30,000 tons annually and the St. Clair mine to the St. Clair Coal Co. at the same royalty on a minimum of 20,000 tons.

ILLINOIS

Virden—Nov. 22, fire completely destroyed the hoisting shaft, tipple and coal washer of the Chicago, Wilmington & Franklin Coal Co., entailing a loss estimated at $200,000. Three miners were seriously burned. It is thought the fire was of incendiary origin having started in the weighhouse near the top of the tipple where evidence of burning oil was seen.

Williamson—An eccentric slipped on the engine while 10 men were being lowered Nov. 22 in the No. 2 mine of the Mt. Olive & Staunton Coal Co., the cage falling to the bottom of the shaft. It was only a few feet from the bottom when the machinery became disarranged. All of the 10 were hurt, but only three were sent to the hospital.

Maryville—The top works of the Donk mine at this place were recently saved by a bucket brigade when threatened by fire which destroyed the public school building. Lack of water in the fire cisterns of the town increased the danger to the mine property.

COLORADO

Denver—The Delagua Mine (Las Animas County) of the Victor-American Fuel Co. has been running full time during the past month. Production in Routt County is progressing rapidly as is natural in a comparatively new field. There is a small car shortage at present but a greater one is feared.

FOREIGN NEWS

Lethbridge, Alberta—An action for foreclosure has been brought in the Supreme Court of Alberta against the Canadian Coal & Coke Co. by the Royal Trust Co. for the bondholders, the amount involved being $3,000,000. The stock of the Canadian Coal and Coke Co. is held principally in Montreal, the firm holding valuable coal leases near Lethbridge and elsewhere in Alberta. It is alleged that no interest has been paid on the bonds.

Glace Bay, N. S.—The output of the Nova Scotia coal mines has been seriously affected by the enlistment of miners. F. W. Gray, of the Dominion Coal Co. has brought this matter to the attention of the Canadian authorities. He states that his company alone has furnished some 1,500 men, or 14 per cent. of the total number employed. This has resulted in a diminution of the coal output of approximately 17 per cent.

Sydney, N. S.—Coal shipments from Sydney to St. Lawrence ports have closed for the season, and the total volume shows a considerable shortage as compared with 1914. The amount shipped is approximately 1,500,000 tons, or some 400,000 tons less than shipments for last year. One cause for the falling off is the requisitioning by the British government of the vessels chartered by the company.

PERSONALS

R. G. Harris, for a number of years with the Davis Colliery Co., recently became a member of the sales force of the Cortright Coal Co., of Philadelphia.

Edward Coyne, of Ottumwa, Iowa, has been appointed by the State Board of Control to prospect for coal on the Flynn farm near Des Moines, and on the state farm at Knoxville.

J. L. Heizer was recently appointed chief clerk of the Department of Mines of West Virginia to take the place of W. L. Thomas. Mr. Helzer will assume the duties of chief clerk at once.

John Whelan, Jr., former superintendent of the Massillon Coal Mining Co.'s mines at Massillon, Ohio, has been appointed secretary of the Eastern Ohio Operators Association. Mr. Whelan will assume his new duties Jan. 1.

Howard D. Pfeiffer, general manager of the Chaffee Coal Co., Real Estate Trust Building, Philadelphia, Penn., recently incorporated as H. D. Pfeiffer & Co. for the purpose of acting as the sales agency for Chaffee coal and trading in other fuels.

Benjamin Timey, formerly assistant foreman at the Philadelphia & Reading Coal and Iron Co.'s Potts Colliery, was Nov. 24, appointed superintendent of the North Franklin Colliery. This plant is one of the largest and most complete in the Schuylkill region.

A. D. Macfarlane, of LaFollette, Tenn., chief engineer for the receiver of the LaFollette Coal, Iron and Ry. Co., was on a trip the early part of this week to Birmingham and Tuscaloosa, Ala., inspecting coal washers and getting data on coal washing operations.

A farewell dinner was given, Nov. 23, at the Planters Hotel, St. Louis, Mo., by men prominent in local coal circles and long time friends, in honor of A. J. Moorshead, president of the Madison Coal Corporation who will shortly remove to Chicago after many years of activity in St. Louis.

Frank Kettle, of Nanticoke, John B. Corgan, of Luzerne, and John J. Stickler, of Lansford, were named on Nov. 26, as the new mine inspectors to fill the vacancies created for Luzerne and Carbon Counties, Penn., by the act of June 1, 1915, to serve until their successors are duly elected and qualified, subject to district assignment by James E. Roderick, Chief of the Department of Mines.

Samuel Reynolds, 71 years old, resigned his position as slope engineer of Nottingham colliery, Plymouth, Penn., on Nov. 26, a position he held for 36 years and 6 months. Mr. Reynolds deciding to take life easy, resigned his position, purchased a small automobile in which to enjoy the surrounding country. In point of service Mr. Reynolds was the oldest engineer in the employ of the Lehigh & Wilkes-Barre Coal Co.

William E. McGann, inside foreman of the Buck Mountain Colliery of the Lehigh Valley Coal Co., had his skull fractured, and Thomas R. Jones, division superintendent of the Delano & Pottsville division of the Lehigh Valley Coal Co., was injured internally on Nov. 24, when their touring car and a Philadelphia & Reading Ry. engine collided. McGann's condition is critical. His skull was crushed in, and an operation by trepanning was performed. Mr. Jones' condition is reported as serious. The accident occurred when the touring car ran on the crossing in front of the engine, which was returning from one of the Philadelphia & Reading collieries.

OBITUARY

Dennis Reardon, for many years a member of the mine examining board of Pennsylvania, died recently at his home in Shamokin at the age of 51 years. Mr. Reardon had been in failing health for almost a year but his condition was not regarded as serious until shortly before his death.

J. M. Hedge died in Chicago, Ill., on Nov. 23, at the age of 58 years. For ten years Mr. Hedge was traveling salesman for E. L. Hedstrom & Co., and for the eight years past was Western traveling salesman for the Philadelphia & Reading Coal and Iron Co., being attached to the Chicago office. He is survived by a widow and two daughters. Interment was made at Cape Cod, Mass.

Louis Kortkamp, manager of a mine at Hillsboro, Ill., was recently killed in an accident there after he had gone into the mine to make an inspection. A train of coal cars was being hoisted up a slope, and three of them became uncoupled near the top. Mr. Kortkamp was instantly killed when the cars struck him. His brother, Carl Kortkamp, was killed in the same mine and in the same manner about a year ago.

William A. Fuller, aged 45 years, died at his home in Hazleton, Penn., on Nov. 25, after a short illness of complications. He was superintendent of the Hazle Mountain Coal Co.'s workings at Buck Ridge and Tomhicken. Taking charge 20 years ago when the Wentz interests had abandoned the "drowned" mines, he reclaimed all of the unmined coal by preventing a creek from flowing into the workings. Mr. Fuller's remains were taken to Scranton, where the funeral took place from the home of his sister Mrs. Storrs.

INDUSTRIAL NEWS

St. Louis, Mo.—The Illinois Public Utilities Commission has assigned Dec. 21, 22 and 23 for the coal interests to present their case against the carriers in opposition to the proposed general advance in soft coal rates within the state of Illinois.

Milwaukee, Wis.—The Jeffrey Mfg. Co., of Columbus, Ohio, has recently opened a new branch office in the M. & M. Bldg., Milwaukee, Wis. This office will be in charge of A. Q. Dufour, who has had long experience and training in the application of Jeffrey products.

St. Louis, Mo.—The Illinois Public Utilities Commission has ordered the Baltimore & Ohio Southwestern Ry. Co., to reduce its rates on soft lump coal from Breese and Beckemeyer, Ill., to Lawrenceville, Ill., and intermediate points. The new rate will be 55c. per ton.

Alton, Ill.—The Alton, Granite City & St. Louis Traction Co. has just completed at its Alton steam plant a storage pit for 30,000 tons of coal which it expects to store under 2 ft. of water. The pit is expected to hold coal enough for the operation of that plant for 60 days.

Big Creek, W. Va.—The Lincoln Coal Mining Corporation, of Fairmont and Big Creek, W. Va., is putting out a $50,000 bond issue for the purpose of completing plant equipment and building additional houses in order to take care of the demands for coal which it is now receiving.

Thomas, W. Va.—The Bradford breaker of the Davis Coal & Coke Co. at this place was recently burned. The origin of the fire is unknown, but is believed to have been incendiary and for the purpose of crippling the supply of coal to the byproduct ovens of the Bethlehem Steel Co.

Philadelphia, Penn.—The East Broad Top R.R. is erecting a new transfer station at Mount Union, Penn., for transferring coal from narrow gage to standard gage railroad cars. The new station will contain a Link-Belt shaking screen and picking table and will cost approximately $45,000.

Buffalo, N. Y.—On and after Dec. 1 the Buffalo Foundry & Machine Co., manufacturers and builders of various varieties and types of chemical apparatus, driers, dry vacuum pumps, condensers, steamhammers, etc., will open an office in New York City in the Whitehall Bldg., at 17 Battery Place.

Philadelphia, Penn.—The Rock Hill Iron & Coal Co., 437 Chestnut St. Philadelphia and Huntingdon, Penn., will in the next few years spend approximately $500,000 to double the production of the Broad Top mine. This firm is now driving tunnels, purchasing steam and electrical equipment, etc., to this end.

St. Louis, Mo.—Missouri Pacific Ry. schedules increasing carload soft coal rates from Kansas City, Mo., to Pittsburg, Kan., and between other points in Interstate traffic were suspended Nov. 20, by the Interstate Commerce Commission until Mar. 21, next. The increases range from 65c. to $1.45 per ton.

Springfield, Ill.—Officers were recently elected by the Illinois Mining Institute as follows: President William Burton, Herrin; first Vice-President, Fred P. Haler, Belleville; second Vice-President, Patrick Hogan, Canton; Secretary and Treasurer, Martin Bolt, Springfield; Herrin was chosen as the place of next meeting.

Philadelphia, Penn.—George F. Lasher, William B. Whelen, and John Gilbert, trustees, of 147 No. 10th St., Philadelphia, wish to sell somewhat over 37,000 acres of Pocahontas coal, estimated as containing 242,000,000 tons. This tract lies in McDowell and Wyoming counties of West Virginia, and is provided with railroad facilities.

Cincinnati, Ohio—The C. G. Blake Coal Co., consignor of the cargo of coal on board the steamer "Genesee," which was recently seized by a British cruiser while bound for Montevideo, announces that it is fully protected in the matter by both ordinary and war insurance, and that the cargo, moreover, was legally the property of the consignee at the time of the seizure.

Uniontown, Penn.—A deal has been consummated between L. F. Ruth, J. M. Grey, K. K. Kremer, R. S. Matthews, E. K. Dick, all of Connellsville, whereby title to 400 acres of coal located in Morgan Township of Green County is acquired from W. R. Hawkins, and associates. The transaction involves an amount of approximately $300,000, some of the coal bringing as high as $800 per acre.

Detroit, Mich.—The Western Electric Co. has changed its Detroit headquarters from 263 Franklin St., to Kirby & Dequindre St. The new building is two stories high, and has a frontage of 150 ft., and a depth of 130 ft., and adjoins the Grand Trunk Ry. The change from the old quarters has been occasioned by healthy business growth which reached such proportions that the Franklin St. location became inadequate.

Baltimore, Md.—Contracts have been let by the Baltimore & Ohio for the construction of its new coal pier at Curtis Bay, Baltimore, which will cost approximately $1,500,000. All the work will be started at once, it being expected that the new improvement will be ready for operation during the season of 1916. The pier will have a capacity of 10,000,000 tons a year and will be the largest structure of its kind ever planned.

Wheeling, W. Va.—It was announced here recently that navigation companies on the Great Lakes were unable to handle the large amount of coal now flooding the docks. It is expected that word will be received shortly to annul all shipments. The shipments of some railroads have fallen off recently due to the docks and lake ports being filled to capacity and lake freighters being held up on account of the weather.

Fairmont, W. Va.—The management of the Western Maryland Ry. Co., has had to increase its order for new equipment. A contract for 1,000 additional steel hopper cars has been placed with the Pullman Co., of Pullman, Ill. An order for 2,000 steel hoppers was given this same company about a month ago. It is stated that the railroad is doing an immense business, and that a year from now it expects to do twice as much as it is doing at present.

New York, N. Y.—The Standard Paint Co., manufacturers of P. & B. insulating tape, has placed upon the market a rubber friction tape under its IMP brand. This tape will not compete with, or in any way displace the P. & B. tape. It is treated with a rubber compound, and finished by the friction process, and it is suitable for all kinds of wiring work. The older P. &. B. tape is especially adapted for severe atmospheric and weather conditions.

St. Louis, Mo.—R. W. Ropiequet, attorney for the Coal Operators Traffic Bureau of St. Louis has withdrawn complaint before the Interstate Commerce Commission, Docket No. 8,263, Coal Operators Traffic Bureau of St. Louis, Southern Coal, Coke and Mining Co., Lumaghi Coal Co. et al. Chicago, Burlington & Quincy R.R. alleging discrimination in differentials as between groups in Illinois. It is understood a satisfactory adjustment has been made.

St. Louis, Mo.—Officials of railroads operating eastward from Chicago and St. Louis report a heavy general tonnage, and some sections are short of cars. At the same time, the roads are hauling many empties westward. The great manufacturing districts reflect further activity, but aside from these influences there has been little change in the traffic situation on these lines during the past week. Officials of Southern roads report further gains in general tonnage which now is about 4 per cent. larger than in 1913.

Philadelphia, Penn.—The business of the Maryland Coal & Coke Co., in New England, that has heretofore been handled through the Boston office, will, in the future, be handled through the New York office. George E. Dunn, formerly New England agent at Boston, has been appointed manager of the New York office with headquarters at 17 Battery Place, New York City. William S. Johnson has been appointed assistant manager of the New York office. On or about Mar. 1 next, the company's office in Boston will be discontinued.

Birmingham, Ala.—The No. 4 furnace of the Sloss Sheffield Steel and Iron Co. was blown in on Nov. 26. This furnace has a capacity of 250 tons per day, and with the four other furnaces in blast will give this concern an output of 1,250 tons per day of iron. This is the first time in many years that both furnaces of this company have been in blast at North Birmingham at the same time, but the condition of the iron market made it expedient to put another furnace into blast. This furnace was relined and overhauled before going into blast.

Barbourville, Ky.—The general contract for construction and track laying of the Cumberland & Manchester R.R. from the Louisville & Nashville R.R. at Barbourville, to Manchester, Clay County, has been let and work on construction has begun, the line to be completed by the first of next July. The line will have a total length of 24 mi. and will open a large bituminous and cannel coal field, besides making a billion feet of hardwood timber available for market. Charles F. Heidrick, of Brookville, Penn., and Barbourville, Ky., is president of the Cumberland & Manchester R.R.

Reading, Penn.—The final chapter in the history of the Temple Iron Co. was recently completed when the Temple Furnace was sold to H. H. Adams, representing New York interests. It was the charter of the furnace company granted many years ago by the state that permitted the formation of the many underlying companies which it was claimed constituted the so-called coal trust and which the Government ordered dissolved through the courts over a year ago. The mining properties of the company were sold shortly after the decree of dissolution was granted and the recent sale of the furnace completes the compliance with the order of the court.

Wilkes-Barre, Penn.—The Lehigh & Wilkes-Barre Coal Co. has sent the following circular to its customers:

> The Supreme Court of Pennsylvania, on Oct. 28, 1915, declared unconstitutional the act of June 27, 1913, imposing a tax of 2½ per cent. on the value of anthracite coal prepared for market. When assured by the Commonwealth of Pennsylvania that no further proceedings will be undertaken to enforce payment of this tax, the amount of tax collected by this company, under the act, will be refunded. The tax now being added to the price of anthracite coal sold by this company is imposed by a later act of the Legislature of Pennsylvania, approved June 1, 1915, which supersedes, as of that date, the act recently declared unconstitutional. The validity of the later act has not been determined.

Sandusky, Ohio—The Big Four R.R. Co. is now planning to spend approximately a million dollars or more on dock improvements at this place. Plans are being exhibited, and the first informal announcement relative to the matter was recently made. When these docks are completed, Sandusky will rank among the first of the coal shipping ports to the Great Lakes. Present plans provide for the reclamation of a large tract of shore land, and the erection of a car dump which will make it possible to load several freighters with coal each day. Toledo is now considered as being one of the largest coal ports on the lake, but it would appear that in a few years Sandusky will be a close rival.

Birmingham, Ala.—The Pratt Consolidated Coal Co., will inaugurate barge service for the transportation of coal from Cordova to Mobile on the Warrior River as soon as specially constructed barges are available. A contract has just been awarded for the construction of 10 barges to a Mobile shipbuilding concern. These barges will be built under special design of the company and will cost several thousand dollars each. The company is now operating a weekly barge service on the Warrior River from Maxine to Mobile. The greater facilities for handling coal on the Warrior River due to construction of the 10 new barges and the increased river traffic that will result, are expected to have a bearing on the freight rate situation in Alabama.

Philadelphia, Penn.—An increase of more than 40 per cent. in coke shipments is the feature of the report of the coal and coke tonnage carried on the lines of the Pennsylvania R.R. east of Pittsburgh for October. Coke tonnage for that month totaled 1,225,848 tons, a gain of 509,838 tons over the same period last year. The carriage of anthracite aggregated 1,084,739 tons, or 37,399 tons ahead; bituminous coal shipments amounted to 4,304,466 tons, an increase of approximately 7 per cent. Aggregate fuel shipments in October amounted to 6,615,053 tons. Since Jan. 1 these three commodities have furnished tonnage to the amount of 54,275,580 tons. Only in coke, however, has an increase been registered in the 10 months' shipments over those of a year ago. In this respect coke has shown a gain of 1,326,556 tons.

Belleville, Ill.—A deed for the transfer of six coal mine properties, three in St. Clair County and one each in Perry, Washington and Randolph Counties, was filed in the recorder's office at Belleville recently. The deed is made by the Bessemer Washed Coal Co. to the Bessemer Coal and Mining Co. and the consideration is fixed at $127,700. The transfer includes the Bessemer coal-washing plant south of East St. Louis. The new company's main office will be in St. Louis. The mines in St. Clair County turned over are the Lenzburg, Marissa, Advance and New Oak Ridge mines, all on the Illinois Central Ry. south of Belleville. Leases on about 2,000 acres of coal land are included. William Stevenson, of Tilden, Ill., secretary of the new company, said the plan is to absorb the overhead charges of all the mines by one management and operate all the properties, including the washer in East St. Louis.

Coal Trade Reviews

General Review

Anthracite trade uncertain and hinging on weather conditions. Railroad embargos force bituminous buyers to cover. Exports at a standstill. Closing of Lake navigation finds the market strong. Cold snap causes an urgent demand in the Middle West.

Anthracite—The situation in the hard coal trade is indeterminate, fluctuating almost daily according to weather conditions. Supplies at the principal distributing centers are obviously small, and a sharp decline in temperature, sustained over any appreciable period, would undoubtably result in a critical situation. The car supply outlook is growing more ominous each day and some of the large companies have already been forced to draw on their storage supplies for the prepared sizes. At the present time the market hinges on the inadequate transportation facilities and any deficiency in supplies that develop at this time will be exceedingly difficult to overcome later in the season. The full company circulars are generally well maintained in spite of the relatively poor demand.

Bituminous—The reactionary tendency in the soft coal market has been wiped out by further unfavorable developments in transportation circles which has steadied up the market in a satisfactory manner. Sales agencies have placed a decidedly pessimistic construction on the announcement of the recent embargoes by a number of the leading trunk lines. The supply shows no increase and some of the best-protected sellers have been forced into the prompt market for tonnages to fill out gaps in their contract obligations. Hopes for some relief are anticipated when Lake navigation ceases, it being estimated by some that 25,000 cars will be released for other uses. Storms and heavy weather, combined with the shortage of vessel tonnage, have seriously interfered with the coastwise movement.

Exports—As a result of the combined effects of the unprecedented high ocean freights and the submarine warfare in the Mediterranean, shipments to Italian ports seem to have dropped off completely. Vessel rates continue to advance with monotonous regularity and each week finds them firm at new high levels. A few steamers are still being chartered, but this business can only be done where prospective shippers have firm orders on hand. The movement over the Hampton Roads piers for last week showed a gratifying increase, though still substantially below recent averages; shipments from other points have touched the lowest figures for several years.

Lake Markets—The Lake markets have stood up under the effects of the cessation in Lake shipping in unexpectedly good form. Sellers are in definite control of the prompt market, prices in which are firm with a buoyant tendency. Occasional odd tonnages of coal, diverted from the Lake trade, are subject to some pressure, but not of sufficient proportion to affect the general situation. The final Lake shipments were considerably delayed and irregular as a result of heavy storms, which accentuated the scarcity of vessel tonnage, but in spite of this there was a sharp rush at the close of navigation, receipts at the upper ports being unusually heavy. Railroad embargoes have persisted, and while no actual shortage has resulted as yet, there are some districts entirely cut off from shipments, in which difficulties will be experienced shortly.

Middle West—The recent lower temperatures have precipitated a flood of wire orders from outlying districts urging prompt shipments, which substantiate recent opinions regarding small stocks in the hands of the retailers. Many operators are sold up to their full rated capacity for 30 days ahead and report orders steadily increasing as the season advances. Screenings have stiffened up notably, while other grades are showing a strong disposition to act in sympathy. The steam demand is expanding in an impressive manner, while car and labor shortages continue impelling factors on the constructive side of the market.

A Year Ago—Warm weather threatens the anthracite market with a general slump. Bituminous situation dull and no improvement in sight. The Middle Western market beginning to stiffen up noticeably.

BUSINESS OPINIONS

Boston News Bureau—The situation in its entirety is acting as one would suppose it would in view of all the existing conditions. General trade is demanding more thought and attention, and this has the call over all other considerations. This country never saw such a combination of favorable features before in its history. With the new year we should witness an activity far above any previous estimate, spreading to every line of trade. New financing is occupying the attention of the financial interests to the exclusion of the stock market. The convening of Congress naurally modifies somewhat optimistic sentiment. But there is much that Congress can do to help confidence.

Iron Age—The pressure from manufacturing consumers for protection on contracts they have taken has led producers to book considerable finished material in the past week for the third and fourth quarters of 1916. The higher prices asked did not deter the buyers, plates and shapes for cars being sold at 1.85c., Pittsburgh, as against 1.70c. on first-half contracts. New export business has been checked by the action of leading producers in refusing offers from abroad of several dollars a ton above domestic prices, also by the railroad embargo and the stringency in the ocean freight situation.

Bradstreet—Nearly every prospect seems to please, and a year that started under a cloud of uncertainty or depression is ending with productive energies moving at high speed. This week's reports, reflecting as they do cumulative growth in trade and industry, display a marked degree of snap, the situation in general being the best noted for a long time past. Misgivings as to the immediate future are negligible, in the leading industries operations are being pushed to the utmost, labor is scarcer and payrolls are heavier.

Dun—Widely divergent lines in all sections reflect a sustained growth in business movements and volumes. Manufacturing operations still broaden, with overtime in force in many instances, while retail distribution steadily enlarges under the stimulus of increased payrolls and continued low temperatures. As the season advances, holiday goods become a more conspicuous feature and there is every indication that results in this particular branch will prove exceptionally gratifying.

Southern Lumberman—Price changes during the past week are again few, though there has been a somewhat larger spread in prices received by the various mills according to the stocks on hand at those mills. Somewhat higher prices than those quoted are reported by some mills, particularly Alabama operations, on certain items of dressed stock, while a very occasional report is made of a somewhat lower price offered on particular items by other mills.

Dry Goods Economist—Firmness, with a seasonable degree of activity, characterizes practically all of the dry goods lines. The prospects for an unusually large Christmas business are filling most retailers with optimism. The cotton market has been quiet, but firm. Exports of raw cotton for the nine months ending Sept. 30 last, reached a value in round numbers of $300,000,000 against $242,000,000 for the corresponding period of last year. Raw wool continues firm.

American Wool and Cotton Reporter—Although a smaller volume of sales was consummated during the past week because dealers have marked up prices, the wool market remains fully as firm as it has been for several weeks. So much wool has been taken and as there are several shortages what wool is left will bring high prices. By Jan. 1 it is expected that stocks will be light. Woolen mills are very busy with orders booked several months ahead, and it is stated that one manufacturer has a year's business to take care of.

Marhall Field & Co.—Current wholesale distribution of dry goods has exceeded the record of the corresponding period of a year ago by a considerable margin. Road sales for immediate and future delivery have been greater than for any year since 1909. Customers have been in the market in about equal numbers. Collections are above normal. Prices are firm.

ATLANTIC SEABOARD

BOSTON

Weather interferes with shipments from Hampton Roads. On car prices higher because of water freights, but canvass for next year contracts at minimum figures. Georges Creek receipts light. Pennsylvania coals easier. Delays on anthracite.

Bituminous—Storms and thick weather have practically deadlocked shipments along the coast. Boats are in very short supply and there is apprehension over the outlook a month or two hence. At the same time New England probably has better stocks than other sections. Prices on Pocahontas and New River show no change f.o.b. with an ample tonnage standing at all the piers. No spot market of any consequence has developed, f.o.b. Hampton Roads, and there is not likely to be any until marine transportation gets somewhat straightened out.

On cars at Boston, Providence and similar points prices have advanced materially on account of higher water rates, but inquiry so far is confined largely to distributors who are buying to keep customers going until cargoes arrive.

The canvass for contracts from Apr. 1, 1916, is still on; $3.30 on cars Mystic Wharf, Boston, is the lowest price yet heard, although this was for fairly large tonnages. Smaller contracts are being closed at $3.40@3.50. A few more good sized orders have been closed on a delivered basis and it begins to look as if the usual contract season next February or March would be conspicuous by its absence. A lot of quiet work has been done and so keen is the rivalry for tonnage that most buyers are likely to get their fuel at lower prices than for several years.

Receipts of Georges Creek by water are also being hampered by the weather, but no scarcity is felt as yet. Deliveries all-rail are coming through very slowly.

Higher prices on the Pennsylvania coals are bringing out many offers of spot coal. The shippers of the higher grades are limiting their shipments to contract business, preferring to get some of their obligations behind them now and have their free coal later, if at all, when prices are expected to be even higher. Car supply is little if any improved on most roads and some of the largest buyers are being forced into the market for coal known to be at or near the transfer points; $1.75 is about the price for the better Cambrias and Somersets, while almost any of the Clearfields, if spot, will command $1.35@1.50.

Water Freights have further advanced to $1.25@1.35, Hampton Roads to Boston, on large vessels, but with few bottoms offering; $1.20 has been paid Norfolk to Providence, other rates in proportion, while 60@70c. is the range from New York ports to Providence and New Bedford, with an active demand.

Anthracite—The shipping companies are being flooded with orders, particularly since buyers have become aware of the delays in getting cargoes off. It is a shortage of transportation rather than coal, and when one to two trips are lost it is hard to make good the deficiency so late in the season. The outlook is excellent for brisk trade throughout the winter.

Bituminous quotations, f.o.b. loading ports at points designated, are about as follows:

	Philadelphia	New York	Baltimore	F.o.b. Mine
Clearfields	$2.50@3.00	$2.75@3.30	....	$1.25@1.75
Cambrias and Somersets	2.60@3.05	2.90@3.35	....	1.35@1.80
Georges Creek	2.92@3.25	3.22@3.55	$2.85@3.18	1.67@2.00

Pocahontas and New River prices, on cars Boston, are $3.75@3.90; Providence, $3.75@3.85; and f.o.b. loading ports at Hampton Roads, $2.80@2.85.

NEW YORK

Warmer weather causes anthracite demand to ease up. Tidewater docks generally bare of coal. Steam coals active. Bituminous short and prices increasing. Coal delayed in delivery. Free coals bringing $3 f.o.b.

Anthracite—The hard coal is quiet, but supplies are so short that a sudden demand would result in a serious situation. Present conditions are the exception for this time of the year; the car shortage seems to become more acute and this, together with the shortage in the year's production, has resulted in an unusual situation. Complaints of lack of cars are increasing. Most individual operators have sufficient orders to carry them over several weeks, but they are seriously handicapped by the inadequate car supply. The local roads continue badly congested.

Most wholesale dealers are short of coal, while large retailers, who as a rule need not worry about shipments, are making inquiries as to the situation and the prospects. Egg coal is the only prepared size offering at less than full circular. Straight cargoes of stove coal bring slight premiums and chestnut is moving well. The steam grades are active and prices remain firm. Buyers of the buckwheat coals are being advised to store all they possibly can get at prevailing prices.

Current quotations, gross tons, f.o.b. Tidewater, follow:

	Lower Ports		Upper Ports	
	Circular	Individual	Circular	Individual
Broken	$5.05		$5.10	
Egg	5.30	$5.20@5.30	5.35	$5.25@5.35
Stove	5.30	5.30@5.30	5.35	5.35@5.35
Chestnut	5.55	5.55@5.55	5.60	5.55@5.60
Pea	3.50	3.45@3.50	3.55	3.50@3.55
Buckwheat	2.75	2.45@2.75	2.80	2.45@2.80
Rice	2.25	1.95@2.25	2.30	2.00@2.30
Barley	1.75	1.50@1.75	1.80	1.75@1.80

Bituminous—Prices continue to advance and still higher figures are looked for. Arrivals are greatly delayed by the congestion along the various trunk lines and there is little free coal at the docks. Operators last week obtained about 60% of the usual car supply. Little coal is being stocked, all the available supply being applied direct to contracts. Free coals are snapped up quickly and there is little to be had by the spot buyer. The cheaper grades are bringing from $2.90 to $3 f.o.b., and mine prices have advanced correspondingly. Some of the better grade coals are practically out of the market. Slack continues strong at from $1.05 to $1.15 with occasional quotations of 10c. higher.

Water freights are strong. The first of the week they had touched $1.05 to Sound points, while an average of 25c. was quoted around the harbor.

Current quotations, gross tons, f.o.b. Tidewater, are about as follows:

	South Amboy	Port Reading	St. George	Mine Price
Georges Creek Big Vein	$3.20@3.30	$3.20@3.30	$3.20@3.30	$1.75@1.85
Georges Creek Tyson	3.20@3.30	3.20@3.30	3.20@3.30	1.65@1.75
Clearfield:				
Medium	3.00@3.05	3.00@3.05	....	1.45@1.50
Ordinary	2.90@3.00	2.90@3.00	....	1.35@1.40
Broad Top Mountain				1.25@1.45
Cambria County:				
South Forks	3.20@3.30	....	....	1.65@1.75
Nanty Glo	3.20@3.30	....	....	1.65@1.75
Barnesboro	3.10@3.20	....	....	1.60@1.70
Somerset County:				
Quemahoning	....	3.20@3.30	3.20@3.30	1.65@1.75
Medium	3.00@3.20	3.00@3.20	3.00@3.20	1.50@1.65
Latrobe	2.90@3.00	....	....	1.35@1.45
Greensburg	2.00@3.10	....	....	1.35@1.45
Westmoreland	3.20@3.30	....	....	1.45@1.55
West Virginia Fairmont ¾		2.90@3.00	2.90@3.00	1.10@1.20
Fairmont mine-run		2.80@2.90	2.80@2.90	1.00@1.10
Steam		2.90@3.00	2.90@3.00	1.35@1.45
Western Maryland		2.90@3.00	2.90@3.00	1.35@1.45

PHILADELPHIA

Anthracite moving steadily. First storage coal shipped. Stove leads prepared sizes, with chestnut beginning to show strength. Egg weak. Heavy shipments of pea. Car shortage advances bituminous prices. Some relief expected when Lakes close. Exports quiet.

Anthracite—Business is moving along steadily. There has been very little price cutting in the wholesale market, but the retailers have shown very little inclination to increase their prices. Pea coal which continues the main point of attack will surely cost the dealers at least 25c. per ton more after Dec. 31. Most of the large dealers will go into the new year with capacity stocks of this size bought at the low price and it is hoped that the price-cutters will not sacrifice this advantage.

Considerable storage coal has come to this market, especially from one of the larger companies. Another big company has also been sending large quantities of storage pea and buckwheat to market, the former due to the approaching advance in price, and the latter due to the increasing demand from steam users. Storage yard coal is not usually in much favor, but the prepared grades which have been shipped were re-screened and washed.

Collections continue satisfactory, both the wholesale and retail houses giving them careful attention. Sales by the price-cutters are for cash only; it has been the practice with a good many of the better firms, to sacrifice 25c. per ton for cash. It seems strange, however, that no matter how notorious for poor pay either a dealer or consumer has become, there is always a shipper or dealer who will take a chance.

The demand for broken coal continues and all that not sold on contract at $3.25 and tax is bringing the full price of $3.50 and tax; it is also rumored that there will be made an advance of from 10c. to 20c. per ton on new contracts.

At present egg seems to be the weak spot and even small sales were recently made at from 15c. to 25c. off circular.

Stove is probably the leader of the prepared sizes and seldom sells off price. Chestnut grows more popular as the season advances and while slight concessions are occasionally made the good grades are up to the full circular.

Pea is certainly in strong demand and the dealers protected until Dec. 31 at the $2 and tax rate are putting away every car they can and in many instances the stocks of the large sizes are being reduced and the extra bin room devoted to the pea size. This naturally lessens the demand for the larger sizes though the bins will be refilled soon after the first of the year.

The prices per gross ton at the mines and f.o.b. Port Richmond for tide shipments are as follows:

	Line	Tide		Line	Tide
Broken............	$3.50	$4.75	Pea...............	$2.50	$3.25
Egg..............	3.75	5.00	Buckwheat.........	1.50	2.25
Stove.............	4.00	5.00	Rice..............	.85	1.75
Chestnut..........	4.15	5.25	Barley............	.50	1.50

Bituminous—The market continues to be dominated solely by the car supply and there is a gradual creeping up of prices toward the $2 mark. While there was apparently no general increase this week, yet new prices were asked for a number of the better grades. The principal change was in Georges Creek, which advanced from 10 to 15c.

The demand for fuel continues good, with supplies difficult to get, as many shippers state they are only receiving from 27% to 40% of the cars needed at their mines. The only hope of early relief is held out in the fact that usually in December of each year there is an easing up in the car supply owing to the closing of navigation on the Lakes, which will release about 25,000 cars. The export trade continues quiet.

The prices per gross ton at the mines have ruled about as follows:

Georges Creek Big Vein..	$1.85@2.00	Fairmont gas, ¾.........	$1.35@1.45
South Fork Miller Vein..	1.65@1.75	Fairmont gas, mine-run..	1.20@1.25

BALTIMORE

Export trade flat. Car movement poor and contracts are back. Indifferent demand keeps prices low.

Lack of vessel bottoms and impossible freight rates of from $18 to $20 a ton to Mediterranean ports, and in proportion to other points, has killed the export coal movement for the time being. The past week saw a total of but 1,135 tons loaded here for foreign delivery, the smallest in several years.

Operations in the Fairmont and Somerset districts have been down to not more than a 30% capacity due to poor car supply. Most operators and middlemen are now behind on their contract obligations. Practically all unattached coal is being taken up to fill in gaps on contracts.

Prices in gross tons to the trade may be quoted about as follows:

	Mines	Balt.*	Fairmont	Mines	Balt.*
Geo. Crk. Big Vein	$1.80	$2.98	Ordinary mine run	$1.00	$2.43
Geo. Crk. Tyson...	1.50	2.68	Ordinary ¾.......	1.10	2.53

Somerset (good)...	1.25	2.43			
Quemahoning.....	1.50	2.68			
Freeport.........	1.20	2.38			
Miller Vein.......	1.30	2.48			

* F. o. b., outside Capes.

Anthracite sales have been increased by cooler weather, and arrivals have been rather slow due to lack of cars.

HAMPTON ROADS

Movement foreign and coastwise light. Government takings small. Demand from Italy shows a big decline.

Shipments from Hampton Roads have been anything but satisfactory. The movement both coastwise and foreign has been light and the government takings were small. The largest cargo of the week was taken care of by the Panama Collier "Achilles" and went to Cristobal. The demand from Italy seems to have dropped off completely and due to the submarines in the Mediterranean and the high freight rates. Most of the coastwise movement has been to Boston and Providence. There have been few government ships in port; government takings have been light especially as regards barge loading.

Railroad Tonnages—Dumpings over the local piers for the past five weeks compare as follows:

Railroad	Week Ending Oct. 30	Nov. 6	Nov. 13	Nov. 20	Nov. 27

OCEAN FREIGHTS

At $4.50 per quarter (which is about $18 per ton) on grain to the West Coast of Italy and Mediterranean, rates are firm and advancing. South American rates are practically the same as a week ago, while rates to the West Indies are firmer. We have chartered a few steamers for export coal since our last report, but none of these fixtures have been reported. The only way in which coal chartering can be arranged is by shippers getting orders firm in hand, so that they are in position to make positive offers, and although tonnage is more than scarce, occasionally steamers can be obtained if shippers can pay market rates. In some instances we have been obliged to charter steamers on time charter, as we could not arrange charters for shippers on a satisfactory rate basis.

We would quote freight rates on coal by steamer as follows:

To	Rate	To	Rate
Havana..............	$2.75@3.25	Bermuda..............	$3.50@ 4.00
Cardenas or Sagua......	3.00@3.50	Vera Cruz............	5.00@ 6.00
Cienfuegos............	3.25@3.75	Tampico..............	5.00@ 6.00
Port au Spain, Trinidad.	4.25@4.50	Rio..................	10.80@11.40
St. Lucia.............	4.00@4.50	Santos*	11.40@12.00
St. Thomas............	3.75@4.00	Montevideo............	**12.00**
Barbados..............	4.25@4.50	Buenos Aires or La Plata†	**12.00**
Kingston..............	3.75@4.00	Rosario...............	**13.20**
Curacao...............	**4.00**	West Coast of Italy.....	21.60
Santiago..............	3.50@4.00	Barcelona**............	19.20@20.40
Guantanamo...........	3.50@4.00	Valparaiso or Callao....	11.00@12.00
Demerara.............	6.00@7.00	Marseilles.............	20.40@21.60

* Consignees paying dockage dues. ** Spanish dues for account. † Quotations on Plate coal by British steamers; neutral steamers are more difficult to obtain and the rates are always higher.

W. W. Battie & Co.'s Coal Trade Freight Report.

Note—Figures in **bold face** type are only approximate.

LAKE MARKETS

PITTSBURGH

Prompt coal steady; contract coal higher. Car shortage threatening and weather unfavorable for car movement. Three-month contract at $1.22½.

The market for prompt coal has suffered no setback on account of the termination of Lake shipments, as conditions in general have improved, as to consumptive prospects, and cars have become very scarce. These influences have naturally affected the contract market for contracts up to Apr. 1, and prices on contract have stiffened very decidedly. It is the universal view in the trade that coal prices will stiffen after December, and even fancy prices would not be surprising for March. Contracts that involve the immediate commencement of shipments, so as to include December, are therefore more eagerly sought than contracts involving merely the first three months of the new year. On a contract involving 1,000 tons a day of mine-run, December to March inclusive, $1.22½ has been done, but this is regarded as below the current market, even for shipment beginning Dec. 1.

The car shortage is more pronounced and trouble is experienced at nearly all mines, but the influence has been to make the market sensitive rather than actually to advance it. Reports are that at some points the congestion is being relieved, but on the other hand the weather this week turned bad, promising more trouble for the railroads. The domestic demand may be expected to improve in the next fortnight as real winter weather is promised, against the unseasonably mild weather lately prevailing.

Slack has stiffened sharply and is not available at under about 95c. for prompt and $1 on contract to Apr. 1. We quote prompt coal as follows: Slack, 95c.; nut, $1.15; mine-run, $1.15@1.20; ¾-in., $1.25@1.35; 1¼-in., $1.35@1.45; contract to Apr. 1: Slack, $1@1.05; nut, $1.25; mine-run, $1.25@1.30; ¾-in., $1.35@1.40; 1¼-in., $1.45@1.55, per net ton at mine, Pittsburgh district.

BUFFALO

Stronger market for bituminous. Eastern demand improved greatly. Canada still buying very little. Overconfidence caused increase of coal on track. Anthracite quiet, due to warm weather.

Bituminous—There is a distinctly better feeling in the trade. Where the shipper can reach Tidewater the demand is strong and the coal moves briskly. Markets southward and on the coast continue more active than here, though the late improvement here now places this market in a strong position. At the same time the slackness in Canada will continue to affect Buffalo, though jobbers are finding a good trade in Boston and westward, practically all the way through the state.

At the same time there has been too much coal on track here of late. Certain Lake shippers have diverted coal here which they have been offering at low figures, though there has not been sufficient to affect prices. There has also been some coal here from south of Pittsburgh that pays a $1.40 rate.

Prices are somewhat stronger than a week ago, but figures are unchanged, as follows:

	Pittsburgh	Allegheny Valley	Penn Smokeless
Lump	$2.80	$2.50	$2.55
Three-quarter	2.65	2.30	.....
Mine run	2.55	2.20	2.30
Slack	2.15	1.90	2.30

Quotations are f.o.b. cars at Buffalo or the Niagara bridges and per short ton except east of Rochester or Kingston, Ont.

Conditions will be more or less disturbed now till the winter movement is established.

Anthracite—There is not much life to the market, owing to the warm weather. The shortage of chestnut is the feature of the trade; it is said to be quite as pronounced as it ever was before the price was advanced and shippers are offering stove size instead, though the substitute is not very acceptable. As the warm spell is extended, there is more fear that when winter does set in there will be a rush that cannot be met. There is much complaint on the part of independent anthracite shippers that they are not able to get box cars.

The local trade is quiet, but improves rapidly whenever the weather increases in severity. Shipments by Lake continue good, being 103,300 net tons for the week. Buffalo prices remain as follows per long ton, f.o.b. cars: $5.60 for grate, $5.85 for egg and stove, $6.10 for chestnut, $4.30 for pea, with 25c. additional for loading on board vessel.

COLUMBUS

Strength of small sizes the feature of the trade. Prices 10 to 15c. higher and in some cases even more. Domestic demand better.

The trade has been fairly active, especially the steam sizes, which are stronger all along the line. Domestic demand is also better, due to lower temperatures. The tone of the market has been good and future prospects are bright.

Manufacturing is growing more active, and fuel requisitions are correspondingly increasing. Railroads are taking a larger tonnage. Car shortage is more marked and West Virginia mines are working only 50 to 60% of the average. This should help the local market as roads in this state are better able to move coal. The holiday of last week cut into the tonnage although the production was fairly large. There is a good demand for the fancy grades and there is a disposition among retailers to stock up in anticipation of a rush.

The Lake trade is about over although a few cargoes are still to be loaded. On the whole the Lake season was not as active as in some former seasons the Sunday Creek Coal Co. having shipped no Lake coal at all though other Ohio operators shipped a fair tonnage. The Hocking Valley docks at Toledo have loaded 2,543,000 tons since the opening of navigation.

Anthracite demand is increasing as the winter approaches.

Prices in Ohio fields f.o.b. mines, per short ton, are as follows:

	Hocking	Pomeroy	Eastern Ohio	Kanawha
Re-screened lump	$1.60	$1.65	.....	.....
Inch and a quarter	1.50	1.50	$1.35	$1.50
Three-quarter-inch	1.35	1.40	.....	1.35
Nut	1.25	1.30	.....	1.25
Mine-run	1.15	1.20	1.05	1.10
Nut, pea and slack	.80	.85	.75	.70
Coarse slack	.70	.75	.65	.60

Mines have been working at about the following percentages of full capacity:

	Week Ended					Week Ended			
District	Nov. 6	Nov. 13	Nov. 20	Nov. 27	District	Nov. 6	Nov. 13	Nov. 20	Nov. 27
Hocking	60	50	60	50	Cambridge	70	70	75	70
Jackson	45	40	45	40	Massillon	70	70	75	60
Pomeroy	85	85	85	80	Eastern O.	80	75	80	75
Crooksville	65	65	65	60	Average	68	65	69	62*

*Decline due to Thanksgiving Day holiday.

TOLEDO

Trade optomistic. Delays in transportation the most serious difficulty. Lake season practically closed.

There is an optimistic spirit among dealers. The only difficulty is the traffic congestion and it is believed that this will be relieved. Domestic business has been greatly stimulated by the cool weather of the past several weeks. Retailers have been very busy and the wholesalers and jobbers have felt the effects of the heavier buying. Steam prices are firm at close to the list. The Lake season is practically over although there is still some little movement.

CLEVELAND

Retail business active due to colder weather and snow. Steam coal in fair demand with light receipts. Closing of the Lake market has increased supply of coarse coal.

The fine-coal market is fairly well cleaned up with prices firm. Receipts are not very heavy as contract business is good. The shortage of cars is reducing arrivals, and Lake coal mining is practically over although loading of storage coal may follow.

Coarse coals are not moving well and domestic sizes of some grades, particularly Pocahontas, are none too strong at quotations. Jobbers have bought Pocahontas lump and egg at $1.90, mines, although the usual run of prices is 5c. higher.

Quotations are as follows to jobbers f.o.b. Cleveland per short ton:

	Pocahontas	Youghiogheny	Bergholz	Wainwright	No. 8
Freight	$1.45	$1.00	$0.70	$0.70	$0.90
Lump	3.40@3.45	.....	.....	....	.....
Lump, 6 in	....	.....	2.30	....	.....
Lump, 1¼ in	....	2.30	2.10	2.25	2.05
Lump, ¾ in	....	2.20	2.00	2.00@2.10	1.90
Lump, 3 in	....	.....	.....	2.40	.....
Egg	3.40@3.45	.....	.....	....	.....
Mine run	2.70	2.10	1.90	1.90	1.80
Slack	....	1.95	1.80	1.80	1.80

DETROIT

Demand for steam coal well sustained. Domestic grades softer due to warmer weather. Grand Trunk embargo reduces anthracite supply. Lake trade nearly over.

Bituminous—Steam coal users show little disposition to build up reserve stocks though buying continues to improve in spite of the fact that orders are for moderate tonnage. There is every indication of a steady consumption, which it is believed will continue. The demand for small sizes is still the most active. Higher temperatures have restricted the sale of domestic coal but the market is rather active and shippers are anticipating larger orders soon. There is not much consignment coal on tracks and forced sales infrequent. Car shortage in sections is causing delays in delivery.

More serious, however, is the embargo which the Grand Trunk has renewed for another week. This has shut off hard coal shipments over the company's tracks and has also cut off the movement of soft coal from Toledo. It is reported that about 900 carloads of coal are held up outside of Detroit, while other roads serving Detroit are forced to give track storage to 500 or more carloads of freight, including coal, the consignees of which are on Grand Trunk tracks. While no actual shortage is so far reported, many of the yards served by the Grand Trunk are said to be running very low on stock. It is feared the embargo may be continued indefinitely.

Lake Trade—Lake shippers are finding it increasingly difficult to charter vessels, particularly for ports on Lake Michigan. Rates on grain and iron ore are maintained at a figure which stimulates effort at speed in getting ships back to loading ports, while delays due to storms have made quick dispatch more imperative, leaving few vessels obtainable for coal.

CINCINNATI

Lack of sustained cold weather creates a general sluggishness though prices are firm, due to the car shortage.

There has not been any really cold weather, so that the demand for the prepared grades is still abnormally low. Dealers' stocks have apparently not been sufficiently reduced to force them into the market to any extent. With a relatively light industrial demand as well, the market would be in a bad position were it not for the pronounced shortage of cars. Only severe winter weather for a somewhat protracted period will stimulate any general activity.

LOUISVILLE

Domestic grades weak but steam sizes are strong.

The Kentucky market is weak and long on domestic, though there are short stocks in the retailers hands. The steam-coal market is strong, with demand really ahead of the supply, which accounts for the over-production of the domestic grades. There are prospects for a flurry of some proportions in the screenings market.

Quotations in the Eastern field range all the way up to $2.40 for fancy block, although it is said that sales are below the quoted price in some instances. In western Kentucky the bulk of the lump is going at $1.25 or thereabouts. Sales in the Eastern field have been made during the week, long ton basis, f.o.b. mines, at from $1.60 to $2, and in special cases upward, on block and from $1.10 to $1.40 for egg.

BIRMINGHAM

The past week has shown very little change in the coal market, either on steam or lump coal. Steam coal is in slightly better demand, owing to the railroads taking larger tonnages on their contracts, in anticipation of a possible car shortage during the winter months. On the whole, the market is satisfactory on both grades and the prospects are encouraging for a steady business during the next sixty days.

COKE

CONNELLSVILLE

Market not well defined, demand being light Foundry coke demand fair, with stiff prices compared with furnace grade. Production and shipments slightly increased.

The coke market is not very clearly defined. Prices lately going for prompt furnace coke have not been such as to attract operators, and it is possible they have been accumulating a little surplus against the fancy prices so generally predicted for holiday time. There is scarcely any demand for prompt coke so that the market is not thoroughly tested. Practically all the furnace coke contracting has now been done, and there are only occasional inquiries for all or any part of next year. As consumers have had to pay considerably higher prices on contracts for shipment after Jan. 1 than they are paying on current contracts, to expire Dec. 31, they have naturally been insisting on heavy shipments, and the end of the year may find them with fair supplies in yard or on track, a condition that would militate against any sharp advance on prompt coke.

Foundry coke continues in fair demand for prompt lots, and as high as $3.25 is still obtained by a few operators who furnish particularly good coke and can make instant shipment, but there is other foundry coke of good grade available for considerably less. Not much activity has developed as to contracts for the first half of next year. Many consumers, perhaps the majority, have twelve-month contracts, running to July 1. We quote: Prompt furnace, $2.15@2.25; contract furnace, first half, $2.35@2.50; year 1916, $2.25@2.35; prompt and contract foundry, $2.90@3.25, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Nov. 20 at 433,402 tons, an increase of 6,021 tons, and shipments at 435,337 tons, an increase of 4,834 tons.

Baltimore—The movement of coke has been erratic. Following a decided upward trend of two weeks since, when best Connellsville touched $3.50, and West Virginia $3, there was a reaction. Prices quoted to the trade here are about as follows: Low sulphur 72-hr. Connellsville, from $2.75 to $3; same, West Virginia, $2.50; 48-hr. Connelsville, $2.25 to $2.50; same, West Virginia, $2 to $2.25.

Buffalo—The market is strong at former quotations, which are on the basis of $4.85 to $5 for 72-hr. Connellsville foundry. This market is not so active as it is in the producing districts, but is gaining. There is a scarcity of men, both at the ovens and in factories, which makes deliveries slow.

Chicago—The coke market is brisk with the supply short. Connellsville commands $5.75, and byproduct foundry has shown an advance of 25c. per ton. Gas house coke is stronger. Prices per net ton, f.o.b. cars Chicago, are as follows: Byproduct, foundry, $5.50@5.75; byproduct, domestic, $4.95@5; Connellsville, $5.50@5.75; Wise County, $5.25@5.50; gas coke, $4@4.25.

MIDDLE WESTERN

GENERAL REVIEW

Domestic demand fairly active. Steam coals booming. Screenings score further advances. Eastern grades still variable.

The situation in the Western coal markets is very encouraging. Railroads are storing more coal and trade is expanding everywhere with a broader distribution of shipments. Orders for all grades and sizes are now arriving in steady volume. Lower temperatures earlier in the week caused a spurt of orders by wire from many retailers with light stocks, who urged prompt shipment. Country absorption has been more extensive, and it is obvious that many retailers do not hold normal stocks for this time of year.

Shortages of cars and labor still persist. No consignment coal of any consequence is on hand at Western points. Industrial conditions have greatly improved, with steam demand advancing steadily. Screenings and slack maintain their strong position, and show tendencies toward further stiffening. Steam lump is asked for in larger quantities, and prices show greater firmness. Coarse sizes at Indiana and Illinois mines have been moved as fast as produced this week.

CHICAGO

Illinois and Indiana domestic sizes strong. Smokeless coals easy. Hocking grades holding strictly at circular.

Hand-to-mouth buying prevails to a large extent among the public, with constant re-ordering in small quantities, and the result is that many yards have found sales substantially less than previous years.

Franklin and Williamson County coals are moving in fair volume. Prices are rigidly maintained, and the mines are averaging four to five days per week. Screenings from southern Illinois mines are averaging around 70 to 75c. Saline County domestic sizes are moving at $1.75.

Railroad orders to the mines in Central Illinois have been increased, and some of the coal shipped is undoubtedly going into storage. The domestic sizes are firm at $1.75 and screenings are moving steadily at around 70 cents.

The recent cold snap brought an influx of orders for Indiana domestic coals by wire, confirming the opinion that storage supplies of retailers were below normal. An advance in price is scheduled for next week, perhaps 25c. per ton for domestic lump. Steam coals are strong, and such surplus tonnage as is not covered by contracts will undoubtedly yield higher prices in December.

Pocahontas lump has been soft but mine-run has held firm at $1.40; egg is easy around $1.65. It is felt that as the winter develops the situation in smokeless coals will grow stronger. No surplus splint coal has been available for sale in this market. Box car splint lump shipments are being sold readily at $1.60 for direct forwarding from the mines. Pennsylvania smokeless lump, egg and mine-run are still in a strong position due to car shortages.

Hocking domestic lump is firm at from $1.65 to $1.75, and tonnage reaching this market about equals demand. The Hocking steam trade shows improvement, and fine coals are absorbed as fast as produced.

Car supply at Kentucky mines has improved. Some Eastern Kentucky domestic lump has been advanced to $2.40, while second grades have sold as low as $1.90. Mine-run is somewhat weaker.

Orders for anthracite from Northern Indiana have been increasing. In Western states like Iowa, Nebraska, Kansas and Missouri the stocking requirements for this year seem to be satisfied, although colder weather may cause some orders to appear. There is an increased rail movement of anthracite to Northwestern points. Chestnut is in good demand, and egg has been slow.

Quotations in the Chicago market per net ton, f.o.b. cars at mines are as follows:

	Williamson and Franklin Co.	Springfield	Sullivan	Clinton	Knox and Greene Cos.

Kanawha splint Lump, $1.60.

INDIANAPOLIS

Large mines now well sold ahead. Prices not generally higher, but are quite firm. Storing against possible shut-down in the spring.

There is now no doubt of a well-established improvement in the Indiana coal trade. The largest operators report their mines sold up for thirty days and that they anticipate a busy winter. They are able to place more coal as the season advances. Railroads and factories are stocking, as well as buying freely to cover current needs. There is general industrial activity and steel plants, particularly, are going full time. Prices of screenings have advanced and nothing is being offered under 80c. f.o.b. mines, with No. 4 commanding 90c. Other grades have sympathetically stiffened, domestic lump selling at $1.60 to $1.65 f.o.b. mines. No. 4 mine-run is offered at $1.15 to $1.20, f.o.b. mines, and Nos. 5 and 6 at $1.05.

ST. LOUIS

Mild weather causes a slowing up in domestic grades and the market has been maintained with difficulty.

Continued fine weather has caused a moderate slump in the lump grades during the past week. Demoralization in prices has been averted by the operators holding their output on track in the belief that cold weather cannot be far off. Stagnation in lump has sent the finer grades up some.

Quotations f.o.b. mines during the past week have ranged on the following basis per short ton:

	Frnk. Co.	Wlmson. Co.	Staunton	Standard
6-in. lump.............	$1.50@1.65	$1.50@1.65	$1.25	$0.90@1.10
8-in. lump.............	....	....	....	1.15
2-in. lump.............	....	....	1.15	1.00@1.10
3x6 egg................	1.40@1.65	1.40@1.65	....	1.00@1.15

Freight Rates—Inner group, St. Louis, 57½c., East St. Louis 37½c. Outer group, St. Louis, 72½c., East St. Louis, 52½c.

DULUTH

Season of navigation soon to close. Receipts are heavy. Shipments are brisk.

Coal receipts during the past week have been quite heavy. Dock companies are rushing coal cargoes forward in anticipation of the close of navigation, which is likely to occur at any time. Heavy storms on the eastern end of Lake Superior delayed the arrival of many vessels last week, and hence there is considerable bunching of cargoes this week, no less than 19 vessels having arrived in one day.

Shipments have been well maintained, freezing weather and the appearance of snow having induced many retailers and the householders to stock up. The demand from the railways and steam users has been quite brisk and conditions generally for the past week have been very satisfactory. Prices per short ton f.o.b. docks are as follows:

	Yough	Splint	Hock	Smokeless	Elkhorn
Lump...........	$3.40	$3.40	$3.40	$4.75	$3.75
Dock run........	3.10	3.10	3.10	3.25	3.25
Stove or nut.....	3.40	3.40	3.40	4.75	3.65
Screenings.......	2.40	2.40	2.25	2.75	2.40

Conditions have been quite favorable during the past week and there has been a heavy movement of anthracite coal. The weather has been cold and the first appearance of winter shook out a large number of orders for immediate shipment. Prices per short ton f.o.b. docks are as follows: Nut, $7.10; egg and stove, $6.85; pea, $5.55 and buckwheat, $4.

PRODUCTION AND TRANSPORTATION STATISTICS

BALTIMORE & OHIO

The following is a statement of coal and coke tonnage moved over this system and affiliated lines during October and the previous two months:

	August		September		October	
	1915	1914	1915	1914	1915	1914

FOREIGN MARKETS

GREAT BRITAIN

Nov. 19—There is no change in the general situation. Business is still restricted by lack of tonnage and stocks continue excessive. Quotations are approximately as follows:

Best Welsh steam.......	Nominal	Best Monmouthshires. ..	$4.32
Best seconds............	Nominal	Seconds................	4.20
Seconds.................	$4.32	Best Cardiff smalls......	2.64
Best dry coals..........	5.64	Cargo smalls...........	1.68

The prices for Cardiff coals are f.o.b. Cardiff, Penarth, or Barry, while those for Monmouthshire descriptions are f.o.b. Newport, both net, exclusive of wharfage.

Freights—Rates have further advanced for the Mediterranean and the tendency is still upward. Rates are approximately as follows:

Gibraltar.........	$7.08	Naples..........	$11.88	St. Vincent......	$7.80
Marseilles........	10.83	Alexandria......	12.24	River Plate......	9.00
Algiers...........	9.65	Port Said.......	12.24		
Genoa............	11.88	Las Palmas.....	7.20		

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

✚Indicates contracts regarding which official information has been received.

Supplemental Notes

Under this heading additional or supplemental information regarding old contracts appears, together with the page number of the original notice.

1401—New Orleans, La.—Purchases on this contract (p. 447), which provide for furnishing the Robert Werk Pressing Cloth Co. with its annual requirements of coal, involving approximately 300 tons of lump or mine-run, will be confined to the open market because of the unsettled conditions in the coal trade. Address Pres. Robert Werk, Robert Werk Pressing Cloth Co., 2519 St. Phillip St., New Orleans, La.

1451—New Orleans, La.—This contract (p. 530), which provides for furnishing the fuel requirements for the Algiers Distilling Co., will not be negotiated until about the middle of January. Address Purchasing Agent, The Algiers Distilling Co., Brooklyn Ave. and Mississippi Levee, Algiers, La.

✚1598—New Orleans, La.—Bids will be received on this contract (p. 736), until 11 a.m., Dec. 7. The contract provides for furnishing the Public Belt Co. with its annual requirements of coal, involving approximately 8,000 tons of either mine-run, washed nut, slack or washed slack. The bids should be made on the basis of short tons, f.o.b. New Orleans at some point on the Public Belt tracks. All bidders will be required to furnish the Purchasing Committee carload samples to be paid for by the Commission for the purpose of testing. Address Secy. Frank H. Joubert, 6th floor, Municipal Bldg., New Orleans, La.

1635—Denver, Colo.—This contract (p. 870), which provides for furnishing the Post Office at this place with approximately 600 tons of good grade of bituminous lump coal over a 2 in. screen, was bid on as follows, per long ton: Colorado & Utah Coal Co., $4.50; Moffat Coal Co., $4.76; the Great Northern Fuel Co., $4.84; William E. Russell, $4.84; The Colorado Fuel and Iron Co., $4.92; The National Fuel Co., $4.98; The Rocky Mountain Fuel Co., $5.07. Address Custodian B. F. Stapleton, U. S. P. O., Denver, Colo.

1648—Jersey City, N. J.—No bids were received on this contract (p. 871), which provides for furnishing the county institutions with coal. Address Clk. Walter O'Mara, Bd. of Chosen Freeholders, Hudson County, Jersey City, N. J.

New Business

Volume and page number in parenthesis at the end of an item indicate where the previous announcement, bids and awards on that contract may be found.

1685—Cincinnati, Ohio—The Union Central Life Insurance Co. of this place require about 5,000 tons of nut and slack coal, and 200 tons of smokeless coal per annum. Deliveries are made by wagon at the rate of 13 to 15 tons per day. They have a storage capacity of 400 tons, and the next contract will be made Jan. 1. Address Pur. Agt. W. W. McIntyre, Union Central Life Ins. Co., 4 Pine St., Cincinnati, Ohio.

1686—Alton, Ill.—The Alton Steel Hoop Co. at this place has requested bids to cover their fuel requirements during the year beginning Jan. 1. From 250 to 300 tons per week of 1½-in. screenings will be required, and 150 to 250 tons of 3x2-in. or 4x2-in. gas producer coal. The consumption will be dependent on whether the mill is operated single or double turn. Address Secy. M. L. Mozier, The Alton Steel Hoop Co., Alton, Ill.

✚1687—Millvale, Penn.—The local electric light plant at this place usually contracts for their annual fuel requirements involving approximately 30,600 tons of 1¼-in. lump about Jan. 1. The business is let on competitive bids and the approximate price is $2.25 per ton. Address City Clk., Millvale, Penn.

1688—San Antonio, Tex.—The St. Anthony Hotel at this place usually contracts for its annual fuel requirements involving about 40 tons of lignite per month on the first of the year. Address Chf. Engr. Orr, St. Anthony Hotel, San Antonio, Tex.

1689—St. Louis, Mo.—The Standard Stamping Co. at this place is receiving bids for their annual fuel requirements involving four or five cars of lump or egg coal per month. Address Pur. Agt. Porter Wiegand, Standard Stamping Co., St. Louis, Mo.

1690—Bangor, Penn.—The S. Flory Manufacturing Co. usually contracts for their annual fuel supply semi-annually, in January and July. They require about 1,900 tons of bituminous coal and deliveries are made by railroad at the rate of four cars per month. In addition to this they require about three cars of smithing coal per annum, though this is not bought on a contract. The company has storage capacity for 100 tons. Address Pur. Agt. E. G. Markley, The S. Flory Manufacturing Co., Market St., Bangor, Penn.

1691—St. Louis, Mo.—The American Paper Products Co. is in the market for their annual requirements of coal involving approximately 200 tons of Carterville 1½-in. screenings per month. Bids are also being received for furnishing the Carthage, Indiana plant of the company with approximately 1,000 tons per month. Address Pur. Agt. Pollock, American Paper Products Co., St. Louis, Mo.

1692—Battle Creek, Mich.—The Advance Pump and Compressor Co. at this place usually contracts for their annual fuel requirements, involving approximately 400 tons of West Virginia egg coal on Jan. 1. Deliveries are make by railroad at the rate of one car per month, and the company has a storage capacity of 150 tons. Address Purchasing Agent, Advance Pump and Compressor Co., Battle Creek, Mich.

1693—Philadelphia, Penn.—The Industrial Cold Storage and Warehouse Co. at this place contracts for their annual fuel requirements involving approximately 6,000 tons of gas slack on Jan. 1. Deliveries are made by railroad at the rate of 120 tons per week. The company has storage capacity for 360 tons. Address General Manager, Industrial Storage and Warehouse Co., American and Berks St., Philadelphia, Penn.

1694—Philadelphia, Penn.—The Thomas Devlin Manufacturing Co. at this place usually contract for their annual fuel requirements about Jan. 1. The tonnages involved are: Anthracite broken, 3,300; Lykens Valley pea, 1,000; bituminous gas, 4,000; steam, 1,500; 72-hr. coke, 900. Deliveries are made by railroad as required. Address Pur. Agt. H. Drinkhouse, Thomas Devlin Manufacturing Co., 3rd and Lexington Ave., Philadelphia, Penn.

✚1695—Peoria, Ill.—The Elsberry, Missouri, Drainage District is in the market for approximately 1,200 tons of 1½-in. screened lump. About 500 tons will be required soon, and the balance later. Bids will be received until 10 a.m., Dec. 6, and the coal will be bought on a heat unit basis. Address Harman Engineering Co., 144 Fredonia Ave., Peoria, Ill.

✚1696—Elmira, N. Y.—The Water Board will receive bids until 5 p.m., Dec. 14, for furnishing approximately 2,000 tons of bituminous mine-run coal during the year 1916. Smokeless coal is required, and it must not contain more than 25.99% volatile matter. The board contemplates its purchase on a heat unit basis, and an analysis of the coal must accompany each bid, which analysis will be used as the basis for computing the heat value. Address Gen. Mgr. H. M. Beardsley, Water Board, Elmira, N. Y.

1697—St. Louis, Mo.—The Independent Breweries is in the market for coal required at its different plants as follows: American Brewery, 300 to 600 tons of 1¼-in. screening per month; National Brewery, 300 to 600 tons of either Nos. 2, 3, 4 or 5, or mixtures of washed sizes; Columbia Brewery, 500 tons per month of 1½-in. screenings; Empire Brewery, 500 to 600 tons per month of 1½-in. screenings, or Nos. 2, 3, 4, 5 washed or mixed washed sizes; Central Brewery, 500 to 600 tons per month of 2-in. lump, and either Nos. 3, 4, 5 washed or mixed washed sizes; Gast Brewery, 400 tons per month of 2-in. lump, and either Nos. 3, 4 or 5 washed or mixed sizes; Wagner Brewery, 350 tons per month of 1½-in. screenings, and either Nos. 2, 3, 4 or 5 washed or mixed washed sizes.

National, Central, Empire and Wagner Breweries require carload deliveries, and the balance wagon deliveries. Address Pur. Agt., Carl Krausnick, The Independent Breweries, St. Louis, Mo.

1698—Milwaukee, Wis.—When the new city budget goes into effect Jan. 1 the Department of Public Works will advertise for new contracts for furnishing the Menomonee Special Sewerage Pumping Station with approximately 2,000 tons of Pocahontas and mine-run coal. The last previous contract was held by the Milwaukee Western Fuel Co. and at the present time the coal is bought in the open market. Address Chief Clk. Wm. H. Schacht, Jr., Dept. of Public Works, Milwaukee, Wis. (Vol. 7, p. 189.)

+1699—Columbus Grove, Ohio—The Board of Public Works at this place is testing out West Virginia mine-run coal with a view to entering into a contract shortly. They require about one car per week and delivery is made by C. H. & D. R.R. Address Clerk, Board of Public Works, Columbus, Ohio.

1700—Denver, Colo.—The Colorado Packing and Provision Co. at this place consume about 40 tons of coal per day, for which they contract some time in January. Address Purchasing Agent, Colorado Packing and Provision Co., Denver, Colo.

1701—Camden, N. J.—The New York Shipbuilding Co. is in the market for approximately 1,200 tons white ash broken coal, deliveries to be made during 1916. Address Pur. Agt. Leon G. Buckwalter, New York Shipbuilding Co., Camden, N. J.

+1702—Bluffton, Ohio—The Board of Public Affairs at this place is testing out various grades of West Virginia and Ohio coal, preparatory to placing a contract covering their requirements. Address Purchasing Agent, Board of Public Affairs, Bluffton, Ohio.

1703—Miles City, Mont.—Bids were received until Dec. 1 for furnishing coal required at the Carnegie Library during the ensuing year. Deliveries are to be made as required and bidders should specify the grade of coal they propose furnishing and the price. Address Sec. Ida W. Fearnall, Bd. of Trustees, Miles City, Mont.

1704—Norristown, Penn.—Counties Gas and Electric Co. will be in the market about Jan. 1 for their annual supply of broken coal, estimated at from 5,000 to 6,000 tons. Address Pur. Agt. J. A. Pearson, Broad and Arch St., Philadelphia, Penn.

1705—Colorado Springs, Colo.—The Dourte-Hessell Manufacturing Co. at this place will contract about Jan. 1 for their annual fuel requirements, involving approximately 500 tons of slack coal, deliveries to be made at the rate of about 40 tons per month. Address Pur. Agt. W. W. Hassell, Dourte-Hassell Manufacturing Co., Colorado Springs, Colo.

1706—Columbus, Ohio—The John Wildi Evaporated Milk Co. at this place is in the market for approximately 2,500 tons of smokeless or semi-smokeless mine-run coal, for their Bainbridge, N. Y., plant, 2,000 tons for use at Lewisburg, Penn., and 2,300 tons for use at their Troy, Penn., plant. Complete details and specifications may be had on application. Address General Superintendent, John Wildi Evaporated Milk Co., Columbus, Ohio.

1707—Jefferson, Wis.—The Board of Education at this place will receive bids until Dec. 6 for furnishing approximately 150 tons of West Virginia splint, dock screened coal, to be delivered as required at the High School and Public Library. Address Chn. S. E. Waterbury, Bd. of Edu., Jefferson, Wis.

1708—Clearfield, Penn.—The City Council received bids until 7 p.m., Dec. 1, for furnishing coal as may be required for the hose houses in the Second, Third and Fourth wards. Address Sec. J. D. Connelly, City Council, Clearfield, Penn.

1709—Denver, Colo.—The Three Forks Portland Cement Co. are in the market for one carload of Pennsylvania blacksmith coal. Quotations should be made f.o.b. Trident, Mont. Address Sec. and Gen. Mgr. R. J. Morse, 508 Ideal Bldg., Denver, Colo.

1710—Cleveland, Ohio—T. P. Jones, fuel agent at this place, is in the market for 200 cars of West Virginia slack, or nut and slack coal, deliveries to be made at the rate of two cars per day beginning immediately. Address T. P. Jones, Fuel Agt., Cleveland, Ohio.

1711—Cumberland, Md.—The Allegheny County Commissioners will receive bids until noon, Dec. 7, for furnishing and delivering coal as may be required during the ensuing year in the bins of the court house and jail, and in carload lots on Payne Spring siding for the Insane Asylum and County Home. Bidders must specify what mine they propose furnishing the coal from. Address Clk. Angus Ireland, Allegheny County, Cumberland, Md.

Contracts Awarded

Note—Successful bidders are noted in **bold face** type.

+1439—Muscatine, Iowa—This contract (p. 490), which provides for furnishing and Muscatine-Louisa Drainage District, No. 13, with approximately 200 tons of soft lump coal, has been awarded to **W. G. Block & Co.** Four bids were submitted. Address Audr. H. C. Shoemaker, Muscatine, Iowa.

+1442—Crookston, Minn.—This contract (p. 490), which provides for furnishing the Polk County Court House with 160 tons of Hocking Valley mine-run coal, was awarded to **S. W. Vance & Co.**, of Crookston, at $6 per ton. Deliveries to be made as required and to be concluded before next spring. Address Audr. H. J. Welte, Polk County, Crookston, Minn.

1446—Mauch Chunk, Penn.—This contract (p. 490), which provides for furnishing the Borough School Board with coal has been awarded as follows: **H. A. Butler & Co.**, 60 tons of chestnut for the Asa Packer Building at $5.40 per ton; **Lehigh Coal and Navigation Co.**, 75 tons of pea for the First Ward Building, at $3.60 per ton. Address Secy. C. S. Weiler, School Bd., Mauch Chunk, Penn.

+1461—Albia, Iowa—This contract (p. 530), which provides for furnishing the several buildings of the Independent School District with coal, has been awarded to **Hammond & Moss** at $2.30 per ton for clean lump coal. A small quantity of steam coal will also be required which is now being bought in the open market at $1.50 per ton. There were four additional bids submitted on the contract for the lump coal ranging from $2.30 to $3 per ton. Address Secy. C. W. Smallwood, Independent School Dist., Albia, Iowa.

+1463—Little Falls, Minn.—This contract (pp. 530, 870), which provides for furnishing the City Government with approximately 50 tons of Youghiogheny coal, was divided equally between **W. H. Ryan** and **Julius Zetka.** Address Comr. H. J. Lafond, Little Falls, Minn.

+1469—Warren, Minn.—This contract (p. 531), which provides for furnishing the Marshall County Court House with approximately 125 tons of Youghiogheny screened lump coal, has been awarded to **Knutson & Holson**, at $5.62 per ton, delivered. Address Audr. A. G. Lundgrem, Warren, Minn.

+1478—Jamesburg, N. J.—This contract (p. 531), which provides for furnishing the New Jersey State Home for Boys with approximately 3,500 tons of buckwheat and 100 tons of stove coal, has been awarded to **Miles Ross & Sons.** Address Supt. Richard J. Drever, New Jersey State Home for Boys, Jamesburg, N. J.

+1490—Leetonia, Ohio—This contract (p. 576), which provides for furnishing the local water works with coal required during the ensuing year has been reawarded to **F. J. Neiheisel** at $2 for lump, $1.80 for mine-run and $1.10 for slack. This contractor has had this business for several years. Only one other bid was received on the business. Address Secy. Jacob Kuegle, Bd. of Pub. Affairs, Leetonia, Ohio.

1507—New Orleans, La.—This contract (p. 577), which provides for furnishing the fuel requirements for the Dixie Laundry Co., has been awarded to the **C. A. Andrews Coal Co.** Address Sec.-Treas. Max N. Kohler, Dixie Laundry Co., 1124 Tulane Ave., New Orleans, La.

1551—East St. Louis, Ill.—This contract (pp. 660, 828), which provides for furnishing Swift & Co. with approximately 120 tons of 1½-in. or 2-in. screenings per day, was awarded to the **Breese Trenton Mining Co.** It is understood the contract will run until Mar. 31, 1917, and that the price was 50c. per ton f.o.b. cars at the mines. Address H. C. Huggins, Swift & Co., East St. Louis, Ill.

1574—New Orleans, La.—This contract (p. 699), which provides for furnishing the International Distillery Co. with approximately 350 tons of coal, deliveries to be made during the next year, has been awarded to the **C. A. Andrews Coal Co.** Address Pur. Agt. Kern, International Distillery Co., Pine and Ferdinand St., New Orleans, La.

1576—New Orleans, La.—This contract (p. 700), which provides for furnishing the Lane Cotton Mills with approximately 50 cars of steam coal, has been closed with a New Orleans concern until next May. Address Pur. Agt. R. Lecorgne, Lane Cotton Mills, 434 Cadiz St., New Orleans, La.

1579—New Orleans, La.—The award on this contract (pp. 700, 829), which provides for furnishing the Cosmopolitan Hotel with approximately 120 tons of coal per month, was made to the **Darsam Bros. Coal Co.** Address Pur. Agt. Major Stewart, Cosmopolitan Hotel, 120 Bourbon St., New Orleans, La.

1589—St. Louis, Mo.—This contract (p. 736), which provides for furnishing the Liggett & Myers Tobacco Co. with its annual requirements of coal, involving approximately 2,000 tons of either 1½-in. screenings or No. 5 washed slack per month, has been awarded to the **Consolidated Coal Co.** The contract is to run for one year from date. Address Gen. Mgr. R. D. Lewis, Liggett & Myers Tobacco Co., St. Louis, Mo.

+1600—Warrensburg, N. Y.—This contract (p. 736), which provides for furnishing the fuel requirements for School District No. 1, during the ensuing school year, has been awarded to **A. C. Emerson & Co.,** who were the lowest bidders. Address Secy., Board of Education, Union Free School District, No. 1, Warrensburg, N. Y.

+1612—Aliquippa, Penn.—This contract (p. 786), which provides for furnishing the Village Government with approximately 500 bu. of 1¼-in. bituminous lump coal, has been awarded to **J. A. Barto** at 9⅜c. per bu. Address Secy. L. S. Patton, Municipal Bldg., Aliquippa, Penn.

+1616—Houston, Tex.—This contract (p. 786), which provides for furnishing the winter supply of coal to the Harris County institutions known as the Boys' School at South Houston and the Harris County School for Girls at Bellaire, was awarded by the Harris County Board of Commissioners on Nov. 10 to **Ed Sacks,** of Houston, on the following basis: McAlester nut coal, f.o.b. South Houston, $5.20; f.o.b. Bellaire, $6.85. Other bids submitted were: Richard Cocke & Co., f.o.b. South Houston, $9; Bellaire, $11.50; Sampson & Beardon, South Houston, $5.75; Bellaire, $8.50; Houston Wood and Coal Co., South Houston, $5.25; Bellaire, $8; Rice & Coles, South Houston, $5.30; Bellaire, $6.60; Crystal Ice and Coal Co., South Houston, $10.25; Bellaire, $10.25; Richey Wood Co., South Houston, $10.50; Bellaire, $12. Address County Audr. H. L. Washburn, Houston, Tex.

1618—St. Louis, Mo.—This contract (p. 786), which provides for furnishing the St. Louis Dressed Beef and Provision Co. plant with approximately 100 tons per day of 1½-in. screenings, has been awarded to the **Bickett Coal and Coke Co.** The contract is to run for one year. Address Pur. Agt. J. M. Weiser, 3919 Papin St., St. Louis, Mo.

1625—Marshall, Minn.—This contract (p. 828), which provides for furnishing the local city power plant with approximately 1,800 tons of coal, has been awarded to the **Marshall Milling Co.** at 75c. per ton for Franklin County 2-in. screenings f.o.b. Marshall. Address Rec. T. L. Bumford, Marshall, Minn.

1627—Belfield, N. D.—This contract (p. 828), which provides for furnishing the local Court House with coal as may be required during the ensuing year, has been awarded to **A. A. Dinsdale** at $2.90 per ton for lignite coal. Address County Audr. J. L. Hughes, Belfield, N. D.

1632—Greenville, Ohio—This contract (p. 828), which provides for furnishing the Darke County Board of Commissioners with approximately 100 tons of Pocahontas lump coal for delivery on cars, P. C. C. & St. L. sidetracks at Greenville, has been awarded to **M. A. Maher** at $3.50 per ton for 2-in. screenings. Address Clk. G. H. Garrison, Darke County Board of Comrs., Greenville, Ohio.

+1633—New York, N. Y.—This contract (pp. 828, 911), which provides for furnishing the Central Purchasing Committee with approximately 10,000 tons of anthracite and bituminous coal for various city departments, has been awarded as follows, per gross ton: Zone 1, **Bacon Coal Co.,** $3.38; Zone 7, **C. H. Reynolds & Sons,** $3.25; Zone 9, **Bacon Coal Co.,** $5.40; Zone 11, **Jamieson & Bond Co.,** $7.85; Zone 17 Class "B," **John E. Donovan,** $7.10; Zone 18, Class "B," 300 and 1,000 tons, **William Farrell & Son,** $3.99 and $2.12 respectively; Zones 1 to 17 inclusive, tonnages of 100, 75, 150, and 50, **F. M. A. Leach,** $6.85, $6.85, $7.20 and $8.10 respectively and same zones tonnage of 25 tons to **S. Haber** at $6.95. Bid on Zone 8 was rejected while bids on Zones 3 and 17, Class "A," and Zone 18, Class "A," are still under consideration, tests being made of the coal offered. Address, Central Pur. Com., Room 1126, Municipal Bldg., New York City. (No. 706, Vol. 7, p. 915).

+1637—Philadelphia, Penn.—This contract (p. 870), which provides for furnishing the Philadelphia County prison with approximately 2,000 tons of buckwheat, has been awarded to **William Bryant** on Lykens Valley buckwheat, at $3.30 per gross ton, delivered at Holmesburg Prison and $4.23 at the Reed St. Prison. This company was also awarded contract for 100 tons of white ash stove at $5.78 for delivery at Holmesburg and $6.88 at Reed St. Address Supt. Frederick A. Cooke, 10th and Reed St., Philadelphia, Penn.

+1642 Bayonne, N. J.—This contract (p. 870), which provides for furnishing approximately 200 tons of anthracite egg and stove coal to the various fire houses and police headquarters, has been awarded to **Wm. Laubenheimer,** at $5.49 per ton. Address, City Clk. Wm. P. Lee, Bd. of Comrs., Bayonne, N. J.

1644—Maryland, N. Y.—This contract (p. 870), which provides for furnishing the Union Free School District No. 2 with one carload of stove coal, has been awarded to **Platt & Howland** at $6 per ton. J. B. Murdock bid $6.25. Address Clk. R. B. Safford, Union Free School Dist. No. 2, Maryland, N. Y.

+1646—Media, Penn.—This contract (p. 870), which provides for furnishing the City Government with approximately 200 tons of Lykens Valley pea coal, has been awarded to the **Philadelphia & Reading Coal and Iron Co.** at $2.50 per gross ton at the mines. Address Clk. Ed. Minton, Media, Penn.

1684—Salt Lake City, Utah—This contract (p. 912), which provides for furnishing the Board of Education with approximately 5,000 tons of slack and 500 tons of lump and nut coal, has been awarded to the **Bamberger Coal Co.** at $2.45 for slack and to the **Parrott Coal Co.** at $4.65 for nut and $5.20 for lump coal. The prices include delivery at the schools. Most of the bids submitted on this business were at the regular circular prices of $5.25 for nut and $5.75 for lump, though a few other bids were received at somewhat less, which is distinctly contrary to the experience in former years. The slack coal will be furnished from Wyoming mines and the lump and nut from the Utah mines. There were 13 bidders altogether on the contract. Address Clk. L. P. Judd, Bd. of Edu., Room 202 City and County Bldg., Salt Lake City, Utah.

Contract Notes

Somersworth, N. H.—The Great Falls Woolen Co. consumes about 600 tons of bituminous coal per annum.

St. Louis, Mo.—The Terminal Railroad, one of the largest coal consumers here is confining its purchases to the open market.

Cincinnati, Ohio—The E. L. Sternberger Coal Co. have contracted for the entire output of the **Eastern Kentucky Coal Co.,** whose operations are at Torch Light, Ky.

Auburn, Me.—The contract for furnishing the local Post Office building with 40 tons of New River mine-run coal has been awarded to **Pulsifer & Young** at $212. Address Postmaster Alfred T. Hicks, Auburn, Me.

Atlanta, Ga.—The Atlanta Hosiery Mills consumes approximately 400 tons of nut and slack coal per annum, deliveries being at the rate of 30 tons per month. Address Pur. Agt. Atlanta Hosiery Mills, Atlanta, Ga.

Cavendish, Vt.—Gay Bros. Co. consume about 800 tons of lump coal per annum. Deliveries are made by railroad and they have a storage capacity for 700 tons. Address Pur. Agt. J. E. Gay, Gay Bros. Co., Cavendish, Vt.

Bridgeton, R. I.—W. H. Prendergast, manufacturer at this place, consumes about 700 tons of bituminous coal per annum. Deliveries are made by railroad in carload lots. The company has a storage capacity for 100 tons.

Ardmore, S. D.—The contract for furnishing the County Government with coal during the ensuing year has been awarded to **Mosher & Kime** at $5.25 per ton for egg coal. Address County Audr. D. K. Batchelor, Ardmore, S. D.

St. Louis, Mo.—The contract for furnishing the National Lead Co. with the coal supply for its plant at Howards Station during the period ending Mar. 31, 1916, has been awarded to the **Big Muddy Coal and Iron Co.,** on Big Muddy screenings.

Philadelphia, Penn.—The contract of the Pecora Paint Co. (p. 829), involves from 600 to 1,000 tons of anthracite coal instead of 600 tons as previously noted. Address Pur. Agt. F. B. Bowen, Pecora Paint Co., 4th and Venango St., Philadelphia, Penn.

St. Louis, Mo.—The contract for furnishing the Wrought Iron Range Co. with approximately 150 tons of 2-in. screened lump coal has been awarded to the **Donk Bros. Coal and Coke Co.** Address Pur. Agt. Kalbfleisch, Wrought Iron Range Co., St. Louis, Mo.

Fall River, Mass.—The Osborn Mills at this place consume approximately 4,800 tons of bituminous and 700 tons of anthracite coal per annum. Deliveries are made by wagon from the dock. Address Pur. Agt. James T. Miller, Osborn Mills, Fall River, Mass.

Granite City, Ill.—The National Stamping and Enameling Co. will, on Friday of each week, purchase their requirements for the ensuing week; 1½-in screenings are used. Address Pur. Agt. R. C. Lutten, National Stamping and Enameling Co., Granite City, Ill.

Philadelphia, Penn.—The Philadelphia Grain Elevator Co. purchase about 120 tons of anthracite pea coal per annum. Delivery is made by Philadelphia & Reading R.R. Address Purchasing Agent, Philadelphia Grain Elevator Co., 20th and Hamilton St., Philadelphia, Penn.

St. Louis, Mo.—The contract for supply the Banner Buggy Co. and the Chevrolet Manufacturing Plant now under construction, has been awarded to the **Lumaghi Coal Co.** on 2-in. shaker screened coal. Address Pur. Agt. R. M. Taylor, Banner Buggy Co., St. Louis, Mo. .

St. Louis, Mo.—The contract for furnishing the Buck Stove and Range Co. with approximately 200 tons of 1½-in screenings per month has been awarded to the **Lumaghi Coal Co.** on their "Black Brier" coal. Address Chief Engr. Dix, Buck Stove and Range Co., St. Louis, Mo.

Shelbyville, Ill.—The contract for furnishing the City Water Works with approximately 130 tons per month of 1½-in. screenings, has been awarded to the **Lumaghi Coal Co.** on their "Black Brier" coal. Address Mgr. and Pur. Agt. C. E. Chester, City Water Works, Shelbyville, Ill.

St. Charles, Mo.—The contract for furnishing the St. Charles Milling Co., with approximately 60 tons of 2-in. screened coal per month, was awarded to the **Lumaghi Coal Co.** on their "Cantine" coal. Address Pres. and Pur. Agt. J. H. Werner, St. Charles Milling Co. St. Charles, Mo.

Cincinnati, Ohio—It is reported that the contract of the Philip Carey Manufacturing Co., involving approximately 12,000 tons of nut and slack coal for their Lockland plant has been awarded to the **Middle West Coal Co.** Address Pur. Agt. Philip Carey Manufacturing Co., Cincinnati, Ohio.

Hermann, Mo.—The contract for furnishing the Hermann Ferry and Packet Co. with approximately 60 tons of 6-in. lump coal per month has been awarded to the **Lumaghi Coal Co.** on its "Black Brier" coal. Address Secy. and Pur. Agt. Fred. Lang, Hermann Ferry and Packet Co., Hermann, Mo.

Philadelphia, Penn.—E. E. Brown & Co., Inc. consume about 400 tons of buckwheat coal per annum. The company does not contract. Deliveries are made by railroad at the rate of about one car per month. Address Pur. Agt. E. E. Brown & Co., Inc., McKearney and Meadow St., Philadelphia, Penn.

Haliock, Minn.—The contract for furnishing the County Board with coal during the ensuing year has been awarded to the **St. Anthony & Dakota** and **St. Hilaire** companies, at $10.25 for anthracite and $7.25 for bituminous, including delivery. Address County Audr. James Davnie, Hallock, Minn.

St. Louis, Mo.—The contract for furnishing the Johnston Tinfoil and Metal Co. with their fuel requirements involving approximately 155 tons per month has been awarded to the **St. Agnes Coal Co.** on Carbon lump. Address Treas. and Pur. Agt. F. H. Penney, Johnston Tinfoil and Metal Co., St. Louis, Mo.

New Britain, Conn.—Beaton & Cadwell Mfg. Co., at this place, consume approximately 200 tons of steam coal per annum. They have storage capacity for 40 tons, and deliveries are made by railroad at the rate of one car every six weeks. Address Purchasing Agent, W. H. Cadwell, New Britain, Conn.

Woonsocket, R. I.—The Guerin Spinning Co. at this place consumes approximately 1,500 tons of coal per annum. They have a storage capacity for 500 to 600 tons, and deliveries are made by wagon at the rate of two to three cars at a time. Address Pur. Agt. Ballon, Guerin Spinning Co. Social St., Woonsocket, R. I.

St. Louis, Mo.—The contract for furnishing the William's Patent Crusher and Pulverizer Co. with about 90 tons of 6x3-in. egg coal per month has been awarded to the **Big Muddy Coal and Iron Co.**, on their Herrin No. 6 coal. Address Pur. Agt., W. J. Hanson, William's Patent Crusher and Pulverizer Co., St. Louis, Mo.

Buffalo, N. Y.—The Ericsson Mfg. Co., consumes about 1,200 tons of three-quarter Youghiogheny coal per annum. Deliveries are made by railroad and at the rate of one car per week during the winter months. They have a storage capacity of 250 tons. Address Pur. Agt. H. R. Dilks, Ericsson Mfg. Co., Buffalo, N. Y.

Columbus, Ga.—George O. Berry, at this place, purchases approximately 5,000 tons of washed nut and mine-run coal per annum, deliveries being made by railroad at the rate of 400 to 500 tons per month. The company has storage capacity for 300 tons. Address Pur. Agt. F. E. Berry, care of George O. Berry, Box 5, Columbus, Ga.

Fall River, Mass.—The Richard Borden Manufacturing Co., at this place consume approximately 8,500 tons of Pocahontas coal delivered by water to the city, and by wagon to the point of consumption at the rate of approximately 28 tons per day. Address Purchasing Agent, Richard Borden Manufacturing Co., Fall River, Mass.

Philadelphia, Penn.—The Bradford Mills at this place consume about 6,000 tons of bituminous coal per annum. They have storage capacity for 900 tons, and deliveries are made by Philadelphia & Reading Ry. at the rate of about three cars per week. Address Pur. Agt., M. A. Spencer, Bradford Mills, 28 N. Front St., Philadelphia, Penn.

Granite City, Ill.—The contract for furnishing the Western Fire Brick Co. with its fuel requirements involving approximately 175 tons per month of 1½-in. or 2-in. screenings. has been awarded to the **Borders Coal Co.** on Franklin 2-in. screenings. Address Gen. Mgr. and Pur. Agt. George Hanlon, Western Fire Brick Co., Granite City, Ill.

St. Louis, Mo.—The contract for furnishing the Reliance Buggy Co., with its fuel requirements during the coming season, involving approximately 300 tons of Nos. 2 or 3 washed nut coal per month, has been awarded to the **Southern Coal, Coke and Mining Co.** Address Gen. Mgr. P. E. Ebrenz, Reliance Buggy Co., St. Louis, Mo.

St. Louis, Mo.—The contract for furnishing the New National Oil Cloth Co. with its annual fuel requirements, involving approximately 60 tons of mine-run coal per week, has been awarded to the **Lumaghi Coal Co.** on their Black Brier Southern Illinois coal. Address Genl. Mgr. and Pur. Agt. Wm. Oepts, New National Oil Cloth Co., St. Louis, Mo.

Findlay, Ohio—The contract for furnishing the Findlay Water Works with approximately 2,000 tons of coal during the ensuing year has been awarded to the **Sunday Creek Coal Co.** at 85c. per ton f.o.b. mines. It is understood the contract will be filled on Smithers Creek mine-run coal. Address Purchasing Agent Findlay Water Works, Findlay, Ohio.

Ensley, Ala.—The Bessemer Fire Brick Co., at this place, consume approximately 12,000 tons of mine-run coal per annum. Deliveries are made by railroad, at the rate of 250 tons per week, and the company has storage capacity for 500 tons. The coal is bought in the open market. Address Pur. Agt. J. W. Minor, Bessemer Fire Brick Co., Ensley, Ala.

St. Louis, Mo.—The contract for furnishing the Curtis Manufacturing Co. with approximately 125 tons per week of No. 2 washed nut coal for power use has been awarded to **Southern Coal, Coke and Mining Co.** Oil was recently substituted for coal at this plant for the purposes of annealing. Address Pur. Agt. John A. A. Hecker, Curtis Manufacturing Co., St. Louis, Mo.

Philadelphia, Penn.—Smith, Kline & French Co., at this place, consumes about 2,500 tons of Highland buckwheat coal per annum. Deliveries are made by railroad at the rate of about one 45- to 50-ton car per week, and the company has storage capacity for 75 tons. Address Pur. Agt. W. G. McHenry, Smith, Kline & French Co., 35 Poplar St., Philadelphia, Penn.

St. Louis, Mo.—The contract for furnishing the Railway Exchange Bldg. with from 100 to 200 tons per day of 1½ in. screenings delivered in wagon-load lots, has been awarded to the **Polar Wave Ice and Fuel Co.** It is understood the contract will be filled on Carterville (Southern Illinois) coal. Address Pur. Agt. Ziegenfiss, Railway Exchange Bldg., St. Louis, Mo.

Chattanooga, Tenn.—The Southern Clay Manufacturing Co. consumes about 20,400 tons of No. 2 mine-run, nut and slack at the Tennessee plant, and about 10,100 tons of the same at the Alabama plant. Deliveries are made by rail and wagon at the rate of approximately 2,500 tons per month. Address Pur. Agt. W. C. Brown, Southern Clay Manufacturing Co., 707 James Bldg., Chattanooga, Tenn.

St. Louis, Mo.—The contract for furnishing the Walsh Fire Clay Products Co. with approximately 1,000 tons per month of 2-in. screened lump coal has been awarded to the **Big Muddy Coal and Iron Co.** The coal for the Vandalia, Mo., plant of the Fire Clay Co. is being supplied under contract by the Mount Olive and Staunton Coal companies. Address Pur. Agt. Parker, Walsh Fire Clay Products Co., St. Louis, Mo.

Waterloo, Iowa—The Waterloo, Cedar Falls & Northern Ry. consume approximately 30,000 tons of Iowa screenings, 1,500 tons of Illinois lump and 150 tons of anthracite nut coal per annum. Deliveries are made by railroad at the rate of 600 tons per week, and the company has storage capacity for 1,000 tons. The company has a three-year contract, which expires Apr. 1, 1918. Address Pur. Agt. F. McDonald, Waterloo, Cedar Falls & Northern Ry., Lafayette Bldg., Waterloo, Iowa.

Italy—A prominent Italian business firm, having large connections, desires to represent a coal company that is in a financial position to fulfil its contracts, and has a quality of coal required on that market. They would have to be in a position to compete with the leading American exporters, as on equal terms the correspondent asserts he can always secure the business. Bidders must cut prices to the very lowest point calculating a commission of 10c. per ton on that side. It is absolutely essential that they offer c.i.f. prices west coast of Italy. The above mentioned competitors have often been able to do so. For additional particulars address the Market Editor, "Coal Age."

COAL AGE

Vol. 8 NEW YORK, DECEMBER 11, 1915 No. 24

Coal Mining and Water

OWNERS of coal mines in their anxiety to save on operating costs often center their gaze far off when matters of moment are close at hand. *For example,* there is the question of water, which is an everyday problem at eight out of ten mines. Call in the mine manager or superintendent and say to him:

> *You know how many tons of water are raised at your mine for every ton of coal hoisted.*
>
> *You also know your cost for power per horsepower per year.*

But—

Do you know how much of the total water pumped is surface water which can be prevented from entering your mine?

Do you know the size of stream which, if allowed to run into the mine workings, will give you 10,000 gallons in 24 hours?

Do you know what horsepower is required to pump 10,000 gallons from your mine?

Do you know whether or not the waste water from your power plant is drained safely away, or does it soak into the ground and ultimately enter the mine?

Do you know if the brooks and streams are diverted or carried safely across your broken ground?

Do you know how many little streams of 10,000 gallons per 24 hours you may stop from entering your mine?

* * *

IF your manager or superintendent is unable to answer the foregoing questions, he is either "asleep at the switch," or he is a low-power official in a land of many hills. While you are waking him up or hunting for a substitute, GO OVER THE GROUND *overlying your mines with your chief engineer, and if you find that you cannot spend some money in drainage, etc., that will pay a larger dividend on each dollar so invested than you are paying to your stockholders, sign your name* COAL OPERATOR UNIQUE.

The Storage of Coal--I

By John B. C. Kershaw*

SYNOPSIS—This is the first of three articles on the subject of coal storage. The text of this initial installment deals particularly with the chemical and physical constitution of coal. The author states that the percentage of volatile matter yielded by a fuel is no guide to its inflammability. A method of determining the relative proportions of readily decomposed constituents in different coals is given.

The storage of coal is a subject that has attracted considerable attention in recent years. The dangers that attend any lengthened interference with the mainspring of the national position and wealth or with the supplies of the chief raw material of the transporting and manufacturing industries have been brought home to us in recent years by serious labor disputes and strikes in the coal-mining districts of the world. As a result of these disturbances, it has become a fixed policy on the part of those in charge of railway and transport services, electric-light and power plants, gas-works, water works and all large manufacturing undertakings to carry large stocks of coal, in order to be prepared for any emergencies that may arise.

A great variety of methods and many different types of stock heaps and storage bins have been tried for this purpose. The problem is not as simple as it would be if the material to be stored underwent no physical or chemical changes in the process. Nearly all coals deteriorate rapidly under certain conditions of storage and exposure, and there are the further dangers of heating and spontaneous combustion to which certain classes of coal are specially liable. The problem of coal storage is therefore intimately associated with the chemical constitution of coal and with the changes that occur in it when heated, and the subject cannot be dealt with adequately unless this side of the problem is carefully studied and discussed.

In these articles I intend to approach the subject first from the theoretical and then from the practical standpoint. It is hoped that this discussion of the question of coal storage may prove of value to all who already have large stocks of fuel under their care or who contemplate forming such stock heaps in the near future.

The Constitution of Coal

All naturally occurring solid fuels are modifications of cellulose or woody fiber brought about by great pressure and heat in the strata of the earth's crust. Cellulose, which may be regarded as the raw material of coal, contains carbon, hydrogen and oxygen and is represented by the chemical formula $C_6H_{10}O_5$. It contains 44 per cent. of carbon by weight.

The process of conversion of cellulose into the various classes of solid fuel with which we are familiar has been accompanied by a gradual escape of the hydrogen and oxygen which make up 56 per cent. of its weight and by a gradual increase in the density and hardness of the product. The following table gives the relative percentages of hydrogen, oxygen, nitrogen and carbon in the more commonly occurring solid fuels found in the earth, and it is interesting to note the gradual increase in the density of the fuel and in the percentage of carbon as one gets deeper and deeper into the bowels of the earth and farther away from the present geological epoch of time.

TABLE 1. SUCCESSIVE STAGES OF CHANGE IN THE FORMATION OF SOLID FUELS

	Carbon, %	Nitrogen and Oxygen, %	Hydrogen, %
Wood (cellulose)	44	50	6
Peat	60	34	6
Brown coal (lignite)........	67	27	6
Bituminous coal	85	8	5
Semianthracite or steam coal	88	6	4
Anthracite	94	2½	1½

Note—Ash is deducted in all the above tests, and the percentages are calculated on the ash-free fuel.

Geologists assert that anthracite is the oldest of the naturally occurring solid fuels, and it is believed that many thousands of years have elapsed since those strata of the earth above which the anthracite is found were on the earth's surface and covered with swamps and vegetation.

The differences between the various classes of solid fuel can be most easily noted by heating strongly (to a red heat) one gram of the powdered fuel in a closed platinum crucible with a tightly fitting lid. The older anthracite and the semianthracite (or steam coals) give off only comparatively small amounts of hydrocarbon vapors; the bituminous and "cannel" coals swell up and yield one-third or more of their weight of volatile matter which burns with a luminous flame as it escapes from the crucible. The residue that remains in the crucible after these volatile constituents of the fuel have been driven off is composed of fixed carbon plus the mineral constituents of the fuel; and from the physical character of this coke the class to which the fuel belongs may be determined. The following table gives average figures for the approximate analysis of the various classes of fuel:

TABLE 2. APPROXIMATE COMPOSITION OF TYPICAL FUELS

Class	Coke, %	Fixed Carbon, %	Volatile %	Ash, %
Anthracite	96	93	4	3
Steam coals	88	78	12	10
Bituminous coal	67	57	33	10
Peat	32	30	68	2

It must be remembered that the carbon, hydrogen, oxygen and nitrogen are present in the natural solid fuel in forms of combination that have not yet been fully investigated and that the gaseous and solid products obtained on heating coal are "decomposition products."

According to Wheeler, coal may be regarded as a conglomerate of two main types of compound. One of these on heating to a comparatively low temperature yields inflammable gases and vapors, while the other class requires a higher temperature and prolonged heating to decompose it. In a paper contributed to the Chemical Society, London, in 1911, Wheeler and Burgess described an apparatus and method by means of which they had been able to collect separately the whole of the gases evolved from different samples of coal at different stages in the heating process.

---

*Liverpool, England.

They had previously shown that a compound existed in coal which decomposed rapidly at a temperature lying between 700 deg. C. and 800 deg. C. and yielded hydrogen as its principal gaseous product. At the same time it was evident that at lower temperatures of distillation the paraffin hydrocarbons, and not hydrogen, were the chief products; and it seemed reasonable to suppose that the difference was due principally to the temperature at which decomposition was effected.

From the results given in a later paper by the same author, it is apparent that coal contains a compound of less stability to the action of heat and that this less stable compound yields the paraffins as its gaseous decomposition products. Thus they find that the paraffin hydrocarbons form by far the largest proportions of the first gases evolved at temperatures either above or below the "critical period" of decomposition. At temperatures below the critical period, during the first few seconds of heating, 1 or 2 per cent. of hydrogen at most is evolved.

Presumably, therefore, coal contains two types of compounds of different degrees of ease of decomposition—the one, the more unstable, yielding the paraffin hydrocarbons and no hydrogen; the other, decomposed with greater difficulty, yielding hydrogen alone as its gaseous decomposition product.

There seems therefore to be considerable justification according to Wheeler and Burgess for assuming that one type of compound in coal, and the most important type, is a degradation product of cellulose. This type, from preliminary experiments the authors have made on the destructive distillation at high temperatures of pure cellulose and oxycellulose, is identified with the "hydrogen-yielding constituents" indicated by their experiments with coal. The "paraffin-yielding constituents" are most probably derived from the resins and gums originally contained in the sap of the coal plants, and these form the "cement" of a conglomerate of which the cellulose derivatives are the base.

Inflammability of Dust

A property common to all coals is their inflammability when in the form of dust, and in a third paper communicated to the Chemical Society, London, in 1913, Wheeler gives details of an investigation carried out by him in 1911-1913 to prove that the percentage of volatile matter yielded by a fuel is no guide to its inflammability. That there should be no relationship between the inflammability of different coal dusts and their contents of volatile matter as determined in the usual manner is not surprising. The determination of volatile matter simply consists in heating the coals to a high temperature and in driving off the gases that can be driven off at that temperature. Such a process can make no distinction between substances of different ease of decomposition that may be present in the coal, for it decomposes them all; nor can it offer any information regarding the proportions in which such substances may exist in different coals.

It was necessary in Wheeler's investigation to obtain some means of determining the relative proportions of readily decomposed constituents in different coals. The method employed was to measure the volumes of paraffins evolved per gram of the ash-free dry coals on heating them in a vacuum at 650 deg. C. A more readily applied method is that of determining the percentages of the coals extractable by pyridine. The extraction with pyridine was carried out on from 3 to 10 grams of the dried and sieved coal dust in a Soxhlet fat-extraction apparatus. Some coals were attacked by pyridine much more rapidly than others, a dark burnt-amber color being imparted to the liquid in contact with the coal.

Such coals usually, but not always, contained a high percentage of extractive matter. Other coals gave to the pyridine a light raw-sienna color, the solution being highly fluorescent; these coals yielded between 20 and 25 per cent. of their weight to solution in pyridine. This extraction does not effect a complete separation of the resinous ("paraffin-yielding") from the humus ("hydrogen-yielding") constituents, but inasmuch as all that requires to be known is the relative proportions of the former in a number of coals, for comparison with their relative inflammabilities, complete separation was not necessary. We may therefore according to Wheeler take the percentage extractable by pyridine as affording a rough measure of the relative proportions of readily decomposed constituents in the coals experimented with. The following table, giving some of Wheeler's results, has been compiled from the figures given in his Chemical Society paper of 1913:

TABLE 3. PYRIDINE EXTRACTIONS OF COALS COMPARED WITH THE RESULTS OF THEIR APPROXIMATE ANALYSES AND RELATIVE INFLAMMABILITIES

Relative Inflammability, Deg. C.	Pyridine Extraction, %	Volatile Matter, %	Fixed Carbon, %	Ash, %
995	38.8	32.7	60.8	4.5
1005	37.9	30.6	64.7	4.1
1015	36.2	35.7	60.0	2.2
1020	34.9	31.6	62.7	4.8
1025	34.7	31.4	64.3	2.8
1035	29.7	35.0	62.0	1.2
1045	27.9	32.4	63.1	2.5
1055	28.0	33.5	59.7	4.6
1065	28.1	30.8	64.6	4.1
1075	26.4	32.8	56.4	4.1
1095	18.0	25.0	71.1	3.6

A similar investigation relating to the ultimate constitution of coal by means of solvents has been carried out in the United States by Parr and Hadley, and the results have been published by the University of Illinois in Bulletin No. 76, Nov. 1914.

Results of an Important Investigation

The authors' summary of their results and conclusions, which support those of Wheeler, is as follows:

1. A study of solvents for the purpose of subdividing coal constituents without decomposition was carried out. Phenol was adopted as the most active solvent for the purpose of the investigation. 2. An apparatus was devised for carrying out the extraction so that the temperature of the phenol would be above 110 deg. 3. The application of the method to different types of coal showed that coal varied widely in the amount of material dissolved by phenol. The amount of soluble material seemed to differentiate sharply between subdivisions of coal types. On the ash and moisture-free basis the high volatile coals of Vermilion County, Illinois, give 35 to 40 per cent. of soluble material, the coals from Madison and Montgomery Counties in the same state give 30 to 35 per cent. and the low volatile coals of Williamson County, Illinois, show 20 to 30 per cent. of soluble material. 4. Extraction of coal leaves a residue which will not coke. The coking constituent of the coal is in the extract. 5. Residue and extract oxidize at room temperatures, and more readily at 100 deg., the rate of oxidation being more rapid in the residue. 6. Residue and extract possess an avidity for water as well as for oxygen at ordinary temperatures. The residue shows the

greater avidity in both cases. 7. Volatile matter determinations show that the extract contains more volatile matter than the residue. 8. The ultimate analysis of the coal, residue and extract shows that the percentage composition of carbon, hydrogen, nitrogen and oxygen is substantially the same. 9. Destructive distillation of the coal residue and extract gave gases of practically the same composition. 10. Oxidation of the coal residue or extract produces a lowering in the percentage of volatile matter. 11. Oxidation decreases the amount of material which may be extracted from coal by phenol, and the coking properties are also decreased in proportion to the extent of the oxidation. 12. Oxidation of the coal, residue and extract is shown by the increase in the percentage of carbon dioxide in the gases produced by thermal decomposition. It is concluded, therefore, that the oxygen absorbed is chemically held.

Proper Diameter of Sheaves for Hoisting Rope*

The increase in stress caused by running a rope over too small a sheave is unimportant compared with the resulting increase in rope wear, and considerations of economy can be trusted to prevent the use of sheaves and drums too small for the ropes.

The economical ratio between rope and sheave diameters varies with the character of the wire in the rope and the type of construction. A pliable rope can run more economically and safely over a small sheave than can a stiffer rope. The committee has reports of excellent results from the use of a 1¼-in. rope over an 84-in. sheave, which gives a ratio of 66, whereas in many cases, especially in deep shafts with long ropes which usually are of necessity stiffer, a ratio of 100 has been recognized as not too high.

In connection with the question of sheave diameters, one point should be noted—namely, that it is possible to make the ratio too high under certain conditions, or more correctly stated, it is possible to make the sheave too heavy. This is the case frequently with turn-sheaves, guide pulleys, rollers, etc., on which the arc of contact and the compression between sheave and rope may be so little as to allow slip, the rope failing to rotate the sheave.

Of course such a condition would cause wear and tend to deteriorate the rope faster than would the use of a smaller, lighter sheave. To decide on a suitable size of sheave under such conditions the following rule is serviceable: Suppose that a ratio between sheave and rope diameters of 72 is considered permissible. Then a 1-in. rope would require a 6-ft. sheave. When the deflection is 90 deg., this same result would be obtained by a rule reading: Multiply the degree of deflection by eight-tenths and by the diameter of the rope.

Apply this modified rule where the deflection angle of the rope is less than 90 deg.—that is, when the rope has less than 90 deg. of contact arc on the sheave—and as the deflection angle or arc of contact becomes less, the size of the sheave will decrease. Under this rule, for a 45-deg. deflection angle a 3-ft. sheave will be required when a 1-in. rope is used, and for a zero degree or straightaway pull no sheave is needed.

*Abstract from "Rules and Regulations for Metal Mines," by Ingalls, Douglas, Finlay, Channing and Hammond; Bulletin 75, United States Geological Survey.

Coal Output of South Africa

The Union of South Africa publishes its coal production in short tons and follows the unusual practice of announcing how many pounds there are to a ton. There are many states in our Union that would do well to take that precaution. It is usually impossible to glean from the context what is the size of the ton used, and in some states coal is sold by the long ton and recorded by the short ton. Yet no record is made in the state report to inform the reader which ton is used.

The record of the Union of South Africa for 1914 follows, based on $4.86 per pound sterling:

Province	Tons Sold	Value at Mine	Value per Ton
Transvaal	5,157,268	$5,592,626	$1.08
Cape	53,621	151,472	2.82
Orange Free State	699,217	928,571	1.33
Natal	2,567,817	4,305,566	1.68
Union of South Africa	8,477,923	$10,978,235	$1.29

The high price of the Cape and Natal coals is largely owing to the amount of cleaning necessary. The Cape coal operators in August of this year rejected as waste 20.83 per cent. of the material mined, and the Natal operators so consigned 26.63 per cent., whereas the rejected material in the Transvaal was 12.97 per cent.

The Bugbear

By Rufus T. Strohm

Written expressly for
Coal Age

⁂

HE calls himself a mining man
And always speaks the title loudly,
While in his dealings with his clan
He acts impressively and proudly.
So downright practical is he,
So shy of mental acrobatics,
That he regards most hostilely
The faintest sign of mathematics.

IN reading, if his searching eyes
Fall foul of vinculum or bracket,
You see his ardent temper rise
And hear him make a fearful racket.
With something of the burning hate
Displayed by madmen or fanatics,
So is he wont to contemplate
The varied forms of mathematics.

A HARMLESS radical is quite
Sufficient cause to make him hectic,
And as for formulas, the sight
Of one will drive him apoplectic.
He swears he cannot see the need
Of learning rubbish like quadratics,
And cannot be induced to read
A book involving mathematics.

THERE are a thousand things or so
On which he needs some information;
Like air compression, water flow,
Specific heat, and ventilation.
He ought to furbish up his brain
On heat, kinetics, hydrostatics,
Yet foolishly, with might and main,
He scorns the aid of mathematics.

HE does his best, by rule of thumb,
To meet the problems that beset him,
Nor dreams the fatal day will come
When dullness and neglect will get him.
With others, he would rather snooze,
While cobwebs wreathe their mental attics,
Than buckle down and learn to use
The principles of mathematics.

Fuel-Combustion Improvers

SYNOPSIS—From time to time various chemical substances or the product of mechanical processes is placed upon the market with claims that these improve combustion, increase boiler efficiency, abate the smoke nuisance, decrease the cost of power, etc. A scientific test seldom fails to reveal the fallacy of such assertions, although certain mechanical processes possess a definite economic value if not overburdened with extravagant claims. The most efficient saver of fuel is a careful fireman.

In discussing the subject of combustion improvers broadly, two general divisions present themselves naturally—(a) mechanical devices and (b) chemical compounds, or a combination of some physical or chemical process, illustrated by briquetting a fuel with a chemical binder.

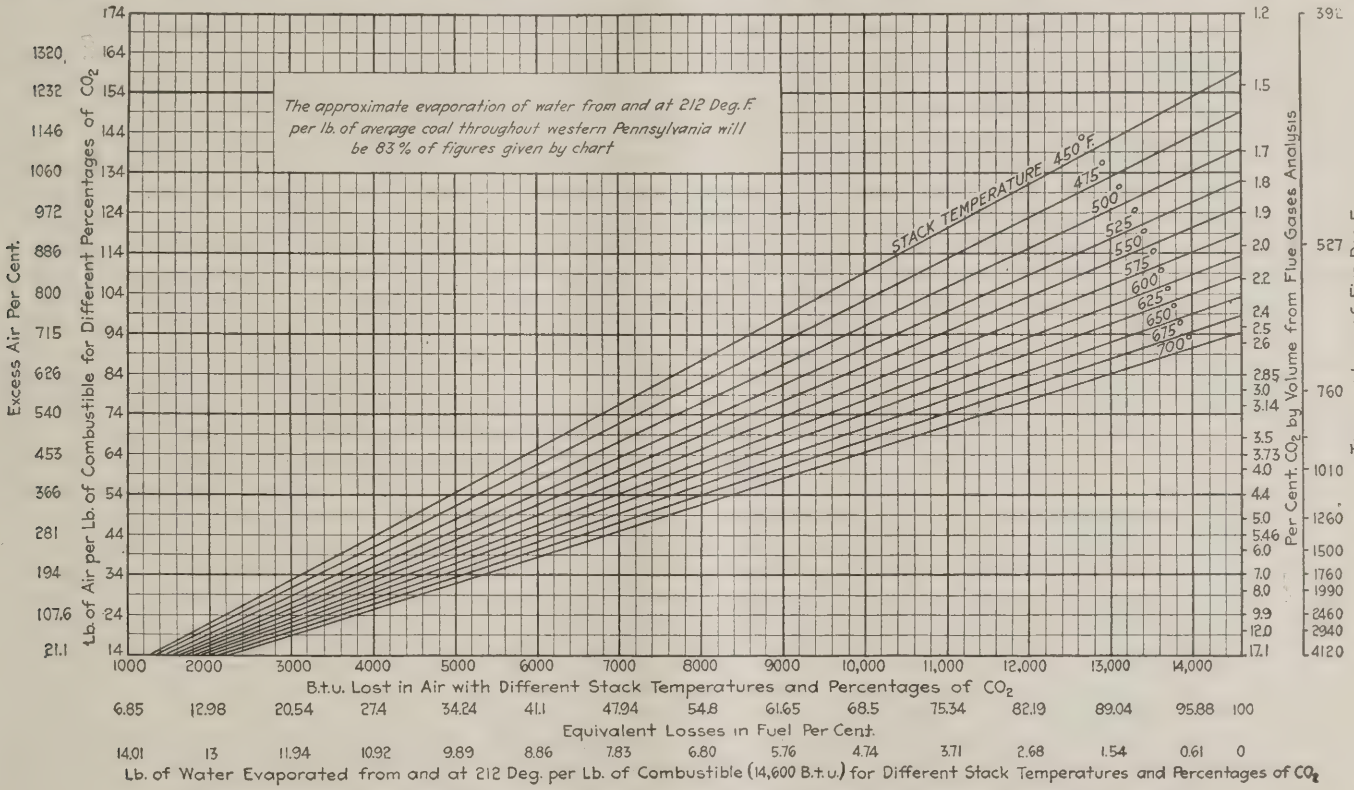

CHART SHOWING APPROXIMATE EVAPORATION OF WATER PER POUND OF COAL

As applied to the generation of steam for a boiler plant, an improver of combustion or an economizer of fuel could be defined as "A means of evaporating more water per pound of fuel than could be secured otherwise, as obtained under standard conditions of weighing the water evaporated, the fuel used, ashes produced," etc.

In these days of constant urging on the part of Government officials to conserve the natural resources of the country, economy in steam generation has come to the front. With it have come a vast number of mechanical devices and chemical preparations. The sponsors for them are for the most part sincere in their belief that they have a wonderful device or preparation by which a ton of coal can be made to evaporate twice as much water as it did formerly. Once in a while we come across a rank imposter or charlatan, one who knows his scheme is no good, but who is smooth enough to "put it over by hook or crook."

In a close analysis of the situation it is found that the majority of the exponents of the various devices and compounds on the market are not technical men. It's a case of "a little knowledge is a dangerous thing." One man who had spent a number of years in promoting a special process of fuel treatment to enhance its heating value did not know what a British thermal unit meant and recklessly asserted that anthracite coal had a higher percentage of volatile matter than bituminous, and for that reason his process was no good for the latter, for it was the volatiles he conserved. Another man confidently told a mechanical engineer that he could obtain 150 per cent. efficiency from his device for injecting superheated steam into the firebox of the boiler. And so on *ad infinitum.*

You cannot get something from nothing. In the case of mechanical devices for economy in steam generation, they must be along well-known and approved lines, else they fail of their purpose. In the case of chemical binders and solutions they must have an inherent heat value or act as catalyzers, otherwise they are diluents. Let us proceed to a few concrete examples:

Some years ago a man had a scheme of briquetting coke breeze, or coke ashes as they are popularly designated in the region where they are produced. His purpose was laudable, as there are thousands of tons of this waste from beehive ovens in the coke-making district accumulated in the years gone by which would be immediately available as a cheap fuel if some economical and satisfactory cleaning and briquetting scheme were developed.

This particular scheme was comprehensive. A big company was to buy up all the "ash dumps" and paralyze the regular coal trade by the cheapness and efficiency of its own product. Why did this most beneficent briquetting project fail? Let us examine the so-called composition fuel, analysis of which is given in the following table:

	Briquetted Coke Breeze	Natural Breeze
Volatile matter	14.52%	10.00%
Fixed carbon	33.51%	59.50%
Ash	57.97%	30.50%
Sulphur	0.80%	0.85%
Heat content, B.t.u.	6,594	9,890
Composition of the ash:		
Silica (SiO_2)	11.64%	
Alumina (Al_2O_3)	6.20%	
Lime (CaO)	15.14%	
Magnesia (MgO)	0.30%	
Iron oxide (Fe_2O_3)	15.86%	

The analysis of the ash of the composition fuel shows that plain, everyday cement was used as a binder in the briquetting process, as evidenced by the lime content and the physical appearance of the briquette itself. It did not take the consumer long to "get next" to the fact that for every ton of fuel burned more than a half-ton of ashes was produced. He did not need a chemical analysis to prove to him that such a fuel was dear at any price.

In this case the binder acted as a diluent, since it had no inherent heating value. It will be noted that the heat value of the composition fuel is only about two-thirds of that of the coke breeze in its natural state.

More subtle and convincing is the second instance, which had to deal with a chemical to be dissolved in water and sprayed on the coal or other fuel. Besides increasing the efficiency of fuel 25 per cent. or more, the additional claims were made that the use of the solution removed the sulphur, prevented clinkers and solved the smoke problem.

A physical examination of the solution used showed it had a specific gravity of about 1.05, which indicated approximately a 5 per cent. solution. In practice, 10 gal. of the solution to the ton was sprayed on the fuel as it was fired under the boilers. At this rate, not over ¼ per cent. of the chemical at the most would actually get on the coal.

Thus it will readily be seen that it must be a pretty active chemical to produce such amazing results in efficiency—¼ per cent. to give 25 per cent. more heating value to the fuel. *Mirabile dictu.* The chemical examination of the compound to be dissolved in water is as follows:

Silica (SiO_2)	4.14%	Magnesia (MgO)	1.37%
Alumina (Al_2O_3)	11.33%	Sodium (Na)	3.83%
Calcium (Ca)	11.10%	Chlorine (Cl)	22.80%
Lime (CaO)	1.68%	Water and loss	42.94%

Dropping the terminology, in plain English the basis of the compound used was calcium chloride, a byproduct of the soda-ash industry. Ordinarily this chemical sells for about ¾c. per lb., yet as a combustion improver it sold for 10c. per lb. A rose by any other name would not smell as sweet, it seems. There is a prevailing belief that saline substances like common salt, thrown on a fire, make it burn brighter and give off more heat. At least that must have been the notion of the promoter of calcium chloride.

As stated previously, practical firing tests indicated an apparent saving of fuel when treated with the calcium chloride solution. It would convince the ordinary boiler house fireman, but the fallacy was shown on making evaporation tests.

For instance, a firing test lasting 5 hr. showed an apparent saving of about 20 per cent. by the use of treated coal, yet an evaporative test showed that practically the same amount of water per pound of coal was evaporated by the use of untreated coal as with the treated fuel. Furthermore, it was found that by spraying the dry raw coal with water—10 gal. to the ton—there was the same apparent saving in fuel as was obtained by the use of the chemical solution, yet no greater evaporation of water.

THE USE OF SALINE SOLUTIONS

The logical conclusion was that the "joker" was in wetting the coal, the calcium chloride exerting no influence whatever on the heating value of the fuel. Anyhow, if some boiler-room men think they obtain a greater efficiency by the use of saline solutions sprayed on coal, it would be great economy to buy the chlorides themselves instead of purchasing them in the form of expensive compounds.

As for the prevention of clinkers, it is almost absurd to think that such small amounts as ¼ per cent. of any chemical would exert any beneficent influence. The idea put forth was to combine the sulphur with the ashes by the use of the lime salt, but it did not work out, as evidenced by the following analysis:

	Raw Coal	Boiler Ashes
Volatile matter	28.090%	3.700%
Fixed carbon	62.260%	23.020%
Ash	9.650%	73.280%
Sulphur	1.235%	0.378%
Heat content, B.t.u.	13,209	....

It will be noted that there is still some combustible in the ashes, else the sulphur would probably have all been burned out.

The flue gas from the coal treated with calcium chloride is normal, and as far as could be determined, the "smoke nuisance" was not abated. This is the analysis of the flue gas:

	By Volume
Carbon dioxide (CO_2)	7.4%
Oxygen (O_2)	11.2%
Carbon monoxide (CO)	nil
Methane (CH_4)	0.2%
Nitrogen (N_2)	81.2%

A third gentleman spent 8 or 10 yr. in perfecting a briquetting scheme for anthracite culm, which corresponds to the waste from coke ovens. This was another laudable undertaking, but unfortunately the briquetted fuel did not meet the claims of the enthusiastic inventor.

This briquetting scheme was along well-known and approved lines, the binder probably being a coal-tar derivative. The mistake of the promoter was in the claim made for enhancing the heat value—as much as 100 per cent. It would not take an intelligent consumer long to find out he was being "stung." The analyses of some of the briquettes are as follows:

	Sample No. 1, Anthracite Culm Briquettes	Sample No. 2, Stove or Chestnut Anthracite
Volatile matter	12.760%	12.220%
Fixed carbon	58.740%	77.280%
Ash	28.500%	10.500%
Sulphur	1.007%	0.769%
Heat content, B.t.u.	9,030	12,347
Composition of the ash:		
Phosphorus (P)	0.020%	0.036%
Silica (SiO_2)	16.130%	4.670%
Alumina (Al_2O_3)	8.310%	3.320%
Lime (CaO)	0.300%	0.440%
Magnesia (MgO)	0.100%	0.100%
Iron oxide (Fe_2O_3)	1.500%	0.930%

It is readily seen from the analysis that there is no enhancement of the heating value, though the binder does not act as a diluent as in the first briquetting scheme. The briquette was bona fide in that respect, and such a process has a positive commercial value when not improperly exploited. The chemical analysis shows that about 5 per cent. of the so-called binder was used, which in addition to the great pressure exerted in the process made a very acceptable briquette or eggette.

Finally, the best combustion improver or fuel economizer is the man who shovels coal into the boiler furnace if hand-firing is the practice. If correct methods of firing were introduced in the boiler room and followed up, there would be little need for artificial accelerators. The temperature of the stack gases, their composition, the depth of the fire, etc., have more to do with the amount of water evaporated per pound of coal than anything else.

Any campaign for economy should be along these lines. It would appear well worth while to install portable gas-analyzing outfits in the boiler room to check up the combustion. This method used in conjunction with the stack temperatures would serve to show the losses in fuel or the efficiency attained.

P. W. Matthews, a mechanical engineer of Scottdale, Penn., has worked up an interesting chart that could be used to advantage in the interpretation of the results of the flue-gas analysis and the stack temperatures. This is shown herewith.

To illustrate: Assuming that the flue gas shows 5 per cent. CO_2 and the stack temperature is 600° F., by referring to the chart it will be found that there is a loss in fuel of about 41 per cent. and that only 7.4 lb. of water is evaporated per pound of coal, with the correction noted. Again, if the stack gas shows 10 per cent. CO_2 and 500° F., the loss in fuel is between 16 and 17 per cent., and the water evaporated (12×0.83) is about 10 lb. per pound of coal.

In the flue gas cited elsewhere, with 7.4 per cent. CO_2, the fuel loss is about 23 per cent. and the water evaporated about 9½ lb. By actual weight the water evaporated was 9.2 lb. per pound of coal.

Mr. Matthews' chart is novel and should demand attention from those interested in fuel economy.

Extracts from a Superintendent's Diary

Today I rode through a deserted coal-mining camp. Only a few years ago it was known far and wide as the model camp of the state, but now its glory has faded and rack and ruin greet the eye at every turn. Any abandoned mining camp presents a cheerless prospect to a visitor, but to see this once-prosperous village so quickly reduced to the last stages of decay was especially depressing to me because I am familiar with so much of its inside history.

The founder of the camp was a true reformer with advanced ideas about the responsibilities attached to wealth, and in planning his village he left no stone unturned in his effort to meet all of the responsibilities as he saw them. One-half of the residence portion of the camp was reserved for men who might desire to purchase their own homes, and every encouragement was given to workers to make such purchases possible. The lots were sold at a price that left only a fair profit on the original investment, and houses were built to suit the purchasers on payments spread over long periods.

Many of the lots were sold and attractive homes sprang up everywhere. Still today the man who planned it all rests in a suicide's grave, and all over the land men and women recall him as the man who induced them to make unfortunate investments from which they will probably never fully recover. A few have lived long enough to become convinced that the failure of the mine could not have been foreseen, but just after the crash, almost to a man, they believed that the failure was premeditated. Even after the founder took his life, feeling against him ran high, and rumor had it that the deed was the result of a troubled conscience.

If unlooked-for faults had been encountered or the company had been wrecked by a terrible calamity, such as a fire or an explosion, people might have understood; but how can simple folk be expected to understand that the opening of a new coal field, entitled to lower freight rates on account of its location, may force competing companies into bankruptcy?

Nor was the lot of the founder a happy one even before the final crash. At one time the workers called a strike, and almost as soon as the men walked out reporters arrived on the scene to fill the newspapers with stories about the heartless mine owner who contemplated closing down his mine that he might starve his employees into submission and that in face of the fact that these selfsame employees had invested their savings in his enterprise. And during normal times occasionally the wanderlust would seize one of the workers who had invested in a home, and if forthwith he could not find a purchaser (as if such a thing were possible anywhere) he would begin to make remarks about the man who had made him a slave for life. In contrast to the man who desired to leave and could not, would often be found a man who should have been forced to leave because of violation of rules and regulations, yet was allowed to remain because the founder could not long enough get his concience under control to order the man out of a home which he himself had sold him.

It seems a hard thing to say, but I returned home today firm in the conviction that the majority of mining men are ever destined to be homeless wanderers on the face of the earth, not because mine owners are indifferent to their responsibilities, but because fate so wills.

CHRISTMAS PRESENTS

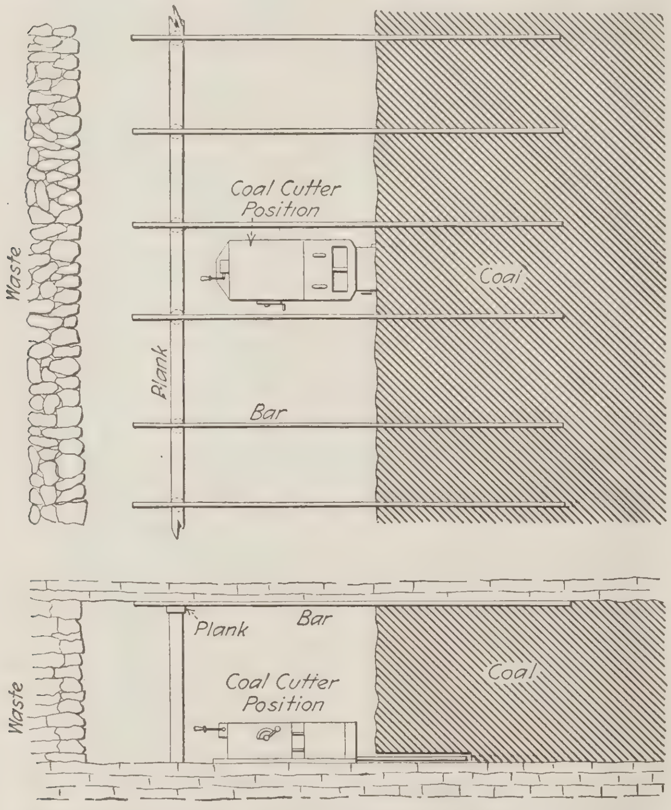
Details of Cutter Operations

By J. F. K. Brown*

Sometimes in the course of operating coal-cutters, local areas of bad roof develop. As a rule such occurrences are most frequently met with in those seams which have either a shale covering or a thin sandstone roof with shale above. In nearly all cases it is the management's desire to keep up the roof if possible in order to avoid unnecessary deadwork, since when under these circumstances a roof develops frequent falls because of a local weakness in the strata, there is a much increased cost of operation placed upon that section.

Furthermore, a roof of this nature, when once broken, frequently is difficult to catch again, and so the trouble gradually spreads until it may perhaps cover a wide area.

In one case where trouble from such a cause was constantly occurring, the following steps were taken to counteract it. The seam was 4 ft. 6 in. thick, and the roof was a shale in which false bedding was strongly developed. Under normal conditions, operating a coal-cutter at night undercutting the seam 3 ft., this roof proved satisfactory, but there occasionally developed areas in which the shale would start falling heavily, or "running," as far as could be judged, through an extra well-developed line of bedding.



SKETCH SHOWING HOW THE BARS WERE HANDLED

Once this fall took place, it became a regular nightly occurrence to find the machine buried at this point, and as the face advanced farther, this broken area gradually widened out. It seemed possible that only after a great expenditure of money on extra timbering during many months' work would the regular roof be again held. To overcome the difficulty, as soon as a soft spot manifested itself a policy of supporting the roof in advance of the coal-cutter was adopted.

Twelve 1-in. iron rods, 9 ft. long, were obtained and, with a 3x2-in. plank at least 12 to 15 ft. long, were brought into the workings, as was also a drill with an extra long twist steel and a 1½-in. bit of such a type that drilling could take place in a practically horizontal plane at the roof of the seam.

With the drill, holes were driven horizontally at the roof about 3 ft. apart to a depth of roughly 6 to 8 ft., the rods being inserted and the projecting ends upheld by the plank, which in turn was "propped" by the usual mine timber. This provided a support for the roof before the coal-cutter came along during the night shift.

On the coal-cutter reaching the props supporting the plank, they were withdrawn one by one as the machine advanced and reset behind it. When the coal was loaded out, the rods had still about 3 ft. of advance grip on the coal roof. The alternate rods were then withdrawn and drilled in again a further 3 ft. or more, until the entire set had been advanced to the original position ready for the night's cut. This process was repeated until the roof appeared to have regained its normal strength, when the rods and plank were laid aside for future use.

By this means the skin of the roof on the top of the coal is preserved intact, and a great deal of awkward work in getting rid of much fallen material is obviated. There is of course the extra labor involved in setting up the bars, but it costs less than removing the broken rock night after night, not to mention the loss of time in cutting. Furthermore, if this work can be accomplished during the daytime and so does not interfere with the cutting time of the machine.

⁂

Coal on Island of Bornholm

It has just been reported, says *Commerce Reports,* that coal in some quantities has been discovered on the island of Bornholm, which is not far from the coast of southern Sweden, but which is a possession of Denmark. It is probable that the presence of coal on this island has been known for some time, but its commercial exploitation has been retarded by the competition of other European fields.

Because of the war this competition has for the time being lost its force, and two Danish geologists and a Swedish mineral surveyor have proceeded to Bornholm to look into the possibilities of the new field, with special reference to marketing the fuel should it prove suitable for railway and industrial use. The deposits are said to be a short distance from Ronne, the chief town of the island.

⁂

Preparing Typewritten Matter for Blueprinting

It is often desirable to blueprint a typewritten sheet. By making use of a simple but little-known kink, this can be satisfactorily accomplished. It is almost impossible to get a satisfactory blueprint from an ordinary typewritten sheet; but if, when the sheet is being written, a piece of carbon paper is put behind it so that the carbon transfers to the back of the paper, the typewritten sheet will give a perfect blueprint. This is because the impression of the typewriter ribbon is reinforced by the carbon on the back, neither one being heavy enough alone to give a satisfactory print.—*Engineering and Mining Journal.*

Observations and Experiences in Mine-Inspection Work

By J. J. Rutledge*

SYNOPSIS—Permissible explosives required in mining coal on Indian lands in Oklahoma. Accidents due to shooting long holes, rapid firing, careless tamping and overcharging of holes and numerous other causes arising from neglect or ignorance of the miner. The practice of firing "cracker shots" condemned. Accidents occur more frequently on Saturdays than at other times.

The Southwestern District of which I, as district engineer for the U. S. Bureau of Mines, have charge consists of the states of Texas, Arkansas, Oklahoma, Kansas, and southern Missouri. So far as accidents are concerned, we have little trouble in Arkansas, and scarcely any in Missouri, but one or two accidents having occurred there during the past year. Most of the calls for rescue work, or for investigations of mine accidents, come from the Oklahoma and Kansas coal fields. I will briefly mention a few observations that I have made in these coal fields.

By far the greater portion of the coal produced in the two states last named is shot off the solid with black blasting powder. It may not be known to all that the Secretary of the Interior issued an order, which took effect recently, requiring the use of permissible explosives in all mines on Indian Lands in Oklahoma, but providing the alternative of using black powder for shots fired by electricity from the surface, after everyone had left the mine. It was in compliance with this order that recently an examination in detail was made of all mines on Indian Lands in Oklahoma. These mines are on the segregated Indian coal lands, and the leases are made with the coal-land trustees of the Choctaw and Chickasaw Nations. Each lease stipulates that the Secretary of the Interior may, at any time, issue regulations governing the operation of the mines. Of course these regulations always recognize the police powers of the state. In making the examination, the following dangerous practices were noted:

Shooting Long Holes and Rapid Firing

One of the most frequent of these practices that have resulted in trouble is the shooting on the solid of extremely long drillholes. One foreman was heard to remark, "That long hole pulled that time; next time I'll try a little longer one and give it a little more powder. Then, I'll just have to set my post up the one time, while if I drill shorter holes I must make more set-ups, which makes extra work."

A second great cause of accidents has been the extremely rapid firing of the shots. Most of the recent disasters were caused by undue haste in shooting holes. In some instances 45 to 50 shots have been fired in as many minutes. On a pitch of anywhere from 15 to 35 deg. and, in some cases, even 60 deg., it is difficult to imagine how a shotfirer can get around fast enough to fire so many shots in so short a time, much less to tamp and fire them.

Another source of trouble has been the careless tamping of shots. There is little or no restraint on the manner of tamping. The Oklahoma law requires that all shots shall be tamped by the shotfirer, after every other person has left the mine. Quoting literally from a good authority: "The shotfirer, in many instances, has confidence in certain miners and, in some cases, allows the miner to tamp the shots for him, in order to lessen his own labor. Another trouble is that the 'dummy' filled with tamping, or stemming, which is provided by the miner is often not used by the shotfirer, but thrown into the gob instead. If a dummy is broken the shotfirer will not use it and does not stop to make a new one."

Another trouble is that resulting from two shotfirers firing shots on the same run. If an explosion occurs, or a windy shot, or a gas ignition, generally both the shotfirers are caught and either severely injured or killed by the accident. The shotfirers should each have separate runs, so that should an accident occur on one run it will probably not harm the man on the other run. The use of slack dummies, or dummies filled with coal drillings, has also resulted in accidents, the dust and fine coal in the dummies propagating the explosion or flame from the black powder.

Shooting with or Ahead of the Air

Still another trouble is firing shots advancing *with* the air current instead of against it. This practice should be prohibited. In some instances, several shots have been fired at one time, and disasters frequently result, especially in narrow places. Still another trouble has been caused by premature explosions resulting from the use of short fuses. Recently, several shotfirers have been burned and injured by premature blasts, resulting from the ignition of gas and the consequent lighting of the fuse and the firing of dependent shots, in advance of the opening shots.

Another cause of accident has been the firing of a "split shot," or a shot that is made by drilling a hole into a mass of coal that has been cracked and shattered by a previous shot. Frequently a hole is drilled under these circumstances and charged with black blasting powder. A number of accidents have resulted from this cause. People who are well informed on the subject state that the average life of a shotfirer in Oklahoma is two years. I think it was Mr. Wilson who advocated, a few moments ago, the certification of shotfirers. It would seem from what I have just said that the less intelligence the shotfirer possessed the better fitted he would be to fire shots under some of these conditions.

Another trouble is shooting ahead of the air. Often there is a room-neck or a crosscut containing standing gas, and a windy shot occurs in the entry inby of these places and ignites the gas and the shotfirer is burned, usually fatally, before he can get out of the place. An additional cause of accident I have noticed in the Southwest is the use of short-cuts by the shotfirer, when making his rounds.

---

*Proceedings of the eighth annual meeting of the Mine Inspectors' Institute of the United States of America, held at St. Louis, June 8-11, 1915.

Sometimes a room has been driven through from one entry to the entry above or below, and the shotfirer goes through these rooms in order to shorten the distance he has to travel. This haste does not give the gases generated by the firing of the shots time to dissipate; nor does it allow the fine coal dust stirred up by the force of the explosion sufficient time to settle and, in this way, contributory causes to an explosion are created.

Shotfirers should not use these short-cuts, but should follow the courses taken by other mine employees when going through the mine workings. There will be time enough, then, to allow for the cooling of the gases liberated by the explosion and the settling of the fine coal dust. The Oklahoma mining law provides for a good system of telephones, and I am glad to say that this law has been universally enforced. It has been suggested and one or two of the inspectors have instructed their shotfirers to use these telephones in the entry to notify the engineer on the surface of the progress of their work. There is always someone on duty on the surface when the shotfirer is at work, whom he can inform when he starts firing on an entry and again when he has completed the work in that entry. Then if anything happens to the shotfirer those on the surface who go to his aid know where to look for him. At times, the entire mine workings have been searched before the disabled shotfirer has been found in the least expected place. The telephones are in the mine, in compliance with the law, and they should be used for the purposes intended. About a year ago an injured shotfirer reached a phone in his entry, called for help and, receiving prompt assistance from the surface, was soon in the hands of the doctor.

Failure to Test for Gas Before Firing

Frequently, shotfirers fail to carry safety lamps to test for gas and, as a result, are burned by walking into a body of gas with a lighted open lamp on their head. Recently, a shotfirer working on a pitch of about 55 deg. went into a room, the face of which was a slight distance ahead of the air. Neglecting to make a test, he ignited the gas with his naked light and, in trying to get out of the way of the burning gas, fell down the pitch. This man was more hurt by the fall than by the slight burns he received.

In the Kansas coal field, during the past winter, we had one shotfirer who, in two months' time, had three buddies killed while they were firing shots in the mine with him. In each instance this man has escaped uninjured while his pardner has been killed. An interesting incident that occurred in Kansas I will mention here was the escape of a shotfirer wearing a self-rescue breathing apparatus which he had fitted on his face and was using while at work firing the shots. He reported that the self-rescue apparatus undoubtedly saved his life. The "buster," or "opening," or "A" shot, when coal is shot off the solid, has resulted in small explosions, and this danger was recognized in the orders of the mine inspector and is now prohibited by the mining law.

Speaking of mining law, I desire to mention a remarkable condition that I found in Oklahoma. One of the first things I did after reaching that field was to codify the mining laws of Oklahoma. There were some four or five regulations, which were enforced by the mine inspector and which I assumed were in the mining law but could not be found when this codification was completed. One of these regulations is the requirement of safety chains on man-trips. Another is the requirement that the mules be taken out of the mine at night. These were good measures. I found that five or six such orders had been issued by the inspector. They had all the effects of law, but were not on the statute books and yet they were obeyed implicitly.

Another trouble is the "double-cracker" shot, by which is meant a hole drilled in a straight face of coal to a distance of from 3 to 6, and in some cases 10 ft. and charged in most cases with dynamite. Sometimes, these holes are 12 or 14 ft. deep. I have myself measured a breast-auger that was 14 ft. 8 in. in length. It was so long that it could not be taken around a switch without bending the auger. These holes are drilled horizontally, and, usually, in pairs, in the same vertical plane and from 1½ to 2 or 3 ft. apart. Of course, it would be dangerous to fire such holes with black powder, but the miner thinks that he is safe in using dynamite, which he thinks explodes without flame, and is not apt to ignite gas or dust. Formerly, all the shots were charged and fired with dynamite; but, recently, permissible explosives have been used instead of the dynamite, which is one of the good results accomplished by the demonstration of permissible explosives in these mines.

"Cracker Shots" Condemned

The practice of firing "cracker shots" has been long established and it would be difficult if not impossible to change it. The purpose is to crack the coal so that the miner is enabled to make a shearing with his pick more easily, at that point. Of course, it is necessary to exceed the charge limit fixed by the Bureau of Mines of 1½ lb., when firing shots of this sort; but if one cannot get a whole loaf it is better to take a half-loaf, and it is far preferable to use "permissibles" in this manner, than to fire these shots with dynamite. Permissible explosives are now almost universally used in these cracker shots.

Sometimes they use from four to six sticks of permissible powder, each 1¼ or 1¾ in. in diameter by 7 or 8 in. in length. Two or three years ago I was talking with a miner in one of the mines where there had been a very serious disaster, and asked him what amount of charge had been used in some of the very long holes. He informed me that he had used 13 sticks of permissible explosive, but added, "That was the limit." On my inquiring why he had not filled the hole to the mouth with the explosive he repeated his statement that 13 sticks was the limit. He showed, on further inquiry, that he was fully informed as to the danger of such shooting, for he stated that he would not think of firing such shots with black powder.

Use of Permissible Powder

The point I would emphasize is that when you have to deal with conditions such as I have mentioned, it is better to realize that fact and cut the cloth to suit these conditions. We have had excellent coöperation on the part of the mine operators, regarding the use of permissible powder in these cracker shots. Of course, if you adhere to the limit charge in a shot of that sort you would get no result in the amount of coal produced. We still have a little trouble with dynamite being used in these cracker shots; but, generally speaking, so far as my observations go, this dangerous explosive has been almost eliminated from Oklahoma mines.

I will refer to another curious situation that has developed. One or two mines, using permissible in the proper manner, adhering to the limit charge, and blasting the coal down in workmanlike manner after it has been undercut by a mining machine, have continued to fire the "brushing shots" in the roof, with black powder. The brushing shot is generally fired after the coal has been blasted. The permissible explosive is quicker in action than black powder and, in the immediate vicinity of the drillhole, does shatter the coal much more than black powder would. That is to say, the coal is crushed finer in the circumference of the drillhole when permissible is used, than is the case with black powder, especially, if the hole has been overcharged. To fire the black powder into a cloud of fine coal dust suspended in the air is a dangerous practice. But, in this mine, black powder was used only in the brushing of the roof, and generally only one brushing hole was fired, to each machine cut made. The old saying is that "A chain is no stronger than its weakest link." This practice was the weak link which might cause disaster in that mine, although all other operations were safe. However, the use of the black powder in this mine has recently been discontinued.

Frequency of Accidents Occurring on Saturdays

Another rather remarkable thing is the number of accidents that have occurred on Saturdays. The shotfirer is in the mine after everybody has left. He does his work anywhere from 4 to 12 p.m., and so many accidents happen on Saturdays that our men, in the danger season, never leave the rescue stations, on these days, until one or two o'clock a.m. Some of the Kansas rescue men have, as a result, reached a mine within forty minutes after an explosion. The only way that I can account for the frequency of explosions on Saturdays is that the shotfirer is in haste to complete his work on that evening.

I remember now that last July we had one on the second, and had just about completed our inquiry into that one when we had another on the sixteenth. It was the same way this season, and I believe it must be that the shotfirer is in a hurry to get out and is careless or hasty in his work. A man certainly is careless when he shoots ninety shots in forty-five or fifty minutes, as was done in a recent case of a shotfirer's explosion. Those who have fired shots know that they cannot be tamped and fired in that time.

But, I am glad to report some advances in the Kansas field; they have at the present time, certainly two, possibly three, electric-shotfiring systems. Two of these have been in use for some time. The other one, I think, has only recently been introduced. We still have in Oklahoma the electric shotfiring system, which has been in use in one mine—Alderson, 38—for four or five years. In talking with the miners in Kansas, especially the foreign-born miners, I have been interested to learn that they were nearly all in favor of the electric-shotfiring system. I could not understand the reason for this until I went below and looked over the conditions, and it seemed to be a fact that the output had increased about 100 tons per day, after the introduction of those systems. Investigation showed that a man could fire more shots than he could under the other system, as formerly the shotfirer would only fire two or three in each working place. But I think the men in Kansas lately made an agreement limiting the number of shots to three in each working place when firing electrically; we have always had that rule in Oklahoma.

It is impossible to use chain mining machines on the steep-pitching seams, so that most mines are using a post-puncher machine instead, and with the use of permissible explosives, the practice is spreading. Rooms, as well as entries, air courses, and all narrow places are cut by means of a post-puncher, either overcutting or undercutting the coal, but little shearing is done. One or two remarkable and economic results have obtained from the use of the post-puncher. In overcutting, the drawslate has been cut out by the use of this machine, and the cutting has been thrown into the gob. It has been found, after this overcutting, that the fine coal made has been clean enough for marketing without washing, and all are interested in this method of mining that avoids the necessity of washing the coal.

In some of our mines having the best discipline the superintendent requires that a shotfirer shall spend at least four hours in the mine, and this rule has reduced the number of accidents, as it requires him to take more time for his work. I have operated mines, in times past, in the Springfield district, in Illinois, and I think that is the most suitable coal I have ever found for shooting off the solid. To my knowledge, there are some of the grandsons of the old original miners that are now mining there. But shotfirer's accidents are rare in that district. However, I am not so strong for solid shooting as formerly. I have given these few rambling remarks drawn from my own experience in the last two years and a half, in mines on the Indian lands in Oklahoma.

⁂

Cutting Out the Mica

It has been found from experience that in many cases the sparking of motor commutators can be prevented by cutting out a part of the mica insulation between the bars. A V-shaped slot is cut, the bottom of which is about $\frac{3}{32}$ in. below the surface of the copper, while a thin strip of mica is left at each side. The leaving of this strip of mica at the side of the slot prevents the formation of an electrical connection between adjacent bars by any accumulation of carbon or other material in the slot.

There seems to be a tendency in some cases for the mica to wear down more slowly than the copper, and if this occurs there will be sparking. This should be stopped by cutting out the mica as suggested.

⁂

An Application

Among a number of applications received recently by a large coal-mining company was the following orthographic gem:

Sir: I have bin informed by the Engr. Agency that you are in need of a Transetman. I would like to accept a passisian of that kind if you think me caperable of holding the passion.

I have had Six Years experence in R.R. Const. and Loc. and am a fairly good drausman and have bin in mines with Mineing Engr. good many times. Can furnish you with rep. if need to. Yours Verry Truly,

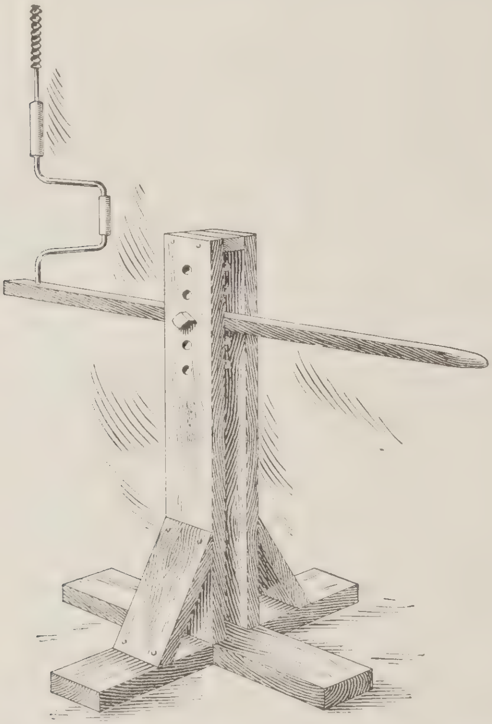
P. S. Can report in verry Short notice 5 days.

A Home-Made Boring Jack

By Sim C. Reynolds*

It is frequently found necessary in mine work to drill vertical holes in the roof. For the spads in engineering work a brace and bit will usually suffice where the hole to be drilled does not exceed ½ in. in diameter and 3 or 4 in. in depth.

But where wider and deeper holes are required for the insertion of trolley hangers, signal or telephone wires or any wiring that has to be hung from the roof, the drilling of such holes is sometimes a difficult task by the ordinary method. This is particularly so when the roof strata are flinty or extra tough, and the strength of two men is often required to do the work. Under many conditions it is even then an exceedingly slow process. These considerations in part prompted the designing of the device shown in the accompanying illustration. This simple arrangement has been found quite efficient for the work intended.



A SIMPLE AND EFFICIENT BORING DEVICE

As the illustration shows, the device is built on the lines of the ordinary lever-jack, and while it requires two men to do the work, one at the drill and the other at the lever, this is largely compensated by the extra speed with which holes may be forced in. Furthermore, if properly constructed the device may be easily moved from place to place, one man being able to carry the outfit. This is a decided advantage when drilling is to be done in a roadway where hauling is going on.

Holes closely bored in the uprights and lever and protected by metal bushings to prevent undue wear, with an efficient and easily removed cotter-pin, obviate any possible difficulty in driving the hole reasonably straight. The occasional easy adjustment of the lever in or out, up or down, as the needs may require, neutralizes the natural tendency of the pressure point to describe an arc and thereby prevents the bit from "binding" in the hole.

Naval Coal Requirements

That probably 200,000 tons of coal a month would be required by the navy between Panama and Manila in time of war and that this would have to be either Pocahontas or Welsh was set forth by Capt. A. P. Niblack, U. S. N., before the Society of Naval Architects and Marine Engineers. Captain Niblack's paper was a plea for preparedness.

Assuming that a fleet consisting of 30 battleships, 20 of our largest cruisers, 40 destroyers, 20 colliers, 3 supply ships and the fleet repair ship "Vestal" made a leisurely voyage from Panama to Manila by way of Honolulu, Midway and Guam, a distance of 10,000 miles, Captain Niblack calculated that the fleet would consume 18 tons of coal and 3½ tons of oil per mile going at a speed of only 10 knots, or a total of 202,000 tons of coal and 36,800 tons of oil. In addition it is estimated that the fleet would be in port a total of 30 days and that it would consume 1,000 tons of coal and 160 tons of oil daily, making a total of 30,000 tons of coal. In his paper Captain Niblack presented the following tabulation:

	Sea Miles	Coal	Oil
Panama to Magdalena	2,265	49,000	8,500
In port 5 days	....	5,000	800
Magdalena to Honolulu	2,543	55,000	9,500
In port 5 days	....	5,000	800
Honolulu to Guam via Midway	3,450	74,700	13,000
In port 10 days	....	10,000	1,600
Guam to Manila	1,542	33,500	5,800
In port 10 days	....	10,000	1,600
Total	10,000	242,200	41,600

To show the amount of fuel left over at the end of the voyage Captain Niblack said: "Taking from the Naval Pocket Book the bunker capacities of all the ships enumerated as comprising this fleet, adding to it the carrying capacities of coal and oil of the 20 colliers and comparing the sum with the consumptions of fuel in the foregoing table, we have, in tons:

	Coal	Oil
In bunkers	129,000	16,900
As cargo	120,000	38,100
Total	249,000	45,000
Consumed as per table	242,200	41,600
Margin	6,800	3,400

"The margin remaining as shown is uncomfortably small, and we are at once confronted with the problem of the 240,000 tons of coal and 40,000 tons of oil required to get the ships back to Balboa. The bunker coal for the colliers can be obtained from Singapore or Australia, but only Welsh or Pocahontas coal serves for naval use. The problem, elementary as it may seem, is extremely complicated even in time of peace. What it would be in war is another matter, but it illustrates the profoundly gratifying fact that we have wisely given our ships a large steaming radius and, more wisely still, have gone in for government-owned colliers and supply ships, while every other navy in the world has to rely on chartering. With adequate supplies of coal and oil at Honolulu, Midway and Guam, we may attain the desired mobility of the fleet even in war, provided we adequately fortify Guam and Midway.

"In time of war the high speeds required in scouting and protecting would increase enormously the demand for fuel, and the 10 knots' speed for the fleet shows how narrow is the margin, as it gives the minimum easily increased by leaps and bounds under stress of weather or war operations. It is estimated that probably 200,000 tons of coal would be required along this route in wartime."

Change of Railroad Rates in West Virginia*

By J. W. Dawson†

SYNOPSIS—The freight increase in West Virginia is for the purpose of relieving the railroads from the necessity of reducing freight rates in Ohio. The writer alleges a conspiracy of the Pennsylvania R.R. and the Pittsburgh Coal Co. against the West Virginia operators.

The proposed change in freight rates is the greatest crisis that has ever confronted the State of West Virginia. It will involve each year more than the Virginia debt, and yet that has been regarded as a critical matter for the state. The coal produced in West Virginia is 50 per cent. more valuable than the agricultural products of the state, and the coal industry annually brings into West Virginia about half as much money as is on deposit in all the banks of the state combined.

The panics of 1907 and other years were caused by a fear on the part of the banks in one section that they would be unable to get any more cash if they let out what they had on hand. If that is true, what would happen if they knew 50 per cent. of their deposits, $75,000,000 annually or $250,000 daily, would be cut off next year; yet this is the amount that the coal industry brings to West Virginia, and the shutting off of this inflow of money would create such a panic as has never been seen or dreamed of in this state.

What Idle Mines Would Mean to West Virginia

But the crisis does not confront only the 450 coal companies, but also in as large or larger degree the 80,000 mine laborers, the 250,000 women and children who are dependent on them, laborers in all other walks of life, the farmer and his laborers, and the wholesale and retail merchants. It will even affect the state by reducing the revenue from taxation.

The 450 coal-operating concerns will be injured to the extent of $5,000,000; the miners and their families will lose $55,000,000, or 11 times as much as the operators. About 95 per cent. of the $75,000,000 for which the coal of West Virginia is sold comes from without the borders of the state. If the coal industry of West Virginia should be destroyed and the railroads of the state thereby lose their largest tonnage and revenues, will not the merchant and manufacturer be required to pay higher freight charges on his wares? And will not passenger rates be advanced likewise to make up the deficit to the railroad?

If West Virginia could have freight rates as favorable as Pennsylvania in marketing her coal, the coal lands of the former state would not then be only worth from $100 to $200 per acre while lands in Pennsylvania, containing less valuable coal, are valued at from $1,500 to $2,000 an acre. The valuation for taxes in West Virginia would after the change be about $2,000,000,000 instead of $1,250,000,000.

Now what threatens the very existence of this business? Not the proposed 15c. advance in freight rates. That is only the last straw that may break the camel's back. The real danger that threatens the state is the illegal combination of railroads and coal operators and coal miners of other states, which has done for years and still is doing everything it can to destroy the coal industry of the state and will, through it, destroy other business in West Virginia.

When the 200,000 or more coal miners and thousands of coal operators of Ohio, western Pennsylvania, Indiana and Illinois meet each two years to discuss wage agreements, much time in their deliberations is devoted to ways and means of "destroying West Virginia's coal industry," and no mention is made of destroying that of other states. This is a matter of record in the printed proceedings of their conventions.

Pennsylvania Operators Desire to Close West Virginia Mines for 50 Years

A few years past one of the principal officers of the Pittsburgh Coal Co. testified before the Interstate Commerce Commission in the lake-rate cases, known as I. & S. No. 26, that "the opening of the West Virginia coal mines was an economic blunder and should have been postponed fifty years." In this he voiced the sentiments of the officials of the Pennsylvania R.R. and most coal operators of western Pennsylvania, Ohio and Indiana, and they will, if they can, close our coal mines for the next fifty years.

Some years past the president of the Norfolk & Western Ry. called into his office the coal operators along his line and told them bluntly that they must increase the price of coal 25c. a ton at the mines or he would increase the freight rate 25c. a ton to Atlantic Coast points for the reason that they were shipping too much coal into New England via Lamberts Point and Atlantic Coast vessels and that they were taking the business and tonnage formerly handled by the Pennsylvania R.R.[1]

You will observe no consideration was given to the coal industry of West Virginia or the earnings of the Norfolk & Western Ry., but that the anxiety was to protect the business and earnings of the Pennsylvania R.R. None of us will, I believe, think that the Norfolk & Western Ry. would take such action voluntarily.

Then, about the year 1901, W. M. Page, one of our largest coal operators, desiring to develop valuable coal lands and wishing to have some of his associates in either Baltimore or Philadelphia test the coal, loaded a car of it and billed it out over the Chesapeake & Ohio Ry., and that common carrier refused positively to move this car forward at any price, for the reason that the Pennsylvania R.R. did not permit the Chesapeake & Ohio Ry. to handle coal routed into Eastern cities.

I am wondering if you are conversant with the fact that neither today nor at any previous time in a great many years can coal mined along the Chesapeake & Ohio

---

*Abstract of paper read before the West Virginia Board of Trade, Fairmont, W. Va., Oct. 19 and 20, and entitled "The Coal Crisis."

†Charleston, W. Va.

[1] The president of the Norfolk & Western Ry. Co. in his letter of Nov. 27 emphatically and unequivocally denies having made this statement.

Ry. in West Virginia be shipped into Baltimore, Philadelphia, New York or intermediate cities where it should find the best markets. Not for the reason that the distances are too great. This coal does move into Detroit, Mich., Chicago, Ill., and Minneapolis, Minn., which distances are just as great. Not for the reason that we cannot market coal in territory nearer other coal fields, for West Virginia coal is marketed in and through the coal-producing states of Ohio, Indiana, Michigan and Illinois. But the only reason why our coal cannot be marketed in the Eastern cities is that influence is exerted over the railroads in West Virginia by the Pennsylvania R.R. and its associates to such an extent that our railroads are not permitted to do business where that business will affect adversely the tonnage or earnings of the Pennsylvania R.R.

About the year 1900 the largest railroads, acting with the large coal companies of Pennsylvania, Ohio and Indiana and other large financial interests, directed the principal coal roads of West Virginia to stop by force the development of coal properties in our state, and this policy was undertaken by the roads of West Virginia between the years 1900 and 1904, by tearing sidetracks away from coal tipples, arbitrarily refusing car supplies, refusing car track and switch connections for new developing mines and by other equally illegal methods until the people became so wrought up and so many complaints had been made to the Interstate Commerce Commission and to the courts that the Pennsylvania R.R. Co., the Pittsburgh Coal Co. and others in this illegal combination realized the necessity of discontinuing for the time being those high-handed practices.

A Conspiracy to Cripple by Freight Rates

Then, a few years later, this illegal combination finding that it could, and had for years, kept West Virginia coal out of the Eastern cities, conceived the idea of forcing the West Virginia railroads, against the will and judgment of their operating officers, to increase freight rates on coal to the Great Lakes "for the purpose of keeping West Virginia coal out of the Western market." This question was appealed to the Interstate Commerce Commission, with the result that the efforts of the illegal combination were again frustrated.

Now this same combination, believing that the "pendulum had swung back" in favor of permitting railroads to do as they pleased, has mapped out a plan by which it hopes to force West Virginia railroads to apply such unreasonable charges for the handling of our coal that it will be impossible to market our product in competition with Ohio, Indiana and western Pennsylvania.

And in this connection it seems to me the trunk-line railroads are determined not to permit the Department of Justice of the United States or the various state administrations to give them a rest, for it seems that as soon as the public begins to talk in favor of fair treatment of the railroads, the railroads in turn begin the unfair treatment of the shipping public, as in this case.

We should have no quarrel with the coal operators of western Pennsylvania and Ohio for attempting to have their coal rates reduced if they thought them unreasonably high nor with the Pennsylvania R.R. for keeping its rates up if it can, but when these two interests combine to force up West Virginia rates, which are satisfactory both to West Virginia coal producers and West Virginia railroads, it is high time to fight the increase.

When a few years past the destruction of the coal industry of Ohio was threatened by unwise legislation, the people of Ohio remained indifferent and the "Green anti-screen law" was passed. Then the Ohio railroads, realizing that they might be compelled to lower freight rates, combined with the coal operators of Ohio and western Pennsylvania, and proposed to save the situation by an increase of freight rates on coal shipped from West Virginia. Until then the railroads of West Virginia had not thought of raising freight rates or complained of their being too low.

As an evidence of the fact that the present move to destroy the coal industry of the state is not one involving rates on coal or profits or earnings of West Virginia railroads, or one originating even with the officials of those roads, let us see just what led up to the present proposed demand for higher rates on our products.

Conference at Which Increase Was Planned

A few weeks past an operating officer of the Pennsylvania R.R. and the legal representative of the Pittsburgh Coal Co. arranged with a member of the Interstate Commerce Commission for a conference between them and a "few friends." When the date set for the conference arrived, I am told, there appeared before the Interstate Commerce Commission 11 railroad officials, representing the Bessemer & Lake Erie R.R., the Baltimore & Ohio R.R., the Cincinnati, Hamilton & Dayton Ry., the Chesapeake & Ohio Ry., the Hocking Valley Ry., the New York Central & Hudson River R.R., the Norfolk & Western Ry., the Wheeling & Lake Erie R.R. and the W. P.[1]; 7 coal operators representing western Pennsylvania, 4 from the No. 8 District of Ohio, 2 from the Hocking Valley District, 2 from the Pomeroy District; and 27 or more other railroad officials and coal operators of Ohio and western Pennsylvania.

And they met, not with a view of adjusting freight rates on Pennsylvania or Ohio coal or on the Pennsylvania R.R., but to have the rates on West Virginia coal increased.

These gentlemen by argument or written petition attempted to prevail upon the Interstate Commerce Commission to take such action as would increase the rates on coal from West Virginia without increasing the rate on coals from other states, giving as their reason for this action that it was their desire to bring about a condition of affairs that would give to the coal operators and the railroads of Pennsylvania and Ohio better markets and greater profits and prevent West Virginia coal from being profitably mined north and west of the Ohio River.

It should be borne in mind that at this important conference no West Virginia coal operators were invited or were present, even though it was their business and theirs alone which was under consideration.

It should likewise be borne in mind that this conference of the Interstate Commerce Commission did not originate with, nor was it requested by, the representatives of any railroad of West Virginia or any coal operator of West Virginia, but by an attorney for the Pittsburgh Coal Co. and a vice-president of the Pennsylvania R.R. and of the New York Central & Hudson River R.R., thus showing conclusively that the combination was acting in opposition to the interests of West Virginia.

---

[1] Possibly by W. P. is meant the West Maryland Ry.

The petition filed with the Interstate Commerce Commission states plainly and shows conclusively that the object of these gentlemen and that move were not to benefit the railroads of West Virginia, but to destroy the coal industry of the state and to cripple hopelessly the railroads of West Virginia.

The Ohio operators, taking advantage of the depression in the coal business during the past year, demanded of the railroads and through the Ohio Corporation Commission[1] a reduction in freight rates on coal within the State of Ohio, giving as a reason that the operators of Ohio could not do business in competition with West Virginia operators under present freight rates, notwithstanding the fact that those rates have been in effect in Ohio and western Pennsylvania for a great number of years and that the year 1913 was conceded to be one of the most profitable years to the coal operators and coal industry of that state.

Moreover the production of coal within the State of Ohio has increased under those rates from 18,988,150 tons in the year 1900 to a tonnage of 36,200,527 in the year 1913, or an increase in 13 years of about 90 per cent. This shows conclusively that the coal industry of Ohio was developing satisfactorily until the "Green anti-screen law" was passed by the Ohio Legislature during the winter of 1913. As I have already said, this law put the coal operator of Ohio out of business.

The operators of western Pennsylvania and Ohio set up the plea that it is necessary to increase freight rates on West Virginia product that they may receive a reasonable price for their coal at the mines, but under the present freight rate and transportation conditions which have existed for years the operators of Ohio receive about $1.09 for their coal at the mines and those of western Pennsylvania about $1.12 per ton, while the operators of West Virginia obtain for a much higher grade of coal only about $1.03 per ton, which would not indicate that it was necessary in the interest of fairness to establish a greater differential in the freight charges on coal mined in these several states.

If the controversy now confronting us was one of railroad revenues or earnings and if the railroads of West Virginia actually needed or claimed that they require additional revenue, the question would be entirely different, but the officials of our railroads would not dare to make any such claim in face of their official reports which have recently appeared in print and which show conclusively that they are earning good profits on their investments.

Railroads in West Virginia Are Making Profits

Their stock has increased in value many hundred per cent. in the space of a few years; for instance, the stock of the Kanawha & Michigan Ry. was purchased and sold at about 11c. about 16 years ago, while now it is worth and brings on the market about 88, an 800-per cent. increase in value in 16 years, or 50 per cent. a year. I know of no coal company or other enterprise in the state making such a showing. With the Kanawha & Michigan and Chesapeake & Ohio showing a good net earning on stock that represents no original investment and the Norfolk & Western Ry. showing a net earning of about 8 per cent. on stock that was sold and purchased at five and six dollars a share and now sells for 117, West Virginia railroads could not and do not claim they must have higher rates for necessary revenue. The proposed increased rates must therefore be for some other reason.

If by chance the coal operators of West Virginia could continue doing business under this advanced freight rate, it would be necessary for them to decrease the amount of wages paid their employees and curtail expenses in every other way to absorb this 15c. advance in rate. Thus if they continue to ship coal in the same quantities as at present, there would be an annual loss to the state of this 15c. a ton, or about $11,000,000 annually, so long as this advanced rate was in effect. For the operators of West Virginia do not have it in their power to require the users of West Virginia coal to pay the additional freight charge, as they have no control over the price at which their coal is sold either at the mines or at destination, that being determined entirely by the price at which the customer can purchase coal mined in western Pennsylvania, Ohio and Indiana.

It should be borne in mind during the consideration of this entire matter that it is in no sense a controversy between the coal producers of West Virginia and the railroads of West Virginia, but the contest is really between the State of West Virginia and all its citizens on one side and the Pennsylvania R.R. and the coal operators of western Pennsylvania and Ohio and the State of Ohio on the other side. Therefore every man within West Virginia should enlist in the battle.

West Virginia Selling Coal at Low Prices

It is because of the illegal and criminal combination that West Virginia operators are forced to sell at the mines the best coal in the world at the lowest price in the world. No one will claim, I believe, that this is done voluntarily by West Virginia operators or that they are less aggressive, less intelligent or less capable of coping with market conditions than the operators of other states, but notwithstanding their ability and efforts, their high-grade coal was sold last and previous years at prices which netted West Virginia something like $8,000,000 less than they would have received for the coal shipped out had they been permitted to market their coal under as favorable conditions as some of the other states, which are now claiming that they are discriminated against by the railroads in favor of West Virginia, which is not true.

I believe this board could not do anything which would benefit the State of West Virginia as much as to employ the best attorney obtainable, who would appear for and in the name of the Board of Trade of West Virginia before the Interstate Commerce Commission and defend this state against this great injustice, and further appear before and demand of the Federal Department of Justice an investigation into this entire question and a prosecution and a conviction if possible of the individual men connected with the Pennsylvania R.R., the Pittsburgh Coal Co. and others for their attempted illegal restriction of the commerce originating in West Virginia and passing into other states.

Anthracite Section A. I. M. E.

The Pennsylvania Anthracite Section of the American Institute of Mining Engineers held its fall meeting in Scranton in the clubhouse of the Engineers' Society of Northeastern Pennsylvania on Dec. 4. H. M. Crankshaw, general manager of the Harwood Coal Co., presented a paper on "Mining and Ventilating Thick Pitching Seams." In this he described the methods of working the Mammoth bed which he has introduced at the Harwood colliery and which give a reduction in the cost of extraction, a larger percentage of prepared sizes and an increased recovery.

William Griffith gave a description of the results of tests of models of the mine-roof supports developed by him. These consist of timber cogs filled with concrete. They show great strength and elasticity.

Hugh Archbald exhibited a chart showing the results of some of his investigations into the loss of time at collieries. An investigation of one colliery, extending over a month, showed that the majority of delays in the forenoon were caused by inside troubles, while in the afternoon the larger part of the loss of time was owing to delays in the breaker.

⁂

Freight Congestion at New York

What effect the freight congestion that is enveloping the New York tidewater will have on the coal situation is as yet uncertain, but there is no division of opinion that should the Atlantic coast be visited by severe winter storms the trade will be facing a serious shortage of coal. It is estimated by railroad officials that there are more than 40,000 cars of freight lying on the sidings of the various roads leading to New York. Most of this freight is for export and is held back by the shortage of vessels. Among it are many cars of coal consigned to New York and Philadelphia. It is estimated that one of the large anthracite carriers alone has about 500 cars among the number, and it was also said that about a week ago the Pennsylvania R.R. had 1,800 cars on side tracks waiting an opportunity to move. Shipments along the Baltimore & Ohio were said to be quicker than on some of the other roads.

Shipments from the hard-coal regions, usually requiring an average of three days, now take upward of two weeks. It was also said that some cars of hard coal had been delayed two weeks, although the coal had been for several days within 50 mi. of New York. Shippers of bituminous complain of having boats waiting at the docks for coal. Delay on shipments of soft coal is generally greater than that on hard coal.

Efforts are being made by the railroads to relieve the situation, and to that end a meeting of the presidents and vice-presidents of the railroads reaching New York, Boston, Portland, Philadelphia, Baltimore and Newport News took place in New York last week. The conference appointed a committee of operating officials to deal with the situation. It will seek the coöperation of shippers as well as steamship companies to expedite the movement of export freight.

A committee representing the exporters of the city has also been formed and will confer with the railroad representatives. This committee will make a formal protest to the railroad representatives against the filing of the notice with the Interstate Commerce Commission that on and after Jan. 1, 1916, the number of days of free storage will be reduced from 30 to 15 days.

Embargoes have been declared by the Delaware, Lackawanna & Western on eastbound freight intended for export, except shipments for which vessels have already been engaged, by the Pennsylvania on all flour and lumber for export or to be lightered at New York and by the Baltimore & Ohio on all iron and steel products for export at New York. In addition it is expected that other roads will inaugurate similar embargoes.

How the railroad officials view the situation is set forth in an address made by George Dallas Dixon, vice-president in charge of traffic of the Pennsylvania R.R., made before the International Trade Conference at the Hotel Astor on Dec. 6, when he said:

> The export freight situation which has suddenly developed at the Port of New York is far from satisfactory to the railroads, to shippers and the country generally. The export traffic in the past has grown by leaps and bounds until every transportation company, both rail and water, has found itself unequal to the task of handling it satisfactorily. What will be the situation six months from now if this traffic continues to grow as it has in the past few months? And certainly it is reasonable for us to suppose that it will continue to grow possibly even more rapidly. The American nation must stand ready to help supply the markets of the world, but if we are to do this, we must be prepared.

It is estimated by C. C. McCain, chairman of the Trunk Line Association, that of the 40,000 cars either at the terminals or on the lines consigned to New York, approximately 90 per cent. will require lighterage delivery. Mr. McCain said that no figures that had been submitted showed the number of cars loaded with coal lying between New York and the coal regions.

The Pennsylvania, in a statement issued on Nov. 30, said that at various points in New Jersey there were at that time 2,746 cars of freight for export and lighterage at New York. The Lehigh Valley on Dec. 2 reported having at the New York terminals 3,970 cars of freight undelivered, of which 3,580 cars were waiting for ships. Of these latter, 1,372 cars were unloaded, the contents of 2,014 cars were being held on piers and in warehouses and that of 194 cars had been unloaded on the company's property in Jersey City.

Under date of Dec. 7 the L. V. R.R. issued the following statement:

> The Lehigh Valley R.R. has placed an embargo on shipments of the following commodities consigned to New York harbor delivery: Export, domestic and coastwise shipments of hay and straw. Export, domestic and coastwise carload shipments of wire of all kinds, nails of all kinds, iron and steel rails. Export and domestic carload shipments of locomotives and parts thereof, machinery and all iron and steel articles. Shipments of the foregoing will be accepted which are billed before Dec. 7.

The C. R.R. of N. J. at the same time announced:

> The Central Railroad of New Jersey has placed an embargo on all export traffic, also on hay and straw, and on locomotives and parts thereof, consigned to all New York deliveries. Shipments of the foregoing billed before Dec. 6 will be accepted.

The committee appointed by the railroad presidents also issued a statement under this date as follows:

> The representatives of the several roads advised that there had been an increase of from 400 to 600 cars on their respective lines or at their terminals, as compared with the conditions at the time of the previous meeting. It was ascertained that the embargoes which had been previously announced had relieved certain of the roads only to a limited extent and that the situation as a whole had not been improved and that additional embargoes had been found necessary by the Lehigh Valley R.R. and the Central Railroad of New Jersey.

The Labor Situation

SYNOPSIS—The Rochester & Pittsburgh Coal and Iron Co. closes down the Florence mine as a result of the strike. In Illinois the union decides that the exclusion of militiamen from the mines and the union is unconstitutional. Charles S. Keith testifies at Kansas City that he paid $20,250 for the purpose of corrupting the union. The Colorado Fuel and Iron Co. publishes the list of causes for which men may be discharged without notice.

The employees of the Lawrence and Stanton collieries in the anthracite region, comprising about 1,000 men, went on strike on Nov. 23 endeavoring to make the Harleigh-Brookwood Coal Co., a Madeira-Hill operation, accede to their demands. When the matter was brought before the conciliation board, the men were directed to return to work in three days. The men are then to present their grievance to the company, and if no agreement can be reached, the questions at issue will be heard by the board at its meeting of Dec. 6. The mines have only been in operation a short time, after being abandoned for several years.

Unions Behind in Special Assessment May Vote

The international officers of the United Mine Workers have declared that no local union shall lose its representation at the international convention in January by reason of unpaid special assessments. On Sept. 1, 1913, a special tax was laid upon all members for the conduct of the eastern Ohio and Colorado strikes. This was operative for two months, but by a referendum vote the assessment was extended and remained in force until June, 1915. Many of the anthracite unions because there was no check-off fell behind in the collection of the special assessment, which amounted to 50c. a month per capita. Some unions are behind $6,000 to $7,000, and the men in such unions are glad that their delinquency will not bar their delegates from voting.

The Lehigh Coal and Navigation Co. discovered that Charles Novak, a breaker boss, was selling jobs to foreigners for work under his supervision. He was fined $50 and sentenced to one year's imprisonment.

Some of the workmen having refused to join the union, 1,000 men in the Beaver Meadow colliery of the Lehigh Valley Coal Co. refused to work with them, and the mine closed down in consequence. After being idle two days, the men agreed to return to work pending an adjustment of the matter.

Florence Miners on Strike Are Locked Out

The strike of the men of the Rochester & Pittsburgh Coal and Iron Co. at Adrian and Florence, referred to in the preceding issue of "Coal Age," still continues. On Nov. 30 Lucius W. Robinson, the president, posted a notice at Florence stating that as the men had gone on strike Nov. 22 he would not attempt to operate the mine during the winter. He called on the men to remove their tools. Mr. Robinson recalls the fact that on the signing of the scale agreement of 1912 the Florence employees refused to work under that instrument for several weeks.

The men get much comfort out of the fact that the company declares it is losing $500 to $1,000 a day each day the mines remain idle. They think it is vain for the company to hope that this money will be refunded by the union or the men, and they believe that the assurance of continued loss will make the R. & P. C. and I. Co. anxious to settle. J. P. O'Loughlin, of Clearfield, is the final umpire if the case is submitted to arbitration as the agreement requires.

Attitude of Union to Militia in Illinois

The law forbids any discrimination against men who belong to the state militia. Recently five men were expelled from Local Union 644 for membership in the militia of Illinois, one of the men being a local secretary of that union. This was done under the district constitution, Sec. 26 Art. 14, which states that "any member belonging to a secret-service organization, a private detective agency, the Boy Scouts, the Civic Federation, state militia or National Guard shall be expelled from the United Mine Workers of America."

The men expelled demanded reinstatement in the local, restoration to their positions in the mine and reimbursement from the union for all time lost. Frank Farrington, the president of the district, recommended that these demands be granted, but the local tabled the paper on Oct. 1. On Oct. 4 the five men caused the arrest of all three members of the mine committee and charged them with five violations of Sec. 4 Art. 23 of the Military and Naval Code of the State of Illinois.

On Oct. 16 a committee appointed by the district executive board of the union visited Hillsboro where the men were expelled and proceeded to consider the situation. It reported on Nov. 1 that Sec. 2 Art. 14 of the International Constitution read: "Mine managers, top foremen, operator's commissioners, persons engaged in the sale of intoxicating liquors and members of the Civic Federation or Boy Scout movement shall not be eligible for membership." They held that the district constitution conflicted with this provision, especially since at the first biennial convention of the United Mine Workers of America the constitution committee was asked to recommend the exclusion of militiamen from membership in the union and refused.

The committee held that Sec. 26 Art. 14 of the district constitution was null and void as far as its references to the militia and National Guard were concerned. This decision while open to much question is the best way out of the difficulty and has been approved by Frank Farrington. The committeemen declared that compliance with the law was the better plan, that the charges against the union of lawlessness could only be met by circumspection and obedience in this matter and that to violate the law would give the operators an excuse for violating it also.

Large Bribes Offered to the Union in Kansas

Alexander Howat, president of district 14 of the United Mine Workers, is pressing the suit for slander which was noted in much detail in "Coal Age," page 805. Charles S. Keith, president of the Central Coal and Coke Co., of Kansas City, Mo., testified before a commissioner that he had paid $11,250 on one occasion and $9,000 on another to obtain a favorable clause in the contract with his miners. Mr. Keith was president of the Southwestern Interstate Coal Operators' Association and paid the larger amount in 1910 and the smaller in 1912. His testimony was that the money was given by him to Joseph H. Hazen, an independent coal operator of Mulberry, Kan., for payment to Alexander Howat and Fred Holt, respectively secretary and treasurer of the Oklahoma district.

The contract clause mentioned provided for an arbitrator to pass on questions between the operators and the employees. Mr. Keith testified that H. H. Holmes, a Chicago detective, had first suggested the means of obtaining the desired clause. He then engaged Holmes to obtain it.

Mr. Keith testified that the money, given in check and currency to Hazen, was advanced by the Central Coal and Coke Co. and later paid back by the association. Testimony somewhat similar to this was given when Mr. Keith was sued at Fort Smith, Ark., by the Bache-Denman interests for an accounting of the association funds. Howat denied that he received the money from Hazen, in depositions which he gave then.

Howat's suit is directed against C. S. Keith, J. H. Hazen, W. J. Jenkins, of the Western Coal and Mining Co., Edward E. Riley and Ira M. Fleming.

Costly Blackmailing of a Miner in Oklahoma

Michael Broshears, a miner, brought suit against the Deimal Coal Co., of Dewar, Okla., which blacklisted him. He was without work from Nov. 27, 1914, to Apr. 1, 1915. The company has been ordered to compensate him for every day the mine worked between those dates. The case has been before numerous arbitration boards and commissions and was finally settled when Judge Evans, of Booneville, Ark., acting as third member of the latest board, decided in favor of the miner.

Offenses Meriting Discharge Without Notice

One of the agreements between the miners and the Colorado Fuel and Iron Co. required that the company should post a statement specifying what offenses would be punishable by dismissal without previous notice. The offenses named are violation of law, changing checks on mine cars or loading out another's coal, theft of supplies, changing working place without orders, willfully loading out slate and other impurities with coal, abuse and neglect of animals, intoxication and bootlegging, carrying detonating caps at mines where shotfirers are employed, indecent or immoral conduct, fighting, carrying concealed weapons, three days' absence without permission, except in cases of illness, and sleeping on duty.

Editorials

Contributory Negligence and Assumption of Risk

Two of the features of our common law we have always looked upon with some suspicion—contributory negligence and assumption of risk. It always seemed that if the employer was in any degree responsible for an accident, he should foot at least a part of the bill, and it appeared also that the workingman was really not always altogether aware of the risk he ran or a free agent in accepting it.

So the new Pennsylvania act removing these common-law defenses looked not by any means wholly illogical and unfair, and it had the merit of shifting the burdens onto the shoulders which were broader and better fitted to bear them. With these pious reflections most of us have been willing to admit that the operator who was little if in any way at fault for an accident should pay the whole bill.

But the Court of Appeals in New York has just reversed a decision of a lower court and has declared that when a man turned up his collar, pulled his hat down over his eyes and tried to cross the street and was run down by an auto truck, the company owning the truck should not pay for the loss. He did not use "ordinary care," they say, which is the same as saying he was negligent in a contributing manner. He also must have assumed the risk, or he would not have attempted to cross the street when express wagons were running.

So the courts revive the old common-law defenses in a peculiarly objectionable manner. No one could find fault with the courts for proving friendly to their favorite counsel, but the interesting matter is that those papers that have unsparingly condemned the common-law defenses in the mine and the mill now look upon them as judgments of Solomon—on the street.

And why? The auto-truck man can as readily avoid hitting the pedestrian as the latter can avoid being hit. The contributory negligence is nearly equal, but the pedestrian is a little less negligent than the auto-truck man, for he cannot watch the auto truck without turning his head, while the driver has a good chance to see the pedestrian, because when the two are near one another, the pedestrian is straight ahead and in full view.

In the mine, however, the negligence of the miner is usually about a thousand times greater than that of the foreman. He should be in his place about a thousand times as long and have many times the opportunity to examine the roof. It is not a case of equal negligence of miner and foreman, but of a trifling failure on the one hand and a gross oversight on the other—if of course there is any negligence at all.

Besides, neglect by the foreman even if proved is not as damnatory to the employer as his personal neglect. Negligence in supervision is always a smaller negligence by far than one in action, and if the contributory negligence rule is to be wiped out, it should first exclude cases of negligence in action like that of the truck driver and later extend to negligence in prevision and superintendence. But it appears that the public as usual uses horse-sense about its own affairs and sob-sense about the affairs of others.

The public will be a long time realizing that the same thing constitutes justice for the ordinary individual as for the mill owner and the mine operator. The failure to realize this is why domestic servants and agricultural laborers are excluded by the present act in Pennsylvania, and it explains why the whole battery of the common law may be used to break down the plea of a plaintiff injured on the public street, but may not be raised if he is hurt in a mine or a mill.

⁂

West Virginia Freight Rates

Col. J. W. Dawson has written to *Coal Age* criticizing an editorial which appeared on Nov. 6 and declaring that it was erroneous in that it denied that the Eastern coal trade of West Virginia was threatened by the railroads. Colonel Dawson demands that *Coal Age* meet his declaration that the railroads were proposing to raise rates on Eastern traffic as well as on Western. At the time when the editorial was written Colonel Dawson's remarks in full had not arrived at the editorial desk, and the statement of the editor was based on the excellent, though not complete, brief of Colonel Dawson's paper circulated by the West Virginia operators.

But the reader of the abstract of Colonel Dawson's paper, published herewith, will see that according to his statement the threat to add 25c. to the freight rates East dates back some years. The following letter from L. W. Johnson, president of the Norfolk & Western Ry., in answer to a quotation from Colonel Dawson's communication to *Coal Age* carries its own message:

> I have your letter of the 17th instant, in which you quote a statement which you claim was made by Col. J. W. Dawson, of Ward, W. Va., as follows: "My address at Fairmont stated positively that the president of the Norfolk & Western R.R. had notified the coal shippers along his line that he would probably advance the freight charges on Tidewater business 25c. a ton to prevent their shipping coal in greater quantities into New England."
>
> If the gentleman made such a statement it is false, and I positively deny having made such a statement as I am accredited with.
>
> The shippers on the Chesapeake & Ohio, Norfolk & Western and Virginian were advised that a change in the bunker rates was contemplated, and at their request a conference was held with representatives of the three railroads. After full consideration, the shippers were notified that the proposed tariff would not be filed. This is all there is of it.

It is obvious that an increase in freights east is not now contemplated, so that the menace greater or less to West Virginia trade applies, as *Coal Age* stated, only to the coal directed west. But Colonel Dawson's fears of a general rise in freight rates east and west justify him in his apprehension that the coal trade of the whole state is threatened with restrictions, though it cannot convince him, surely, that it is approaching complete annihilation.

In fact, as recently as Sept. 13 of this year the shippers of the three railroads mentioned in Mr. Johnson's letter were advised that the roads contemplated an advance in rates from $1.40 per gross ton to $1.50 per net ton, which is exactly 25c. per 2,000 lb. ton. After a conference was held in the Philadelphia office of the Norfolk & Western Ry. it was decided by the carriers that they would not file any such tariff with the Interstate Commerce Commission.

Colonel Dawson likewise objects to the intimation that his line of argument does not receive the support of the bulk of the West Virginia operators. Our surmise that they could not approve it he assures us is incorrect and gives some evidence to prove it. So *Coal Age* is obliged with much reluctance to give up the idea that the operators do not view matters from Colonel Dawson's viewpoint.

Colonel Dawson's remarks to the State Board of Trade on the conspiracy between the railroads and coal companies are interesting. There is no reason to doubt that the personnel of the conference as outlined by him is correct. It is quite likely that the railroads feared that the attack of the Ohio operators on the freight rates in that state would result in wrecking the coal-freight trade in Ohio, which is the best business the railroads have in that and every other state. Rather than see Ohio rates reduced 30c. or 40c. per ton as looked probable, rather than face reductions in other states following Ohio's lead, the railroads probably figured with much wisdom that an increase in West Virginia rates would prove a more desirable consummation than a reduction in Ohio and elsewhere.

Possibly the Ohio operators were summoned to find if they would cease their action before the Ohio Public Utilities Commission if the West Virginia rates were increased and perhaps they agreed. No one seems to know. But certain it is that it would be better for West Virginia to suffer an increased rate of 15c. than to face a 30c. to 40c. decrease in the rates of neighboring states without any countervailing reduction in the "Mountain State."

A smaller reduction in West Virginia would probably take place if the rates were reduced as liberally in Ohio as has been indicated, because West Virginia would be driven quite generally from the market by any such differential, and the railroads of the state would have to meet the attack by lowered freight rates. So the railroads would suffer heavily in Ohio, and almost as heavily in West Virginia, because in that latter state coal is almost the only freight. West Virginia operators would not only lose trade, but the railroads would also lose in their receipts per ton of coal hauled as well as in its gross volume. Clearly the change would be helpful to no one but the consumer in neighboring states, and even he would suffer as he always does when business is done without profit.

Perhaps the West Virginia people losing the railroad earnings formerly spent in that state and losing in the declining profits of the operators also will realize that it would be better to leave the matter of the freight-rate increase where it stood. To do so will hurt only the West Virginia coal operators and not the railroads of the state. But the coal men stand to lose whether freights are raised in West Virginia or lowered in Ohio. If under the new arrangement the railroads in West Virginia are compelled to lower their freights, then both in its railroads and in its mines West Virginia will feel the effect of the lowering of the freight rates in Ohio. No wonder if the Pennsylvania R.R. estimated that this would be suicidal and preferred to see prices raised. That there was no conspiracy against West Virginia is shown in its readiness, if the report be indeed true, to raise Pennsylvania rates also so that only Ohio will profit. This will bring Pennsylvania operators who have suffered severely from unreasonable rates into the struggle. The Pennsylvania R.R. apparently is acting solely from opportunism. Ohio is wroth and must be appeased; West Virginia is demanding the present differential and must be mollified. So Pennsylvania must suffer.

It is time for Pennsylvania, not embittered or divided but not yet united, to fight for its right to mine coal and to have a ton-mile freight rate which is equitable. Pennsylvania has suffered from West Virginia competition, and now it is assured that Ohio will be hereafter a more formidable competitor than in the past, and such things will always happen so long as the railroads seek the easiest way and do not establish a ton-mile rate based on the costs of transportation.

But Colonel Dawson, who believes there is a conspiracy between the Pennsylvania R.R. and the Pittsburgh Coal Co., will doubtless be much surprised that the railroad in question has been reported as ready to injure the trade of the Pittsburgh Coal Co. by increasing Western freight rates from the Pittsburgh district. This intention, if really true, argues antagonism rather than conspiracy.

The Ohio operators, both east and south, seem well justified in continuing their action before the Public Utilities Commission as it is likely that only there will they obtain relief. As the State of Ohio will be blind to the destitution beyond its borders, it is likely that its action will not be modified by any sympathy for West Virginia miners or operators. It will be more "thorough" in its action than would for instance be the Interstate Commerce Commission with its larger national responsibilities. And yet that commission recently lowered anthracite rates severely, in one case 80c. per ton.

It would seem that West Virginia would feel safer by far in accepting the rates of the railroads which operate through her valleys and which therefore are interested in her welfare than in depending on the action of a commission in a neighboring state which is simply interested in the securing of reasonable rates in Ohio regardless of the effects elsewhere. The cry of such a commission is, "Hew to the line, let the chips fall where they may." What may happen to the railroad and coal business both when the commission gives its decision might spell the word "crisis" in larger letters than the printer of Colonel Dawson's pamphlet has seen fit to employ.

Colonel Dawson and most West Virginia operators believe that the trouble in Ohio is not from the constant freight rates, but from a variable introduced in the end of 1913—the run-of-mine law. But Colonel Dawson says the trouble in West Virginia will be from the constant opposition of the railroads, not from the variable introduced in 1915—the raised freight rate. As a matter of fact the union and the railroads are together to blame for Ohio's fate, and he would be bold who would mark the proportion. Whether Ohio suffers principally from high wages or high freight rates is a matter of opinion on which Ohio and West Virginia can if they are willing go on arguing forever. A wise man will keep free from such an interminable, inconclusive argument.

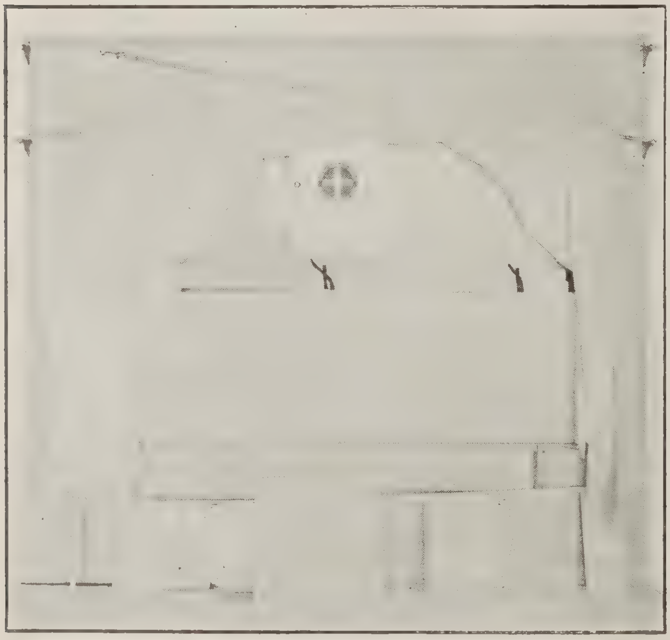
Sociological Department

A Folding Cot Room

Where space is lacking, a folding cot room may be installed which takes up when folded an area of only 6 in. by 7 ft. The illustration shows how the room is arranged. The bed folds back against the wall. The chair, the table and the stool can be collapsed so as to make up the minimum space. Two sides of the room are made by curtains that are suspended from swinging rods, and a light pole resting in sockets at the ends of these rods will sustain a third curtain which, with the wall in the rear, will complete the cot room. The chair, table and stool are enameled in white.

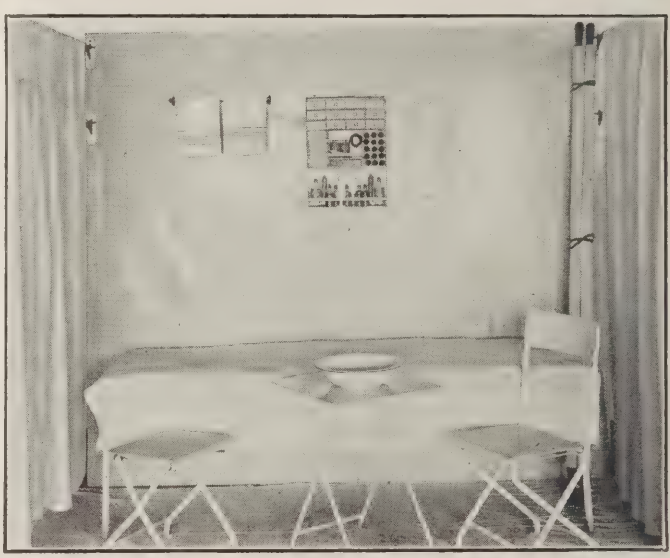
There is of course a first-aid cabinet which hangs against the wall. The box consists, not of tin, but of No. 20 gage auto-body steel, electrically welded, dust-proof and suitably enameled. By reason of its strength the case defies injury. As will be seen, at the top are 12 rolls of absorbent cotton, each in its separate sterile case. On the left are 20 separate packages of 6x36-in. sterile gauze. The central portion contains 2 wire-gauze splints, a package containing 5 yd. of 1-in. adhesive plaster, a rubber tourniquet, 6 cotton applicators in a tube and 12 tongue depressors. The rolls in the right mid-compartment comprise 12 1-in., 6 2-in. and 3 3-in. gauze bandages. Passing through slots in the mid-compartment and suspended in these are nickel-plated scissors and thumb forceps.

The medicaments at the bottom comprise 2-oz. bottles of 3-per cent. alcoholic iodine, of 4-per cent. boric acid, of aromatic spirits of ammonia, of jamaica ginger, of castor oil and 2 3-oz. tubes of burn ointment, composed of vaseline and bicarbonate of soda. A medicine glass and dropper complete the outfit.



INTERIOR OF FOLDING COT ROOM

Instead of a book of instructions a somewhat complete set of suggestions is fixed to the inside of the lid, at the base of which is space for the resident physician's name, address and telephone number. Great care has been taken to keep all the gauzes separate and sterilized. The folding cot room and its whole equipment are manufactured by the First Aid Equipment Co., of 16 East 23rd Street, New York City.



ROOM WITH FIRST-AID EQUIPMENT IN PLACE

⁂

Beneficial Fund of Lehigh Coal and Navigation Co.

The beneficial fund of the Lehigh Coal and Navigation Co. dates back to 1884, when the employees contributed $8,253.61 and the company $9,351.99. The contributions of both remained reasonably constant, and in 1904 the employees were giving $11,440.64 and the company $9,853.66. From that time the employees and company put an increasing amount into the treasury year by year until in 1914 the employees were contributing $37,962.83 and the company $29,439.65.

From 1884 to 1914 inclusive the company paid into the fund $458,253.58 and the employees $468,253.55. From miscellaneous sources $47,074.12 was obtained, but $10,255 was from a sale of securities in 1904. The gross receipts in the 31 years were nearly a million dollars, the actual figure being $973,581.25. By the present date the million-dollar mark must have been largely exceeded.

Benefits have been paid already to the extent of $916,898.92, and the miscellaneous expenses have been $30,111.48, making a total outgo of $947,010.40. The total benefits and expenditures in 1914 reached $982,235.40, which left a balance of $8,654.15 due to the Lehigh Coal and Navigation Co. There was a cash balance in the treasury till 1901. In the years 1902 to 1907 inclusive the fund owed the company money. Then followed three more years when the fund had a balance, but since 1910 the fund has been in debt to the company from $6,043.82 to $9,376.91.

Company Pays 0.8c. per Ton

The present rules of the fund require the contributions to be made monthly, the Lehigh Coal and Navigation Co. giving 0.8c. for every ton of commercial coal produced by the company, the inside workmen contributing 0.8 per cent. of their earnings and the outside workmen 0.4 per cent. But no workman is required to pay more than $1 in any one month. All contributing workmen who may be accidentally injured when actually engaged in the service of the company are entitled to the following benefits:

If the disability lasts more than a week, the injured shall receive half the wages of the class of workmen to which he belongs for a period not to exceed 6 months for any one accident. If, however, the physician of the fund certifies under prescribed regulations that the accidental injury is such as to disable the employee from performing any regular occupation that will enable him to earn half the wages of his class of workmen, then the person so disabled may in the discretion of the trustees receive a sum that will bring his earnings up to an amount not to exceed one-half the wages of his class of workmen for each month of such disability for a period of not more than 24 months from the date of the accident. Claims for benefits not made within 12 months from the date of the accident are considered as absolutely lapsed.

In case of an injury resulting in death, $50 is paid for funeral expenses, and as in case of injury, a sum equal to half the wages will be paid for 18 months from the date of the accident to the widow, orphans or dependent relatives of the deceased or relatives on whom the deceased was dependent, payment being made to any, all or either of them as the board of trustees elects. If there is no widow, orphans or dependent relatives of the deceased or relatives on whom the deceased was dependent, the benefits lapse and the amount remains as a part of the beneficial fund, but so much as is requisite for funeral expenses and proper costs incident to the disability by accident is paid by the trustees. The rules require that when a contributor is killed, notice in writing of the existence of beneficiaries must be served on the trustees within 12 months after such member's death. If this is not done, the nonexistence of such beneficiaries is treated as conclusive and the benefits are regarded as absolutely lapsed. The rules also provide that no disability shall be compensated by more than $50 per month.

Stringent Rules for the Proving of Claims

Benefits are paid only if the foreman of the work at which the employee was injured files with the trustees a certificate signed by him stating the time at which the accident occurred and the fact that the man injured was engaged at that time in the service of the company. Moreover, the physician of the fund must file a certificate with the trustees stating that the accident is such as to disable the man injured or, in case of death, that the cause was not disease but accident. If, however, the man injured feels himself aggrieved by the refusal of the foreman or the physician to sign the necessary papers, he has a right to appeal directly to the board of trustees.

All money paid into the fund must be placed in charge of the board of trustees, which is appointed from time to time by the president of the company, who is requested to choose it partly from the officers of the company and in part from business men of experience and reputation in or near the mining region. The board is required to publish a report of receipts and expenditures at least once a year, and the members receive no pay for their services.

The rules provide that the physicians of the fund shall be appointed from time to time by the vice-president of the Lehigh Coal and Navigation Co. from the practicing physicians in the region. No charge is made for certificates, and the contributors to the fund engage and pay such physicians as they select.

The workmen all contribute to the fund, principally on account of the low benefits assessed. The employees of at least one other company have petitioned to have a similar fund started. But no workman is compelled to contribute to the fund, and after any semimonthly pay he can apply at the Lansford office of the company and receive the sum deducted from his pay. Thereafter no deduction will be made, the man's name will be stricken from the roll of the contributors, and he will not be entitled to any benefit till he has made another payment.

The fund is believed to be ample to meet all claims likely to be made upon it. If, however, it is found that the benefits can be increased, the trustees will have power to make the change.

Compensation Notes

The Iowa act relating to employers' liability and workmen's compensation has been declared constitutional by the Iowa Supreme Court in a decision rendered in the case of George Hunter, a coal miner, against the Consolidated Coal Co., appellant, of Colfax, Iowa. The ruling of the lower court was reversed, the Supreme Court declaring that the coal company had the right to introduce evidence that it was blameless for the injury to Hunter.

Hunter was an employee of the coal company and was injured by a fall of coal while in that employment. The case was tried in the Jasper County District Court, which held that Hunter was entitled to $100 as damages with interest at 6 per cent. from July 24, 1914. The coal company appealed from this decision, alleging that the new employers' liability law under which the award was made was unconstitutional in that it took away from the employer his right to prove to a jury that he was in no way to blame for the accident.

In the lower court Judge John F. Talbott ruled that the coal company could not make such a showing and denied the defendant a jury. The Supreme Court held to the contrary, however, and declared that under the new liability law of Iowa the employer is not precluded from making this defense, pointing out that the lower court erred in not permitting the coal company to come in and give evidence to a jury that it was not at fault. The case was remanded for a new trial on that point.

The Supreme Court says that the employer has the right to defend his case by showing that he was in no wise at fault for the injuries which the miner has sustained and which he charges are the fault of the defendant. In deciding that this defense is forbidden by the act the trial court erred, and for that reason the decision must be reversed. The case is remanded to enable the appellant to make such defense, assuming the burden of proof thereon, and to plead contributory negligence by way of mitigation of damages if advised to do either. In all other respects the decision below was held to be right and the validity of the statute under consideration was affirmed.

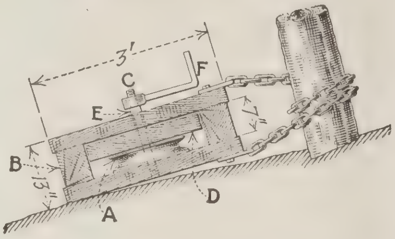
The Supreme Court pointed out that the lower court put a wrong construction on the law when it refused to permit the coal company to present evidence before a jury that it was entirely guiltless and that the injury was the result of the plaintiff's own negligence. The opinion, which filled 90 typewritten pages, is the longest ever filed in the Iowa Supreme Court.

Discussion by Readers

Handling Cars on Pitches

Letter No. 3—Referring to the recent discussion of the methods of handling cars on pitches and in response to the inquiry of Mine Superintendent, *Coal Age,* Oct. 23, p. 687, I am glad to describe for him what we called a "McGinty wheel," which was mounted in a block and chained to a post set at the head of the incline, as shown in the accompanying figure.

In this description I assume a moderate inclination of the seam, the mine being opened by means of a slope driven on the full dip of the strata. Levels or gangways are driven to the right and left of this main slope, and the "McGinty rooms," as we called them, were driven to the rise off the gangways. The success of this method depends on keeping the rooms straight and maintaining a good track. In the case I have in mind, the rooms were driven up as stalls with wide pillars between them, the crosscuts being driven from each room so as to meet about halfway in the pillar. This was necessary in order to reduce the distance of handling the coal in the long crosscuts where no track was laid and cars could not be taken.



"McGINTY BLOCK" FOR SELF-ACTING INCLINES IN ROOMS

When a room was first turned, and until it was driven up about 60 ft., a snubbing rope was used to lower the cars to the level. A post was then set at the head of the room and a McGinty block employed to lower the cars as the room was advanced beyond this point. A double track was laid in each room to permit the empty car going up to pass the loaded car coming down.

The McGinty block shown in the figure consists of an iron sheave *A* 15 in. in diameter and 4 in. wide, having a groove 3 in. deep in its face. This sheave is supported in a strong wooden frame *B* made of 3x12-in. plank. An iron pin *C* 1½ in. in diameter and 18 in. long passes through the center of this block and holds the sheave in place. The pin is prevented from turning by a ½-in. bolt that passes through the sole-piece of the block and a hole bored in the pin, as indicated in the figure. A screw thread is turned on the upper end of the pin to receive the brake handle *F*. As this handle is turned, its shank bears down on a collar or sleeve *E* that surrounds the pin *C* and which, in turn, presses against the brake-block *D,* which serves to control the speed of the wheel and the descending cars. The pipe section *E* is 2 in. in diameter and about 6 in. long. As shown in the figure, the McGinty block is secured to the post by a strong iron chain. The post itself is set in hitches cut in the roof and floor and is tightly wedged. This post is moved up as the face is advanced every 4 or 5 yd.

The first rope used in a room is about 150 ft. in length, the surplus length being wound in a neat coil and laid on the car. When the room is advanced a sufficient distance, another coil 250 or 300 ft. in length is substituted for the old one, which is used in shorter rooms, as required. The length of the second coil is adjusted to the distance the rooms are expected to be driven. This system answers well on pitches varying from 7 to 20 deg.

Average Working Days in Coal Mines

I have been interested in reading the editorial in your issue of Oct. 30, page 715, on the loss of wealth resulting from idle time in the coal mines of the United States, and I note that you have picked out two particularly horrible examples—namely, Arkansas and Oklahoma—as having worked only 174 days during 1913, or about 55 per cent. of the possible working time.

Would it not have been pertinent in this connection to have quoted what has been effected in the anthracite region of Pennsylvania since the operating companies established the custom of allowing the spring discounts. This custom was adopted in 1901 and was for the purpose of inducing consumers to purchase their supplies for the following winter during the discount months when ordinary demand is light and when operation and transportation are not liable to interruption by inclement weather. It was believed, and results have proved the accuracy of the belief, that this would also tend to a more even distribution of the working time throughout the year, so that there would not be so much idle time during the summer and a feverish attempt to keep up with the demand in the winter, with its "peak load."

The reports of the United States Geological Survey show how this scheme has worked out to the benefit of the mine employees. In the 10 years from 1892 to 1901 the average time worked in the anthracite region was 179 days, the fewest days in one year being 150 in 1897 and the largest number 198 days in 1892. The year 1902 is eliminated from the comparison because of the protracted strike in that year, but from 1903 to 1913 inclusive there was only one year in which the average working time fell below the best year in the earlier period.

In 1906, when a suspension of about 60 days pending the renewal of the wage contracts took place, the average number of working days was 195. This was in fact the only year in which the average working time fell below 200 days, whereas in the earlier period there was no year in which as many as 200 days were worked. From the minimum in 1906 of 195 days, the average ranged as high as 257 in 1913, with a mean average for the entire period of 220 days. The average working time since 1903 has exceeded that of the 10 years preceding 1901 by 41 days, or 23 per cent.

To what an extent this has equalized the distribution of the shipments throughout the year is shown by the fact that, in 1913, 50.3 per cent. of the shipments were sent out during the winter months and 49.7 per cent. in the summer months. During the five months of 1913 that the discounts were in effect, the shipments from the region were 28,789,730 tons. Of this amount the sizes above pea that were subject to the discounts amounted to 61.6 per cent., or approximately 17,740,000 tons. As the average reduction per ton during the period was 30c., it can be easily deduced that these concessions cost the operating companies approximately $5,320,000.

Labor in Mining

Letter No. 11—The discussion brought about by Hugh Archbald's article entitled "Why Are Strikes at Coal Mines of Such Frequent Occurrence?" *Coal Age,* July 24, p. 124, shows this to be a vital subject at the present time. The discussion also shows how unanimously the present practices of the United Mine Workers are condemned. I think, however, that those who have discussed the subject have failed to realize, or at least to bring forward, the fact that the union of mine workers has accomplished one aim for which the organization was formed. The primary object of all labor organizations is to increase the rate of compensation per unit of effort, and this has quite generally been accomplished, though usually with loss to the individual.

The average mine superintendent does not object to paying his men high wages. Indeed in some cases, as has been shown, operators have been compelled by the existing wage scale to pay a lower rate for a certain class of labor than they otherwise would. But with the growth of the union and the increase of its power and influence, its officers have adopted many practices that are obnoxious. As S. A. Driver points out in his letter, No. 8, Aug. 28, p. 349, operators do object to the mine workers depriving the owner or his agents of the right to hire and discharge their employees at will. I recall two instances that occurred in my own experience as superintendent of mines in the Southwest, which illustrate this point.

Struck a Large Feeder of Gas

The Mammoth No. 1 mine was our second largest producer. The mine was quite gaseous, and it happened that in driving the sixth-west entry we passed through some faulted coal that developed a strong feeder of gas at the roof. This died out, however, in a few days and was not considered dangerous until a cold spell in December, when so much gas was given off as to give a good cap in a Davy lamp. By the construction of a temporary wooden bridge the entire air current was carried past this point in the hope of diluting and rendering harmless the gas coming from the feeder.

On the morning following the building of this bridge I drove out to the mine and, after talking over the matter with the mine foreman and fireboss, decided that it would be unsafe to work the entry inby of where the gas was given off, except with locked safety lamps. Not having sufficient lamps to give the men, I directed the fireboss to order them out of the entry until the lamps could be obtained. The fireboss did this, walking down the entry to the sixth-west parting, where he established a "deadline."

Demanded the Discharge of the Fireboss

It so happened that the fireboss was *persona non grata* to the pit committee at that time, and the men demanded his discharge, claiming that he had "deal-lined" the entry while the men were still at work therein and that he was therefore "incompetent." Upon my refusal to comply with their request, the miners came out on a strike which was clearly a violation of the union contract. In response to my arguments the union officials said that they would not take the responsibility of ordering the men to return to work under a fireboss who they claimed was incompetent. The state mine inspector being called into the controversy advised me to discharge the fireboss, although he would not openly say that he regarded him as incompetent. As this occurred in the midst of the busy season, the company was rightly demanding coal.

I reasoned that my only excuse for discharging the fireboss would be to say that he was "incompetent," which would mean practically the breaking of the man for holding a similar position in the future. After due consideration, I absolutely refused to grant the men's demands, and following three weeks of idleness, they returned to work under the same fireboss.

Demand for Reinstatement of One Discharged

About six months later the mine foreman discharged the son of this fireboss for alleged carelessness and impudence. In the meantime the pit committee had been changed, and the new committee was now friendly to the fireboss, whose influence resulted in a strike being called, the men demanding the reinstatement of his son. These incidents show the desire of the union to control the employment and discharge of employees of the company at will.

Another incident of a slightly different character illustrates the same point. It occurred at another mine of which I had charge, in the Southwest. The boiler plant at this mine was in bad shape, the boilers were all over 20 years old and much weakened by the fact that the feed water used was strongly acid and a poor quality of slack was burned under the boilers. The conditions at the mine were such that none of these defects could be remedied at the time. The company had but one fireman who could keep steam while the mine was running. He was an exceptionally good man who took an interest in his work and was ambitious to learn.

Object to Fireman's Running an Engine

It had always been the custom at this mine for the hoisting engineer to keep the machinery in repair during idle days and Sundays. This work frequently took him into the mine, and at such times the fireman ran the cage, lowering and hoisting the engineer as required. The fireman was willing and eager to do this, as he hoped eventually to have an engine of his own to run. Strange to say the union objected to this slight matter on the ground that the fireman did not receive engineer's pay while running the engine, although the time when he was thus employed did not amount to one hour a week and the fireman himself had never requested engineer's pay. As the result of the demands of the union, the engineer was forced to climb up and down the shaft when his work called him below. It was frequently necessary, however, to take down a water-end or other heavy part of the pump, and at such times the fireman went down on the cage and the ash wheeler took his place firing in the boiler room.

Even then the union was not satisfied and decided that their "brother" (the fireman) must pay $50 into the treasury of the local if he wanted to work longer in the mines. It is needless to say that the fireman regarded this as outrageous, and not wanting to settle down to the life of a fireman, he resigned his position and went to work on a farm. H. P. SWEENY.

Malcolm, N. S., Canada.

"Dont's" for Mine Motormen

I would like to add two very important "Dont's" to the list given by James Thomas Reynolds, *Coal Age,* Nov. 20, p. 840. They are the following:

Don't stop your motor or trip where it is possible for another motor or trip to run into it, except at a regular station, without going or sending someone back to warn a following trip of the danger.

Don't run by a regular meeting place because the other trip does not happen to be there, without orders from someone in authority or positive and reliable information that the other trip is not coming.

Knoxville, Tenn. EDW. H. COXE.

Prohibition and Welfare Work

Letter No. 6—I remember that C. J. Fuetter, in his Letter No. 4, *Coal Age,* Oct. 2, p. 560, offered a friendly criticism of my statement made in a previous letter, Aug. 28, p. 350, to the effect that "I am inclined to think that there is a certain amount of coddling indulgence permitted in our welfare work among the foreign-speaking miners."

Mr. Fuetter asserts that his experience has taught him that the foreign-speaking miner has no greater desire to be "coddled" than the American miner. His experience may warrant him in arriving at that conclusion, but surely it does not coincide with the well-known practice peculiar to foreigners of showering gifts of fruits, vegetables, wines, etc., on their superiors. In this connection I am reminded of an instance where a general superintendent was obliged to refuse to accept a valuable diamond ring offered him for his wife by an Italian holding a fairly good position under him. The motive in bestowing these gifts may be an expression of gratitude rather than a desire to obtain unmerited favors, but whatever the ulterior motive may be, it is not American in spirit, does not conform to American ideas and should not be countenanced in any form or instance.

AIMS AND PURPOSES OF WELFARE WORK

The mission of genuine welfare work, as I understand it, is to replace in the foreigner with whom we labor and live the old-world habits and ideas that are not consistent with our methods, giving him instead principles of action that will put him on an equal plane with the best in American citizenship. If this is the proper conception of welfare work, how can its aims be better accomplished than by giving to each man a full and complete understanding as to what is expected of him, helping him to acquire the necessary ability to perform his duties and thus standing him on his own feet.

I readily agree with Mr. Fuetter that there is yet much to be desired in the way of welfare work in West Virginia, but my experience with the present forms already existing convinces me that there is little or none of the class distinction of which he speaks. I will cite one or two instances that have come under my observation: At Decota, W. Va., there used to be regular Y. M. C. A. night classes, to which foreigners and Americans belonged. As an incentive to membership and attendance, an occasional supper was served, at which times the general manager, superintendents and other mine officials would rub elbows with their drivers, miners and any other white person who cared to attend.

MUSIC AS A MEANS OF SOCIAL UPLIFT

At another West Virginia mining town there is a band composed of 21 pieces, eight of which are played by foreigners, and some of these men have shown exceptional musical talent. The director of this band, an accomplished musician, is an official of the operating company and willingly devotes his time to this work without remuneration of any kind.

Such social intermingling as this surely shows a democratic spirit, and as these people are of a very assimilative nature, its results are soon visible, and the good effect is shared by the entire community.

An eminent engineer in speaking on this subject used the following quotation: "Sow a thought and you reap a habit; sow a habit and you reap a character; sow a character and you reap a destiny."

F. S. JOHNSON, Chemist,
Coalton, W. Va. Davis Colliery Co.

Efficient Mine Foremen

Letter No. 13—I read with much pleasure the letter of Wm. Crooks on this subject, *Coal Age,* Sept. 4, p. 394, and can say that the time will not be wasted by anyone reading the same. It recalled to mind the time when I worked in the mine of which Mr. Crooks took charge when it was very much run down by reason of the man who preceded him having spent most of his time in the tophouse. So bad was the condition of the mines that the men could not work more than half a day. In a short time, however, the conditions were so improved that the miners worked all day and came out in the evening remarking on the good condition of the air in the mine.

GOOD AIR STOPPINGS SHOW FOREMAN'S EFFICIENCY

This reminds me of another incident in my own experience: I took a position as trackman and bratticeman in a mine where the air was very poor owing to leaky stoppings. Being sent to repair these stoppings, I found no lumber and suggested to the boss that he let me build rock stoppings, as there was plenty of refuse at hand for that purpose. He replied that he did not want any rock stoppings as they gave too much trouble.

After waiting a long time for the lumber, the air became so bad that men could not work long in their places. Others were hardly able to get home after coming out of the mine. The boss wanted to know what was the matter, and I took him into the mine to show him where the air was leaking through the board stoppings.

After some persuasion, he allowed me to build a few rock stoppings, on my promise not to draw any pay for the time if the results were not satisfactory. I built the stoppings, packing them well with fine dirt so as to make them air-tight. The result was that in a short time there was good air at the face. After that I was given the position of fireboss, but when the foreman wanted to make a change and have me build brattices at the same time, I looked around for another place.

When a Mine Foreman Is Not Responsible

In a neighboring mine where I found employment the foreman had so large a territory that he could not give it the proper attention, and the work he ordered was not half done, as the men were inclined to do very little when not watched. As a result, in this mine also, the air current was almost completely lost before reaching the face. The foreman applied to the manager for an assistant. Although it was evident that there was more work than one man could look after, hoping to save expense the manager refused to give the foreman the assistance he needed.

Later, when an assistant was appointed, the condition in the mine was such as to require two assistants to look after the work and see that it was properly done. I hope to live to see the time when there will be a law restricting the foreman to the charge of a single opening. In the case I have just cited it was not the foreman's fault, but the manager was to blame for not giving him the help needed. Under these conditions a good mine foreman will generally give up his place rather than be responsible for permitting the mine to run down while in his charge.

Need for Every Man to Do His Duty

In conclusion, I want to say that if every man in the mine would do his duty it would be comparatively easy for a foreman to handle a large territory. Experience shows, however, that the majority of miners will slight their work in order to make it appear that they complete a job in less time than other men. When such work is inspected, it is generally found that it will cost more to remedy the trouble than it would have cost to have done the work properly in the first place. If the foreman spends much of his time in the tophouse and leaves work that he should look after in the hands of his assistant, which is often the case, he is responsible for the poor work done, since the assistant devotes the most of his time in that case to putting out the coal, which he knows will please the foreman. In order to determine, therefore, whether a mine foreman is efficient, it is necessary to watch the daily operation of the mine closely.

Warrior, Ala. L. J. Wright.

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

AIR

Little was known of the aërial envelope that surrounds the earth, until the researches of Cavendish and Priestley in England and Lavoisier in France, in the latter part of the 18th century showed that air was **not an element,** as had been supposed, but a mechanical mixture of gases.

Up to this time, air and all combustible material was believed to contain a certain substance called **"phlogiston,"** which escaped as flame when the substance was burned. Both Cavendish and Priestley held this phlogistic theory even after they discovered the complex nature of air. Hence, the name "dephlogisticated air" was applied to oxygen; while hydrogen was called "inflammable air" and carbon dioxide "fixed air."

It remained for Lavoisier to expose this fallacy by showing that no matter was lost, but the weight of the products of a combustion was equal to that of the combustibles burned. A large number of carefully made analyses showed a practically constant proportion of the two chief gases of which air is formed. This seemed to suggest that the oxygen and nitrogen of the air were chemically united, although the proportion of each gas did not correspond to its combining power as determined by the analyses of well-known chemical compounds. The character of air as a **mechanical mixture** thus became definitely established.

Besides the two principal gases oxygen and nitrogen that constitute the air we breathe, there are other gases whose presence in the atmosphere is of much vital importance, although their proportion is small. Of these may be mentioned carbon dioxide, water vapor, ammonia, argon and ozone.

Carbon dioxide is most important, because of its toxic effect on the human system. This effect, it is stated on the highest authority, increases with the barometric pressure. Thus, for example, air containing but 1 per cent. carbon dioxide, at a pressure of 4, 5 or 6 atmospheres produces the same effect on the respiratory organs as air containing 4, 5 or 6 per cent. of the gas at a pressure of 1 atmosphere. In other words, **the true gage** of the effect of this gas in inspired air is the percentage of the gas multiplied by the number of atmospheres.

Water vapor present in the atmosphere breathed has a marked effect on the vital activities and the consequent development of physical energy in the body. In what manner the relative humidity of the inspired air operates to impair the physical force has not been fully explained; but experience has shown that a high degree of humidity in a warm atmosphere or climate has an extremely weakening effect on the human system.

The association of **high humidity and temperature** marks a comparatively large amount of water per unit volume of air and, to that extent, it may be assumed impairs the respiratory functions of the lungs. The result is to incapacitate men exposed to such conditions and render them wholly or in part unfit to perform the required manual or mental labor. These effects are continually observed in the warm moist atmosphere of deep mine workings and other similar places.

The Coal Age Pocket Book

The Respiratory System—Respiration is the prime means of maintaining the vital action in animal organisms. Its objects are twofold: 1. The **oxidation** of the organic matter of the animal tissues with the resulting development of vital energy. 2. The **removal** of the carbon dioxide produced in the process of oxidation. Both of these processes are performed through the medium of the blood.

The Circulation—Under the action of the respiratory system, the blood flows from the heart into and through the arteries of the body, as water flows through a circulating pipe system under the action of a pump. The pulsations of the heart, corresponding to the strokes of the pump, force the blood through a complex system of arteries and veins to every portion of the body and limbs.

All the blood does not flow in a continuous circuit, but the arteries branch, forming separate channels leading to different parts of the body. The time required to complete a circuit and return to the heart is obviously widely different, varying from 20 or 30 sec. to one-fourth as many minutes. This is of interest in relation to the time required for poison entering the blood to be disseminated throughout the system.

Respiratory Action—The action known as "breathing" originates or, at least, is regulated by a nerve center at the base of the brain from which impulses are transmitted through the spinal column to the respiratory muscles. By this means air enters the air cells of the lungs and oxygen, absorbed therefrom by the red corpuscles (hæmoglobin) of the blood, is carried by the circulation to the tissues of the body, where it is consumed with the production of carbon dioxide. This gas is absorbed by the blood and carried back through the veins to the heart and lungs, where it gives up a portion of its gas, which enters the lungs and is expelled by each succeeding exhalation.

While air expired by a healthy adult, at rest, contains from 2 to 3 per cent. carbon dioxide, careful determinations show a constant production of 5.6 per cent. of this gas in the lungs when the person is at rest.

Quantity of Oxygen Consumed in Breathing—A man at rest consumes 263 cm.^{3} of oxygen per min., or $263 \times 0.06102 = 16$ cu.in. per min. and exhales an equal volume of carbon dioxide. Air exhaled from the lungs contains 2.6 per cent. carbon dioxide, 18.3 per cent. oxygen, 79.1 per cent. nitrogen. In violent exercise, a man consumes from eight to nine times the amount of oxygen required when at rest; or, say 128 to 144 cu.in. per min. The exhaled breath may then contain 6.6 per cent. carbon dioxide and only 14.3 per cent. oxygen.

Depletion of Oxygen in Air, Effect on Life—Air containing 3 per cent. carbon dioxide can be breathed without discomfort, even when the oxygen content has been reduced to 16 per cent.; but 5 per cent. carbon dioxide causes headache, dizziness and nausea, after a short time. When no carbon dioxide is present in the air the oxygen content may fall as low as 14 per cent. before much difficulty is experienced in breathing; but air containing but 10 per cent. is no longer breathable; but will cause death quickly by suffocation.

Inquiries of General Interest

Calculation of Relative Humidity

Will you kindly give me a formula or explain a practical method for calculating the relative humidity of air directly from the readings of the wet- and dry-bulb thermometers, without the use of hygrometric tables. I am familiar with the method of calculating the relative humidity of air from the saturated-vapor pressures corresponding to the hygrometric readings, but this necessitates reference to the tables, which I wish to avoid. Say, for example, the dry-bulb reading is 70 deg. F. and the wet-bulb 63 deg. F. Is it possible to calculate the relative humidity of the air directly from these readings without referring to the tables I have mentioned?

Cokedale, Colo. MINER.

In estimating the degree of humidity of the atmosphere from the readings of the hygrometer, it is customary to use hygrometric tables which show the saturated-vapor pressures at different temperatures. In the use of this method the actual vapor pressure for any degree of saturation or any dry-bulb reading is first found by dividing the difference of the two readings by a constant 88, multiplying the quotient by the ratio of the barometric reading to the average sea-level barometer (30 in.) and subtracting this product from the saturated-vapor pressure corresponding to the wet-bulb reading. This is expressed by the following formula:

$$p_v = p_w - \frac{B}{30}\left(\frac{t_d - t_w}{88}\right) \qquad (1)$$

The relative humidity H is then found by multiplying the actual vapor pressure p_v by 100 and dividing by the saturated-vapor pressure corresponding to the dry-bulb reading taken from the tables, as expressed by the formula

$$H = \frac{100\, p_v}{p_d} \qquad (2)$$

Applying these formulas to find the relative humidity in the case cited by the correspondent and assuming a barometric pressure $B = 30$ in., the saturated-vapor pressures corresponding to the dry and wet readings, as taken from the tables, are $p_v = 0.7335$ and $p_w = 0.576$, the corresponding temperatures being $t_d = 70$ deg. F. and $t_w = 63$ deg. F. For the actual vapor pressure we then have, from formula 1,

$$p_v = 0.576 - \frac{30}{30}\left(\frac{70 - 63}{88}\right) = 0.576 - \frac{7}{88} = 0.4964 \textit{ in.}$$

Then, applying formula 2 for the relative humidity, we have

$$H = \frac{100 \times 0.4964}{0.7335} = 67 \textit{ per cent.}$$

No formula has as yet been published, to our knowledge, by which the percentage of humidity can be calculated directly from the wet- and dry-bulb readings of the hygrometer without reference to the tables previously mentioned. We would suggest, however, that fairly approximate results can be obtained for sea-level readings by the use of the following formula, though it requires a knowledge of logarithms, owing to the decimal exponent. In this formula the 0.84 power of the difference of the readings is divided by the dry-bulb reading and the quotient obtained multiplied by the absolute zero of the Fahrenheit scale. The resulting product subtracted from 100 gives the percentage of moisture or the relative humidity of the air. Thus,

$$H = 100 - 460\frac{(t_d - t_w)^{0.84}}{t_d} \qquad (3)$$

Assuming sea-level observations (bar. 30 in.) and substituting the values previously given, $t_d = 70$ deg. and $t_w = 63$ deg., we have for the relative humidity,

$$H = 100 - 460\frac{(70 - 63)^{0.84}}{70} = 66.3 \textit{ per cent.}$$

Again, assuming a sea-level barometric pressure of 30 in. and hygrometric readings, $t_d = 65$ deg. and $t_w = 45$ deg., and finding the relative humidity corresponding to these readings by formulas 1 and 2, since the corresponding saturated-vapor pressures taken from the tables are $p_d = 0.6176$ and $p_w = 0.2995$ in., we find for the actual vapor pressure, applying formula 1,

$$p_v = 0.2995 - \left(\frac{65 - 45}{88}\right) = 0.0733 \textit{ in.}$$

Then applying formula 2, we find the relative humidity,

$$H = \frac{100 \times 0.0733}{0.6176} = 12 \textit{ per cent., nearly.}$$

Finding the relative humidity in this case by the use of formula 3, as proposed, we have

$$H = 100 - 460\frac{(65 - 45)^{0.84}}{65} = 12+ \textit{ per cent.}$$

The formula (3) given above is in no respect a rational formula, but has been derived by observation of hygrometric tables and gives a fairly close approximation to the percentages of humidity obtained by the use of the tables, while the calculation is much shorter. As stated previously, however, formula 3 can only be applied to sea-level observations.

The question of the effect of barometric pressure on the relative humidity of air is an interesting one and worthy of careful scientific investigation, with a view to developing a rational formula that will enable the calculation of the relative humidity of the atmosphere directly from the wet- and dry-bulb readings of the instrument. It will be observed, in this connection, that formula 1 is not a rational formula, since it depends on the empirical constants 88 and 96, the latter being used for dry-bulb readings below 32 deg. F.

We would be glad to have readers of *Coal Age* give this question careful consideration and send us the results of their investigations, as the question submitted is one of practical interest to all engaged in mining work.

Examination Questions

Tennessee Examination Held at Knoxville, Nov. 23-25, 1915

(*Selected Questions*)

Ques.—What is a creep as applied to coal mines?

Ans.—A "creep" in coal mining may be described as a peculiar movement or disturbance of the strata overlying the mine workings from which the coal has been extracted without leaving sufficient pillar coal for the support of the overburden or without providing for the gradual settlement of this burden on the waste material stored in the space from which the coal has been taken.

Creep is manifested by the "nipping" or chipping off of small particles of coal from the upper portion of the pillars close to the roof. As the creep proceeds, the pillar coal becomes more or less crushed. Timber sets are crushed and broken like pipe stems, with the progress of the creep. Where the pillar coal is hard and the bottom soft, creep is manifested by the heaving of the bottom in the open space between the pillars, both in the rooms and on the entries. Creep is best prevented by proportioning the width of the pillars to the size of the openings, with due regard to the thickness of the seam, its depth below the surface and its inclination.

Ques.—In developing a mine, how would you be guided as to the size of pillars along main entries and airways?

Ans.—The width of pillars flanking the main entries and airways will depend largely on the method employed in developing the mine. In the room-and-pillar system the width of these pillars is determined by the depth of cover, nature of the overlying strata, thickness and inclination of the seam, hardness of the coal, roof and floor and the length of time required for the extraction of the coal and final settlement of the roof in the vicinity of the pillars.

As a guide, under ordinary conditions in flat seams, the width of main entry pillars may be taken as one-fourth of the square root of the continued product of the depth of cover, thickness of seam and width of opening, all expressed in feet. Thus, for a depth of 200 ft. below the surface, the main-entry pillars in a 5-ft. seam of commonly hard coal, for rooms 24 ft. wide, may be taken as $\frac{1}{4}\sqrt{200 \times 5 \times 24} =$ say 40 ft. Conditions in respect to the nature and hardness of coal, roof or floor and inclination of seam may increase the width of these pillars.

Ques.—How should aircourses be maintained so as to get the best results from the ventilating power?

Ans.—It is important in this relation to keep the aircourses free of every obstruction that will prevent the free passage of the air current. They should be timbered sufficiently to prevent roof falls or the undue sagging of the roof, and all refuse should be cleaned up at regular intervals. Every effort should be made to keep the aircourses as straight as possible and to avoid sharp bends. Breakthroughs or crosscuts at the head of a pair of entries should have the same sectional area as that of the airways and be kept free of all obstructions. A most important point in maintaining airways so as to obtain the best result is to build substantial stoppings in all crosscuts that are closed to the passage of air. These stoppings should be sealed so that they are practically air-tight. Also, all doors and air bridges should be made as air-tight as possible to prevent the leakage of air at such points.

Ques.—Explain fully the different systems of ventilation and the benefits to be derived from each.

Ans.—The several systems of ventilation in mines may be described as: (1) Natural ventilation, which is produced by a natural air column formed in a shaft, slope or in dip workings in mines, owing to the difference of temperature between the intake and return aircourses. (2) Furnace ventilation, which is produced by heating the air in an upcast shaft by means of a furnace located in the mine close to the foot of the shaft, thus producing an air column that causes a ventilating pressure in the mine. (3) Fan ventilation, which is divided into two systems known as the exhaust and the blowing systems of ventilation. In the exhaust system the mine is ventilated under a pressure less than that of the atmosphere, while in the blowing system the mine pressure is above that of the atmosphere.

The benefits of natural ventilation consist in making use of natural agencies for producing an air current in the mine and thus avoiding the expense of installing special apparatus for that purpose. The benefits of furnace ventilation are chiefly manifest in deep shafts, where the higher temperature of the furnace shaft produces a high ventilating pressure at a comparatively small cost.

The benefits of fan ventilation are a better control of the ventilation in the mines during all atmospheric changes and the ability to increase or decrease the circulation of air in the mine by changing the speed of the ventilator. The exhaust system of ventilation is particularly applicable to gaseous mines, where it is desirable to perform the haulage on the main-intake aircourse. Such an arrangement makes it necessary to adopt the exhaust system and place the fan at the return opening of the mine. The blowing system of ventilation is particularly adapted to large mines, especially where there is much abandoned area that generates more or less gas that would find its way into the main-intake current if the exhaust system was used and the mine ventilated under a pressure below that of the atmosphere. When the mine pressure is above that of the atmosphere, the gases generated in these abandoned areas are forced back and frequently find vent through crevices and breaks extending to the surface.

Ques.—What is air?

Ans.—Air is the more or less constant mixture of gases surrounding the earth; in other words, the atmosphere that sustains life. It consists chiefly of nitrogen and oxygen gases, in the ratio, by volume, of 4 : 1, with small amounts of carbon dioxide, moisture, etc.

Coal and Coke News

Harrisburg, Penn.

The vocational bureau of the State Department of Public Instruction is coöperating with the various municipal school boards throughout the state preparatory to the establishment of continuation schools in compliance with the Cox Child Labor Act which becomes effective Jan. 1. This act provides for a compulsory school attendance for a minimum of 8 hr. a week between 8 a.m. and 5 p.m. on any day of the week except Saturday.

Supervisors of state industrial education and field workers are directing a canvass of all mining companies and manufacturers employing minors between the ages of 14 and 16 years. Nearly all the employers interviewed, with the exception of the larger coal companies will retain the minors in their employ after Jan. 1. It will be necessary for some to make slight readjustments in their operations to give every minor 8 hr. a week to attend continuation school. The employer is not compelled to pay the minors for the time they attend school.

The continuation school will be in session the same number of weeks a year as the regular schools of the district. Each pupil attending the continuation school may attend for a period of 8 hr. on one day, 4 hr. on two days, or 2 hr. on four days, per week.

If it is advisable, all the schooling may be given continuously, provided a total number of hours of schooling received by each minor in the continuation school be equivalent to 8 hr. a week for the number of weeks which the regular school is in session. These continuation schools may be conducted in a public school building, or in the establishment in which the minors are employed, or in other suitable buildings.

Insurance Rating Bureau Is Organized

Organization of the Compensation Insurance Rating Bureau of Pennsylvania, the aim of which is to provide uniform classification and rates for liability insurance under the Workmen's Compensation Act, was begun this week with the adoption of a constitution by representatives of 18 of the 32 companies authorized to do casualty business in this state. A board of managers has as yet to be named before organization is completed. Headquarters, it is understood, will be opened in Philadelphia.

Membership in the bureau is open to any company or corporation authorized to issue policies of insurance within the provisions of the Workmen's Compensation Act, and this includes the State Insurance Fund. Under the constitution, the State Commissioner of Insurance is ex-officio a member of all committees of the bureau.

The bureau, it is explained, will bear the same relation to the conduct of employer's indemnity insurance in Pennsylvania as the Underwriters' Association does to the fire-insurance business. One of the first moves to be made by the central board will be to promulgate a manual of rates under the different classifications of risks, based on the merit system. The introduction of uniform rating and inspection system is expected to furnish the insured with an incentive for safeguarding his workmen in every possible way, as under the merit plan the rates are based solely on the hazard involved.

Francis Rawle and J. W. Henderson, counsel for the Italian consulate in Philadelphia, appeared before the Workmen's Compensation Board during the week to discuss the forms to be adopted for establishing proof of death of Italian workers in Pennsylvania, and what proofs will be required by the board to determine the dependents in Italy of workers killed in this country. The representatives of the consulate state that there are about 400,000 Italians in Pennsylvania, many of them working in coal mines.

The Workmen's Compensation Board has received assurance that the United States Steel Corporation will give its complete coöperation in complying with the Workmen's Compensation act in this state. The subsidiary companies in Pennsylvania, include the Carnegie Steel Co., National Tube Co., American Bridge Co., American Steel and Wire Co., American Sheet and Tin Plate Co., Pittsburgh, Bessemer and Lake Erie R.R. Co., and the H. C. Frick Coke Co.

The Steel Corporation in its letter gave the Workmen's Compensation Board the following assurance: "I wish to assure you, although I think it is quite evident, that it is the disposition of the Steel Corporation and its executive officers without exception, to do all in their power to comply, not only with the letter, but the spirit of this law."

PENNSYLVANIA

Pittston—The Lehigh Valley Coal Co. has commenced pumping the water from the abandoned No. 6 slope at Yorktown preparatory to remining the old workings.

Shannandoah—A number of collieries in this district have recently been idle on account of a lack of empty cars. If it had not been for this factor the workingmen in the coal region would have experienced one of the most prosperous Christmas seasons on record. Even as it is the amount of money paid out in wages by the mining companies to their miners and other employees has been much larger than ordinary.

Dunmore—One man was killed and four more were injured in an explosion of gas at 9:30 o'clock on the night of Dec. 3, in the Underwood colliery of the Pennsylvania Coal Co. Two of the four are probably fatally injured. An Italian miner set off a blast in a gas-filled crosscut just after he had been warned by the fireboss not to shoot. The fireboss, Patrick McKane, is the most seriously injured of the four who were sent to the hospital.

Hazleton—The city assessors have recently increased the valuation of all property from 30 per cent. to 50 per cent. and the Lehigh Valley Coal Co. has appealed to city council that the valuation on 552 acres of coal land owned by the company within the city limits is entirely too high. It is likely that the case will be carried to the courts in case the appeal is not allowed by the city officials.

After having been abandoned about a quarter of a century on account of water accumulating faster than the pumps could remove it, the Yorktown No. 6 slope of the Lehigh Valley Coal Co. is about to be placed in operation. With powerful modern electric pumps no particular difficulty is expected in clearing the mine and thus developing this large deposit of coal.

Lansford—The Lehigh Coal and Navigation Co. is installing a new machine at No. 14 water hoist. It is to be operated by a 1,200-hp. induction motor, taking 25-cycle current at 2,300 volts. It will hoist a load of about 50,000 lb. through a distance of 865 ft. and deliver water at the rate of 180,000 gal. per hour.

Bituminous

Connellsville—The production of coke in the Connellsville region is practically stationary at about 435,000 tons. An insufficiency of labor prevents an increase in this production.

Leetonia—The coke plant of the Cherry Valley Iron Works of the United Iron and Steel Co., at Leetonia, consisting of 198 ovens, has been placed in full operation after being idle since Jan. 1 last.

Tarrs—The Southwest plant, better known as "Old Red Top," of the H. C. Frick Coke Co., has been fired after a shutdown of several months. There are about 124 ovens at "Old Red Top" and when in full operation the plant will employ approximately 120 men and boys. It is also rumored, but the rumor has no confirmation, that the Old Valley Works of the same company will also be revived.

Barnesboro—Fire destroyed the tipple at the Kinport mine of the Hastings Coal and Coke Co. on Dec. 3. The origin of the fire is not known. The fire had a good start before the firemen arrived, but they were able to prevent the destruction of the big supply house and adjoining buildings. As a result of the fire the mines will be closed for some time.

Punxsutawney—The Rochester & Pittsburgh Coal and Iron Co. has posted notices of the closing of the Florence mine for the winter on account of labor troubles. Recently 500 men struck for an increase in wages and the company took the stand that the men had violated the agreement entered into by the miners' union. Not being able to reach an understanding it was decided to suspend work indefinitely.

WEST VIRGINIA

Charleston—A petition in involuntary bankruptcy has been filed in the United States District Court against the Davy Pocahontas Coal Co., of McDowell County. The Graham Manufacturing Co. is one of the petitioners. The coal company operates several mines along the N. & W.

Boomer—The work of recovering the bodies of the victims of the recent mine explosion at Boomer has been completed, and the mine will shortly begin operation. It will probably be some little time, however, before the working of this mine settles down to its normal course.

Huntington—Coal shipments over the Chesapeake & Ohio R.R. lines during November showed a decided increase over the month of October, and also the corresponding month of last year. It is stated that 2,417,870 tons of coal were carried during the month, this being an increase of about 100,000 tons over October and 600,000 tons over the same month of 1914. Officials of the railroad are elated over this increase.

Wheeling—The 3-ton cage at the Glendale mine of the Hitchman Coal and Coke Co. recently broke its hitchings and plunged to the bottom of the shaft, a distance of about 100 ft. The cage was loaded with an empty mine car and both cage and car were thoroughly demolished. Four men were near the foot of the shaft when the cage let go, but were at such a distance that none were injured. A new cage has been constructed and work resumed.

KENTUCKY

Whitesburg—Superintendent M. Sergeant and Assistant Superintendent P. F. Pillins, with other officials of the Lexington & Eastern Branch of the Louisville & Nashville, recently made a trip of inspection over the North Fork extension through the Elkhorn coal fields with a view to putting on additional trains to meet the rapidly increasing traffic, owing to the activity of the coal mines around McRoberts, Fleming, Hamond, Seco, Kona and other points.

Frankfort—A record of accomplishment in the way of keeping down forest fires this season is reported from the office of state forester, J. E. Barton. During the season which closed on Dec. 1, there were only 24 fires. The good work is credited to the county fire wardens. All extra employees of the service were discharged on Dec. 1.

OHIO

Columbus—Judge Kinkead, of the county courts, recently granted judgment aggregating $18,000 against the Sunday Creek Coal Co., and in favor of the New York Coal Co. The judgments were granted in four of a series of suits filed by the New York company against the Sunday Creek company, growing out of coal lands which the former had leased to the latter under royalty agreements.

Bellaire—The Johnson coal mine, at Pipe Creek, recently resumed operations after having been idle since the beginning of the Eastern Ohio coal strike, nearly two years ago. About 100 men were put to work. When operating full force the mine employs nearly 300 men. The present complement will be increased from time to time during the ensuing weeks.

ILLINOIS

Nokomis—Installation of the new Rutledge & Taylor Nokomis mine has been completed. The shaft is on the Big Four and the Chicago & Eastern Illinois railroads.

Duquoin—Trustees of the estate of the late Henry Horn, Sr., mine owner and banker, are disposing of the mining property, real estate and business buildings to satisfy the claims of the depositors in the Henry Horn bank, which failed more than a year ago. The business buildings have been closed out at $65,000. The mine and coal lands will be sold in a short time. It is expected that more than $100,000 will be realized and that the creditors will receive about 30c. on the dollar.

Belleville—Operators of the Belleville district have started a movement for the readjustment of the mining scale for the purpose of removing the disadvantage under which the district now suffers by reason of lower mining prices and favorable railroad rates enjoyed by the Franklin, Williamson and Saline County fields, about 100 mi. south of Belleville. The miners are paid 61c. per ton for mining in the Belleville district, while in the southern Illinois field the wage is 75c. The favorable rate was allowed to the southern Illinois field two years ago on account of a disparity of railroad facilities then existing. Since that time the Southern field has obtained better facilities than the Belleville field. In addition, the southern Illinois field now enjoys the same freight rate to St. Louis as the Belleville field. It is claimed that mining properties in St. Clair and Madison counties have been unproductive for two years on account of these disadvantageous conditions.

IOWA

Des Moines—On Saturday, Nov. 27, 3,000 coal miners in Des Moines and Polk County drew their pay for the last half of November, amounting to $100,000. Practically every mine worker in the county was in Des Moines. Each man drew from $35 to $50. The men are now working on full time.

PERSONALS

Governor Henderson, of Alabama, has just appointed W. H. Thompson, of Piper, as associate mine inspector to succeed T. H. Teinney, resigned.

G. E. Alloway, formerly with the Banks Supply Co., has accepted a position on the sales force of the Ironton Engine Co., and will make headquarters at Ironton, Ohio.

Col. R. A. Phillips, who has for many years been connected with the Lackawanna coal company, has resigned the position of general superintendent on account of failing health.

J. H. Anderson, formerly with the Consolidated Coal Co., and later with the Northern Coal Co., has joined the selling force of the Peabody Coal Co., and will travel in Missouri and part of Illinois.

James Summers, of Hazleton, Penn, electrical and mining engineer, has taken a position with the Ironton Engine Co., Ironton, Ohio, as mining engineer and will be located at the plant at Ironton, Ohio.

Daniel B. Wentz, of the firm of J. S. Wentz & Co., coal operator, has been elected to the directorate of the Franklin National Bank, one of the three most important financial institutions in the city of Philadelphia.

J. J. Wolfersperger, of Pallas, Routt County, Colo., has resigned as superintendent of the Yampa Valley Coal Co.'s mine at that place, effective Dec. 22, after which date he will spend a month in Chicago and Evanston, Ill.

Robert Erskine, of Cinderella, Mingo County, W. Va., was recently appointed District Mining Inspector of the 12th District of that state, succeeding Isaac Murray. Mr. Erskine will have his headquarters at Bramwell, in Mercer County.

A. C. Lammont, of Scranton, chief mining engineer of the Delaware, Lackawanna & Western R.R., was appointed, Dec. 6, general superintendent of the mining operations of the company, succeeding Col. R. A. Phillips, resigned on account of ill health.

Dr. J. A. Udden, geologist of the Bureau of Economic Geology, University of Texas, was appointed Oct. 26, 1915, director of the bureau, the former director, Dr. William B. Phillips, having resigned to become president of the Colorado School of Mines.

Robert B. Beahm, who for many years has handled the general sales of Weston Dodson & Co., Bethlehem, Penn., in an efficient and successful manner, will, at his request, be relieved of that position on Jan. 1, 1916. He, however, will remain with the company in an advisory capacity after that date.

W. J. Smith, formerly superintendent of the Welch Coal and Coke Co., Welch, W. Va., has resigned his position and accepted a place on the sales force of the Ironton Engine Co., Ironton, Ohio, and will look after the Norfolk & Western and Virginian Ry. territory, making headquarters at Welch, W. Va.

Charles R. Wessman, formerly sales manager of the Main Jelico Mountain Coal Co., has accepted a position with the Ironton Engine Co., to handle its mining machinery and will be located in Knoxville, Tenn. He will have charge of the territory around Birmingham, Ala., Tennessee and southeastern Kentucky.

Benjamin Davis, prominent in anthracite mining circles, was severely injured recently. Mr. Davis is the chief electrician of the Susquehanna Coal Co. and while laying out a new line in the Hickory Ridge colliery a pole fell on him, from which he sustained a badly crushed leg, in addition to internal injuries.

L. E. Wood was recently elected president of the Crystal Block Coal and Coke Co., of Rawl, W. Va., the Crystal Block Mining Co., of Gates, the Central Pocahontas Coal Co., of Anawalt, and the Tug River Power Co., of Hazard, Ky., and the Crystal Supply Co., of Rawl. Mr. Wood has for years been in the service of the United States Coal and Coke Co., at Gary, but will henceforth make his headquarters at Welch.

Col. Truman H. Aldrich, one the pioneer coal-mining men of the Birmingham district, who has been postmaster of Birmingham, Ala., for the past four years, and whose term as postmaster expires shortly, will, about Jan. 1, return to his former occupation of consulting mining engineer, which profession he followed for many years before being appointed postmaster. The town of Aldrich, Ala., where the Montevallo Mining Co. is operating a seam of coal, was named for Mr. Aldrich.

W. A. Phillips, representing the coal companies in the upper end of Luzerne County, Penn., was named by the court on Dec. 2, as contractor for the working of the road in Pittston and Jenkins Townships. Mr. Phillips had the contract last year and keeps the highways in repair at the expense of the coal companies without the levy of a road tax. He filed bonds, in the sum of $11,500, for keeping in repair 23 mi. of highways in Pittston Township, and $5,000 for taking care of 10 mi. of highways in Jenkins Township.

OBITUARY

John Hastie, aged 69 years, for many years mine foreman at the Katy-did colliery at Avoca, Penn., died recently at his home, 1236 Main St., Avoca.

George P. Cronk, treasurer and general manager of the Pennsy Coal Co., of Franklin, Penn., died recently at his home in Franklin.

William P. Rend, president of the W. P. Rend Coal Co., died recently at Chicago. Mr. Rend was a native of Ireland, coming to the United States at the age of seven years. He was also a veteran of the Civil War. He was heavily interested financially in mines in Ohio and Indiana, the output of which has been estimated at over 1,000,000 tons a year. He also owned 2,000 freight cars used in the coal business.

John N. Hodges, the originator of the steam shovel coal-stripping industry in the Pittsburg, Kan., district, died at the Stillwell Hotel, Pittsburg, Nov. 30. He had been in ill health for six months. Mr. Hodges opened the Franklin-Arma-Edson fields. His early life was spent in railroad-construction work and he built many of the branch lines of the Santa Fé railroad in Kansas, Oklahoma and Texas. He is survived by three sisters and two brothers.

Thomas Pruden, 60 years of age, and a prominent coal operator and business man, died recently at Fountain City, a suburb of Knoxville, Tenn. Death was due to acute indigestion. Born in England, Mr. Pruden came to the United States about 35 years ago. He spent his entire life in and about the coal mines and at the time of his death was President and General Manager of the Pruden Coal and Coke Co., the Black Creek Coal and Coke Co. and the First Creek Coal and Coke Co.

Thomas R. Phillips, of Kingston, Penn., treasurer of the Haddock Coal Mining Co., died on Dec. 1 at Nesbitt West Side Hospital, Kingston, of complications, following an operation for gall stones performed on Nov. 23. He was a native of Wales, but had lived in the Wyoming Valley since childhood. He filled various positions with the Plymouth Coal Co. for 40 years, was one of the receivers of that concern, and of recent years had been treasurer of the Haddock company. He is survived by his widow, two daughters and one son.

INDUSTRIAL NEWS

St. Louis, Mo.—The Peabody Coal Co. has removed to larger and more commodious quarters on the 12th floor of the Syndicate Trust Bldg.

St. Louis, Mo.—The "Burr" mine of the Carterville Coal Co., at a recent public sale brought $37,000. The St. Louis Union Trust Co. was the purchaser.

Philadelphia, Penn.—The Valley Camp Coal Co. has purchased for $250,000 the steel steamer "E. L. Wallace" and will place the boat in the coal-carrying trade.

Lamar, Mo.—The Arcadia Coal and Mining Co. has been organized at Lamar with a capital stock of $40,000. The incorporaters are Logan Rives, Walter Webb and D. B. Houston.

Nashville, Tenn.—The Blizzard Coal Co. has been organized with a capital of $20,000. The incorporators are E. F. and Paul Blizzard, Bert Ingram, C. W. Harman, and V. A. Treat.

Hamilton, Ohio—The Hamilton-Otto Coke Co. is contemplating the construction of a plant for the extraction of light oil as a byproduct of the coke plant, at a cost of about $80,000.

Birmingham, Ala.—The Majestic Coal Co. filed articles of incorporation in this city recently with a capital stock of $40,000. The officers are: H. L. Morrow, president; W. H. Kirkland, vice-president; L. W. Andrews, secretary and treasurer.

Washington, D. C.—A petition of the coal operators in the Wyoming region of Pennsylvania for a rehearing on the new rates to the Atlantic coast on small sizes of anthracite was recently denied by the Interstate Commerce Commission.

Lansford, Penn.—The Lehigh Coal and Navigation Co. is now making anthracite briquettes and marketing them. If the venture proves to be commercially profitable it will go a long way toward the prevention of waste in anthracite production.

Knoxville, Tenn.—The last of the property of the Ideal Block Coal Co., bankrupt, near Lily, Ky., has been sold by the receiver, Mr. E. G. Stooksbury, of Knoxville, Tenn. The affairs of the company will probably be wound up by the first of the year.

St. Louis, Mo.—The Dosenbach Realty Co. of this city has just sold a large tract of land, comprising 3,000 acres, in the coal fields of Birmingham, Ala., to the Majestic Coal Co., represented by the Bush interests, who are large coal and iron operators in that district.

Bluefield, W. Va.—The Flat Rock Coal Co., which had offices in this city and whose mines were near Honaker, has been purchased by Lynchburg interests, who intend to take over and operate the mines on a larger scale. S. T. Lee will be president of the new concern.

Whitesburg, Ky.—The Cumberland Mountain Coal Co., with headquarters at Charleston, W. Va., has purchased from the Mason Coal and Coke Co., an eastern corporation, more than 13,000 acres of rich coal and timber land. The property lies along the route of the proposed extension of the Virginian R.R.

Charleston, W. Va.—The new Rex Coal and Coke Co., with headquarters at Huntington, has been organized with a capital of $100,000. The incorporators are G. F. Wallace, L. R. Reese, J. W. Lawton, C. P. Gibson and F. H. McClung, all of Huntington. Mines will be operated in the vicinity of Ethel, Logan County.

Jefferson City, Mo.—The Iroquois Mining Corporation of Kansas City, has been incorporated with a capital of $50,000. The incorporators are A. L. Stump, E. M. Gordon and R. L. Dennison. The purpose of incorporation is to operate mines of all kinds, build general mining and ore smelting operations and development business.

Duluth, Minn.—November coal receipts at Duluth and Superior amounted to over 1,000,000 tons and brought up the season's total, exclusive of December shipments, to about 9,700,000 tons, which is approximately 200,000 tons greater than the entire season of 1914. December shipments will still further increase this amount of coal.

Lexington, Ky.—The Kenark Union Land Co., with $25,000 capital, has filed articles of incorporation here and will engage in development of coal, gas and timber lands, the charter authorizing the company to engage in railroad and real estate business. The incorporators are: R. W. Kenney, Lexington; J. R. Combs and W. G. Sellers, Hazard.

Huntington, W. Va.—Jairus Collins, of Bramwell, W. Va., heading a syndicate of West Virginia capitalists, has leased a boundary of 15,000 acres of Buffalo Creek coal land in the Perry County, Kentucky field, and will begin immediately the development of the property on a large scale, giving employment to several hundred men from the start.

Philadelphia, Penn.—The steel ship "Bylaly," built for the Pocahontas Coal Co., has been launched from the yards of the builders at Camden. The boat has a capacity of 5,450 tons and a speed of 10½ knots. The boat is similar to the "Norfolk," recently built for the Coastwise Navigation Co. The "Bylaly" will ply in the trade between Norfolk and New England points.

Philadelphia, Penn.—The "Silver Shell" and the "Virginia," two new coal steamers just completed for service in the fleet of the Pocahontas Fuel Co. having been delivered by the builders are now on their initial trips in the coal trade. Another vessel similar to the "Virginia" will be launched shortly from the shipyards in Camden, and after being fitted out will join the above fleet.

Charleston, W. Va.—The Hartland Colliery Co. has been organized with headquarters at Clay and a capitalization of $5,000. The incorporators are John B. Hart and Edward Hart, of Clarksburg; Marcy McD. Price, of New York; David T. Price, of Johnstown, Penn., and W. I. Booth, of Clarksburg. The purpose of the organization is to operate mines in the Henry and Pleasant districts of Clay County.

Wellsburg, W. Va.—It is reported that J. C. McKinley, of the Richland Coal Co., has purchased a considerable acreage of valuable land just north of the Beech Bottom coal tipple. A persistent rumor is to the effect that the property purchased by Mr. McKinley will be used by a large steel corporation in the establishment of a big mill. Mr. McKinley, on the other hand, says that the property will be utilized by the Richland Coal Co.

Toledo, Ohio—It has been announced here that the Chesapeake & Ohio R.R. has practically financed the proposed link between that road and the Hocking Valley. This connection is to extend from Plymouth, north, to the terminals of the Hocking Valley, and south to Columbus. It has been incorporated under the name of the Chesapeake & Ohio Northern Ry. and has sold $1,000,000 first-mortgage, 30-year 5 per cent. bonds. The work of constructing the link complete will cost about $4,500,000.

St. Louis, Mo.—The Rutledge & Taylor Coal Co., with home office in this city, and branches in Chicago, Omaha, St. Paul, Kansas City, Davenport and Fort Dodge, Iowa, is said to be marketing 12,000 tons of coal daily from its three mines: From the Livingston mine, 4,500 tons; Nokomis mine, 4,000 tons, and Security mine, 3,500. Livingston mine is rated as the largest commercial mine in Illinois. Records show that for the year ending June 30, last, 809,291 tons were produced, averaging 4,522 tons per day for each day the mine was in operation.

Knoxville, Tenn.—The property of the New River Coal and Coke Co., comprising about 50,000 acres of coal rights in Anderson, Campbell and Scott counties, Tennessee, on the New River R.R., which was offered for sale a short time ago by Walter Devault, receiver, Knoxville, Tenn., was not sold, and the receiver has had some further prospecting done on the property to better show the coal it contains. The property carries the Red Ash, Dean, Jellico or State, and Blue Gem seams above drainage, and probably the Coal Creek seam below drainage.

Chicago, Ill.—At a meeting held in Chicago, Nov. 29, of members of the Illinois Coal Operators' Association and the Indiana Bituminous Coal Operators' Association, to discuss the present freight-rate situation, it was decided to intervene against the advance in coal rates in Illinois and Indiana on or before Dec. 25. The general sentiment of the operators was to the effect that they would not oppose any horizontal advance which might include other districts, but they felt that increases from Illinois and Indiana, with a probable reduction in the Hocking field rates, would further reduce Indiana and Illinois tonnages to Chicago and Northwestern markets.

La Follette, Tenn.—The property of the La Follette Coal, Iron and Ry. Co., consisting of coal mines, coke ovens, coal washer, iron ore mines, limestone quarry, blast furnace, machine shop, railroad, and coal, iron and limestone lands, together with dwellings, farms and timber lands, at and near La Follette, Tenn., are to be sold on Dec. 18 by the receiver, Neil Robinson, of La Follette. The furnace is at present closed down, being relined. The plants have all been steadily operated by the receiver for about two years, except that Rex No. 2 coal mine was closed down by the receiver shortly after his appointment, and most of the loose equipment removed to the other two coal mines. A steam shovel for loading coke at the coke ovens has been added to the equipment by the receiver.

Bluefield, W. Va.—Five coal companies, including the Pocahontas Domestic Coal Co., the Williamson Coal and Coke Co., the Warrior Coal and Coke Co., and the Yukon Coal Co., are planning the entire electrification of their mines at a total cost of approximately $25,000. The Elkhorn Coal and Coke Co. will install an electric plant at a cost of about $8,000. Another company, one of the largest in the state, operating above Williamson, will install a $60,000 to $75,000 electrical equipment in the spring. It is estimated that contracts for upwards of $150,000 worth of electrical equipment either have been or will be shortly placed in the Norwalk & Western fields. In the Guyan River field the Main Island Creek Coal Co. has advertised for bids on electrical equipment. This concern recently completed the installation of a $14,800 electrical plant. The company is located at Omar.

Coal Trade Reviews

General Review

Anthracite in short supply, but consumers still generally indifferent. Indications of a runaway market in bituminous. Continued advance in ocean freights. Excellent situation at Pittsburgh and the Middle Western trade is speeding up.

Anthracite—The dealer trade has been fairly busy, as a result of the sustained low temperatures, supplemented by the congestion in transportation facilities, but there is still a general absence of the real snap that should characterize the business at this time. Supplies are clearly falling behind consumption, due to the inadequate car supply and the railroad congestion, but consumers have not yet experienced any inconvenience and fail to show an active interest in the situation. The steam grades are easily the leaders in a generally strong market, and buyers are demanding full shipments on their contracts. Persistent rumors of sweeping revisions in the anthracite circulars appear to be substantiated to a certain extent by the fact that no negotiations have so far been conducted on contracts for the new year.

Bituminous—The slow though persistent improvement of the past several weeks has culminated in a distinct hardening of the market all along the line. Conservative interests are definitely anxious over the situation, and it is generally agreed that any further interruption to transportation facilities, such as a tightening of the congestion at New York, would more than likely precipitate a runaway market. The market is difficult to quote, prices fluctuating over a wide range, some unusually high figures being offered for coal on cars at the distributing centers to fill out contracts, though scarcely any such offers are accepted. Supplies at Hampton Roads are more than ample, but the coastwise movement is exasperatingly slow, due to scarcity of vessels and rough weather, and agencies at Down East points are becoming decidedly worried.

Exports—The unprecedented high freights on steam vessels is forcing more schooners into the off-shore trade, and in spite of this it is practically impossible to negotiate a coal charter to Mediterranean ports, except where an occasional vessel appears that is too old to handle grain. Coastwise freights are moving in sympathy with the export business, and are now ruling at prohibitive levels except where shippers are so hopelessly behind on the contracts that they are forced to meet the new figures. The movement over the Hampton Roads piers continues disappointing, with the demand at a minimum, and the accumulation somewhat above normal.

Ohio Valley—The cessation in Lake shipping has served principally to postpone a marked improvement that would otherwise be noticeable at this time. The situation is rather mixed even as it is, there being an unexpectedly heavy demand for slack coal. Conditions are uniformly favorable to a maximum consumption; the steel industry is working at the highest capacity in its history, manufacturing establishments are running well and the general prosperity will stimulate an active domestic consumption. The removal of the embargo on certain railroads has created a better feeling, but the increased consumption due to the lower temperatures is still throwing an excess load on the carriers. Many of the important steam contracts expiring Jan. 1 are absorbing the attention of the sales agencies.

Middle West—The freezing temperatures have speeeded up the Middle Western trade in an impressive manner, while prices have responded to the improved conditions, and the market is thoroughly in control of the operators. Farsighted consumers are beginning to anticipate a period of high prices and are instituting energetic measures to insure their supply; some large public service corporations are putting out inquiries covering their requirements two and three years ahead. Final receipts at the upper Lake ports have been heavy, while the cold weather has precipitated such a flood of rush orders from consumers that the dock companies have been forced to full-time operations in loading out coal.

A Year Ago—Anthracite under pressure and working schedules heavily curtailed. Bituminous continues flat with prices weak and irregular. Slack the best feature. Reactionary effect of the mild weather.

BUSINESS OPINIONS

Iron Age—Transactions in Lake Superior iron ore are on the verge of closing which it is believed will establish a price of $4.25 for Mesaba Bessemer and $3.55 for Mesaba non-Bessemer ore, an advance of 80c. for the former and 70c. for the latter upon the prices of this year. Old-range ores, according to present indications, will sell at an advance of about 75c. over the 1915 schedule instead of $1, as favored by some producers. As demand is expected for all the ore that can be got down in 1916 it is not improbable that sales later in the season will represent an advance over opening prices. The difficulty of forcing pig-iron production above the present rate appears in the statistics for November. At 3,037,308 tons for last month, the output was 101,244 tons a day, against 3,125,491 in October or 100,822 tons a day.

Boston News Bureau—Attention is focussed on the President's message. This needs study before the best criticism is possible. Wall Street seemed to accept the message fairly well. Probably no message was ever read the world over as this one will be. The more one studies business conditions the more one is impressed with the improvement under way. All through the West sentiment is most optimistic. Then again, the most gratifying reports are those coming from the South. When we recall the situation in the South a year ago, the contrast is most striking. It is generally believed that 1916 will be a most prosperous year for business men in all lines.

Dun—Nearly every development is of a constructive nature, and further gains are added to those previously recorded. Each week domestic consumption enlarges, while the railroad embargoes emphasize the magnitude of the export business. There is now scarcely an industry or trade in any section that is not participating freely in the general advance. In striking contrast to the tendency in the same period of 1914, commercial failures in the United States during November were slightly less numerous than in the previous month, while the aggregate liabilities made the best exhibit of the year. Total insolvencies, numbered 1,565 and supplied an indebtedness of $15,694,434, as against 1,599 in October for $25,522,380 and 1,815 in 1914, when the amount involved was $25,489,498.

Bradstreet—Apparently, the week has been the busiest in a long time. Activity in trade as well as in leading industries is unabated—is more marked, in fact, than heretofore. Jobbers, wholesale dealers, retailers, manufacturers and bankers are a unit in reporting activity, and sold-up-for-months-to-come is the condition of numerous industries. Complaints spring from inability to get supplies and from chagrin at not having bought at lower price levels than now prevail, rather than from lack of demand.

Dry Goods Economist—Retailers are evidently beginning to realize the difficulties surrounding the supply of certain lines of merchandise. Buyers who have hitherto shown decided conservatism in providing for even their near-by wants are now urging manufacturers to accept orders for delivery at quite distant dates. The growing indications of prosperity, the high prices of raw materials, the shortage in dyestuffs, and the increased consumption of domestic products through the curtailment of imports are the compelling factors.

Marshall Field & Co.—Current wholesale distribution of dry goods shows a handsome increase over the corresponding period of a year ago. Improved retail demand and low stocks brought merchants to market in large numbers. Road orders for both immediate and future delivery are in considerable advance of previous years. Collections are about normal. Prices are firm.

The Southern Lumberman—Though few December price lists are as yet available, such lists as have been mailed out show further advances in yellow pine prices, and current sales are reported as being made at prices which, on a number of items show material advance over values realized on sales during the first two weeks of November. The volume of business, in hard wood which has steadily increased for the past three months, is now moving with such force as to cause optimism and renewed activity on all sides.

ATLANTIC SEABOARD

BOSTON

Ample coal at Hampton Roads but scarcity of boats to bring it forward. A real "flurry" apparently on the way. Georges Creek and Pennsylvania grades in difficulties over car shortage. Water freights advancing to high figures. Anthracite shippers getting far behind on deliveries.

Bituminous—Receipts of Pocahontas and New River are still light, and bottoms are extremely hard to get. Most of the distributors are anxious over shipments and are doing their best to piece out until cargoes arrive. Rough weather at sea is still the rule, barges moving with exasperating slowness. Meanwhile, there is ample coal standing at Hampton Roads where prices are as yet unaffected by the demand at this end; $2.85 is still quoted f.o.b., high-water freights putting a quietus on spot purchases in any volume. It is a little soon for premiums on coal f.o.b. on top of say $1.50 premium on freight alone. Several buyers already covered by contract on their normal supply have been trying to get extra shipments but the scarcity of transportation is so pronounced that such efforts are next to useless.

Undoubtedly on-car prices for delivery inland would be much higher than they are if there were any coal available. As high as $4.25 has been offered on cars Providence, but no sales reported.

The recent turn in the situation has also given pause to the scramble for 1916-1917 contracts. Most of the options at low figures are now understood to be withdrawn, although something like a million tons was closed while the campaign was on, for delivery from Boston alone. A lot of alongside business has also been closed during the same period.

Shippers of Georges Creek along with other factors served by the same railroads are having difficulties over car supply. Rail movement is bound to be slow for weeks if not months to come, and there will be general surprise if the car situation is not much worse before it is better; $2 is now quoted for Georges Creek as compared with the usual season basis of $1.67 f.o.b. mines. Coastwise movement is also very slow and it is only because they have fewer obligations that these shippers have less to worry about than the agencies that look to Hampton Roads.

The Pennsylvania grades are quoted higher than a week ago; $1.75 is being paid for good coals from the Clearfield region, but comparatively small tonnages are to be had. A good deal of coal is offered "subject to prior sale," and usually that means that ten or dozen brokers may be working on the same lot. Some of the railroads are following the market very closely but no actual transactions can be reported. Meantime operators who sold coal in round figures in order to keep the mines going through the dull season have all they can do to make hand-to-mouth deliveries on their most urgent requisitions.

Water Freights are soaring; $2 has already been paid, Hampton Roads to Providence, almost no carriers of any kind being available for anything like prompt loading. Practically the only parties who will pay these rates are shippers who are hopelessly behind on their contract obligations, or consumers themselves who have coal due them and insist on chartering for the contractor's account. Freights to Providence are 75@80c., with as high as $1 reported.

Anthracite—The companies are getting farther and farther in arrears on their orders. Promises are no longer made as to time of delivery. Stove coal is getting in short supply at New York, and dealers here are obliged to take egg and chestnut to get cargoes loaded. Barges move slowly and the demand far exceeds the supply.

Bituminous quotations, f.o.b. loading port at points designated, are about as follows per gross ton:

	Philadelphia	New York	Baltimore	F.o.b. Mine
Clearfields	$2.80@3.05	$3.10@3.35	....	$1.55@1.80
Cambrias and Somersets	3.00@3.25	3.30@3.50	....	1.75@2.00
Georges Creek	2.92@3.25	3.22@3.55	$2.85@3.18	1.67@2.00

Pocahontas and New River prices, on cars Boston, are $4@4.30; Providence, $4.15@4.25; and f.o.b. loading ports at Hampton Roads, $2.85.

NEW YORK

Anthracite consumption increasing. Retailers are busy and urging quicker deliveries. Steam coals scarce and commanding full prices; $2 coal the rule. Water freights higher.

Anthracite—The hard-coal market is more than holding its own. Consumption has increased considerably and supplies are correspondingly less. While no serious complication has as yet developed, retail dealers state that continued cold weather will soon necessitate quick deliveries as their supplies are getting low. On the other hand, shippers are seriously handicapped by the severe and continued congestion on the railroads.

Serious car shortages continue and many of the mines are idle much of the time. Egg coal remains the longest in supply and some stray cargoes have been picked up at 10c. below full circular. Stove is in good demand and fewer straight orders for this size are filled; buyers being urged to take a mixed cargo. Chestnut is the strongest. The steam sizes are tight. Pea is bringing full prices all around. Buckwheat No. 1 is well cleaned up; the cheaper grades are bringing $2.45 while the choice grades are scarce, and held at slight premiums. Rice and barley are also scarce.

Quotations, f.o.b., gross tons, at Tidewater follow:

	Lower Ports		Upper Ports	
	Circular	Individual	Circular	Individual
Broken	$5.05		$5.10	
Egg	5.30	$5.20@5.30	5.35	$5.25@5.35
Stove	5.30	5.30@5.30	5.35	5.35@5.35
Chestnut	5.55	5.55@5.55	5.60	5.55@5.60
Pea	3.50	3.45@3.50	3.55	3.50@3.55
Buckwheat	2.75	2.45@2.75	2.80	2.45@2.80
Rice	2.25	1.95@2.25	2.30	2.00@2.30
Barley	1.75	1.50@1.75	1.80	1.75@1.80

Bituminous—Heavy demand and high prices are the dominating features of the soft-coal market. The prediction that the market would see $2 coal at the mines has been realized and even higher figures are noted. Quotations of $4 f.o.b. Tidewater would not be surprising soon. There is not an over-abundance of coal on hand and railroads are unable to get shipments foward. There are also some labor troubles in the Clearfield region which threaten to spread.

Many shippers are complaining of coal lost somewhere between the mines and Tidewater and are urging the railroads to rush it forward, while boats are held at the docks waiting for the coal. Car supply remains on about a 60 per cent. basis. Very little coal can be had for less than $2 at the mines and indications point to a 25c. increase within a few days. Line quotations are on a similar basis. No f.o.b. quotations at less than $3.20 are heard even for the cheaper grades. Slack is held at from $1.15 to $1.25.

Quotations, gross tons, f.o.b. Tidewater, for various grades follow:

	South Amboy	Port Reading	St. George	Mine Price
Georges Creek Big Vein	$3.80@3.90	$3.80@3.90	$3.80@3.90	$2.25@2.35
Georges Creek Tyson	3.30@3.50	3.30@3.50	3.30@3.50	1.75@2.00
Clearfield:				
Medium	3.30@3.40	3.30@3.40	....	1.75@1.85
Ordinary	3.30@3.40	3.30@3.40	....	1.75@1.85
Broad Top Mountain				1.25@1.45
Cambria County:				
South Forks	3.30@3.55	....	....	1.75@2.00
Nanty Glo	3.30@3.55	....	....	1.75@2.00
Barnesboro	3.25@3.35	....	....	1.75@1.85
Somerset County:				
Quemahoning	.....	3.30@3.50	3.30@3.50	1.75@2.00
Medium	3.25@3.35	3.25@3.35	3.25@3.35	1.75@1.85
Latrobe	3.20@3.30	....	....	1.65@1.75
Greensburg	3.30@3.50	....	....	1.65@1.85
Westmoreland	3.20@3.30	.....	....	1.45@1.55
West Virginia Fairmont ¾		3.05@3.15	3.05@3.15	1.25@1.35
Fairmont mine-run		3.00@3.15	3.05@3.15	1.25@1.35
Steam		3.20@3.30	3.20@3.30	1.65@1.75
Western Maryland		3.20@3.30	3.20@3.30	1.65@1.75

PHILADELPHIA

Pea shipments falling behind demand. Consumers doing little stocking. Inadequate car supply and delayed movement serious. Bituminous market nervous. Prices continue upward, with $2 coal in sight. Exports still quiet.

Anthracite—Another week has passed without the expected snap to the trade developing despite a two-in. snowfall in the suburbs. The dealers were fairly busy, but each day's orders were usually cared for promptly. Late buyers have so far not been inconvenienced and show little interest in the market. This has a depressing effect on the dealer, who is also showing a tendency to avoid preparing for an emergency that is all the time becoming more obvious among the operating interests. If there is any unusual rush it is a question if it can be handled properly. The inadequate car supply has caused many collieries to close down for several days at a time; one of the largest companies had 15 collieries shut down in one day from this cause. Deliveries have also been very unsatisfactory and in many instances coal has been in transit ten days or two weeks between the scales and destination.

Broken coal is still in active demand and the companies are not anxious to take orders for any quantity of this size. A ready market at $3.50 and tax awaits all the coal that is not contracted for at $3.25 and tax. Egg coal shows very little improvement and while of course the companies are adhering to their price of $3.75 and tax, there have been recent sales by individuals at 25c. per ton less. Stove remains popular and if there is any price cutting it is only on inferior grades and not worth mentioning, for even fair coal brings the full circular of $4 and tax. Chestnut has had a varied career, but now all good grades are being sold at $4.15 and tax and one or two shippers with high-grade coal report a shortage.

Pea coal is the real leader and dealers protected at $2 and tax are calling for heavy shipments. None of the large companies have sold $2 pea coal in the open market since Nov. 1, but they have sold considerable at $2.25 and tax. Most of the individuals are insisting on $2.25 and tax and not soliciting business at that figure; they are actually moving considerable tonnage at $2.50.

The companies who usually contract at this time of year, about 90 per cent. of the total, have not as yet taken any steps in that direction. The feeling is becoming general that the delay is due to an impending revision of the prices. Collections continue good, but the retailers apparently do not intend to cease their price cutting. Good shipments continue via Port Richmond for tide points.

Prices per gross ton, f.o.b. mines for line shipment and f.o.b. Port Richmond for tide, are as follows:

	Line	Tide		Line	Tide
Broken	$3.50	$4.75	Pea	$2.50	$3.25
Egg	3.75	5.00	Buckwheat	1.50	2.25
Stove	4.00	5.00	Rice	.85	1.75
Chestnut	4.15	5.25	Barley	.50	1.50

Bituminous—A nervous tenseness pervades the market. Plenty of business is offering, but there is not near enough coal to supply the demand. The car supply continues to grow less, and the railroads are slow in making deliveries. Prices continue their upward movement, as has been the case for several weeks. The export business is quiet, with a good demand for charters and few boats available, although the week showed a little spurt in the number of charters arranged for. The prices per gross ton are as follows:

Georges Creek Big Vein	$1.95@2.10	Fairmont gas, ¾	$1.45@1.50
South Fork Miller Vein	1.75@1.85	Fairmont gas, mine-run	1.30@1.40
Clearfield (ordinary)	1.65@1.70	Fairmont gas, slack	1.10@1.20
Somerset (ordinary)	1.65@1.70	Fairmont lump, ordinary	1.20@1.30
West Va. Freeport	1.50@1.60	Fairmont mine-run	1.10@1.15
		Fairmont slack	1.10@1.20

BALTIMORE

Market dominated by car supply and price list uncertain. Hard-coal surplus here gradually being wiped out. Export movement very poor.

For the most part the operating interests are concentrating their efforts to keep up with their existing contracts rather than covering any new fields. Prices herewith, in gross tons at the mines, are based largely upon coal sold between mines and shippers and mines to take care of urgent contracts:

	Mines	Balt.*	Fairmont	Mines	Balt.*
Geo. Crk. Big Vein	$2.00	$3.18	Ordinary mine run	$1.30	$2.73
Geo. Crk. Tyson	1.60	2.78	Ordinary ¾	1.40	2.83
Clearfield	1.45	2.63	Ordinary slack	1.05	2.48
South Fork	1.60	2.78	Low sulphur mine-run	1.50	2.93
Latrobe	1.45	2.68	Low sulphur ¾	1.60	3.03
Somerset (best)	1.50	2.53	Low sulphur slack	1.10	2.53
Somerset (good)	1.35	2.43			
Quemahoning	1.60	2.78			
Freeport	1.35	2.53			
Miller Vein	1.50	2.63			

* F. o. b., outside Capes.

The export movement from this port continues very poor due to the shortage of bottoms. The past week saw a movement of only 11,588 tons on foreign account.

Temperatures around the freezing mark most of the time are causing anthracite consumers to seek coal in larger quantities. The result is that stocks are dwindling; smaller grades are exceptionally scarce in some quarters.

HAMPTON ROADS

November dumpings better than expected. Demand light. Foreign trade irregular. New trade channels opening up.

The movement from Tidewater during the week has not been as heavy as was anticipated. The export movement has been well divided with Italy receiving perhaps the largest amount going to any one country. A number of battleships have been supplied with bunker coal during the week and the government has also taken coal cargoes by colliers.

The demand for both spot and contract business has been light and prices are unchanged on Pocahontas and New River but for high volatile there seems to be some improvement in the demand and some little advance in price. The accumulation of coal at Tidewater is somewhat in excess of normal on the smokeless grades but there is practically no high volatile on hand which has not been contracted for. High rates for steam vessel tonnage is still forcing schooners into the foreign trade, five having taken export cargoes during the week; these cargoes were for two ports in Bermuda, Santo Domingo, Montevideo and San Juan, P. R.

While the total dumpings at Hampton Roads ports for November were not a record as compared with other months of 1915, at the same time they were larger than any November of previous years, and were heavier than expected. The total movement amounted to 1,079,004 tons of which quantity the Norfolk & Western dumped 520,971 tons, the Chesapeake & Ohio 338,364 tons and the Virginian 219,669 tons.

Railroad Tonnages—Dumpings over the local piers for the past five weeks compare as follows:

	Week Ending				
Railroad	Nov. 6	Nov. 13	Nov. 20	Nov. 27	Dec. 4
Norfolk & Western	120,590	133,329	100,598	118,065	116,450
Chesapeake & Ohio	78,210	70,282	67,209	93,924	81,875
Virginian	46,952	72,888	39,485	54,591	41,386
Totals	245,752	276,499	207,292	266,580	239,711

Ocean Charters, Clearances and Freights

OCEAN CHARTERS

The following charters have been reported from various sources during the past week:

PHILADELPHIA

Vessel	To	Tons	Rate
H. Lippitt	Point-a-Pitre	790	$4.12½

OCEAN FREIGHTS

The tonnage scarcity is growing more acute, which has a tendency to advance freight rates to new high levels. Mediterranean rates are unchanged, although occasionally there is a steamer, too old for grain, that is willing to accept coal at less than the equivalent rate on grain. There is an urgent demand for steamers for River Plate ports, and tonnage is difficult to obtain even at advanced figures. Sugar rates from Cuba have advanced to unprecedented figures, and owners of the few boats available for the West Indian trade prefer to send them in ballast unless they can secure very high rates on coal outward. We would quote freight rates on coal by steamer as follows:

To	Rate	To	Rate
Havana	$2.75@3.25	Bermuda	$3.50@ 4.00
Cardenas or Sagua	3.50@4.00	Vera Cruz	5.50@ 6 50
Cienfuegos	3 75@4.00	Tampico	5.50@ 6 50
Port au Spain, Trinidad	4.75@5.00	Rio	**12.00**
St. Lucia	4.75@5.00	Santos*	12 00@12 84
St. Thomas	4.25@4.75	Montevideo	12.00@13.20
Barbados	4.75@5.00	Buenos Aires or La Plata†	12.00@13.20
Kingston	4.00@4.25	Rosario	13.20@16.20
Curacao	**4.50**	West Coast of Italy	21.60
Santiago	4.00@4.25	Barcelona**	19.20@21.60
Guantanamo	4.00@4.25	Valparaiso or Callao	11.00@13.00
Demerara	6.50@7.00	Marseilles	20.40@21.60

* Consignees paying dockage dues. ** Spanish dues for account. † Quotations on Plate coal by British steamers; neutral steamers are more difficult to obtain and the rates are always higher.

W. W. Battie & Co.'s Coal Trade Freight Report.

Note—Figures in **bold face** type are only approximate.

OHIO VALLEY

PITTSBURGH

Conditions in market unchanged, end of lake season postponing improvement due to better consumption. Slack firmer. Heavier consumption in the steel industry.

The local coal trade has not received any material backset through the termination of the Lake shipping season; rather the influence of the shutting off of this outlet has chiefly served to delay any improvement in conditions that otherwise would have become observable. The feeling in the coal trade is distinctly that there will be heavy demand in the next few months, up to Apr. 1 as many consumers are expected to stock coal, and the regular consumption is certain to be large, probably higher than in any previous winter.

The iron and steel industry continues to run under the highest possible pressure, with no possibility of a decrease for many months, and as capacity has been increased somewhat since the last period of activity the current consumption of coal is above the previous record. Manufacturing establishments generally are running well, and operations are increasing. Domestic demand is fair and with the people generally prosperous, domestic consumption of coal will undoubtedly be heavier by a considerable percentage than last winter.

The Pittsburgh district even up to date has felt scarcely any influence from the war demand; even with the shutting off of Lake shipments local operators do not seem to be in position to name the prices necessary to take export business. Car supplies are unsatisfactory but while there is much complaint there is no very serious inconvenience. As empties come back from the Lakes the situation will doubtless be relieved.

Slack is still firmer. We quote free coal as follows: Slack, 95c.@$1; nut, $1.15; mine-run, $1.15@1.20; ¾-in., $1.25@1.35; 1¼-in., $1.35@1.45; on contract to Apr. 1: Slack, $1@1.05; nut, $1.25; mine-run, $1.25@1.35; ¾-in., $1.35@1.40; 1¼-in., $1.45@1.55, per net ton at mine, Pittsburgh district.

BUFFALO

Great activity in slack. All bituminous shippers short of coal. Prices erratic and difficult to quote. Anthracite improving slowly.

Bituminous—The chief feature of the market is the sudden scarcity of Allegheny Valley slack, which is so nearly out of the market that some shippers have withdrawn all quotations. The closing of the Lakes usually throws a surplus of slack on the market and weakens the price but consumers are apparently taking more coal than formerly and are getting anxious over the future supply.

It is reported that the trade in central New York and eastward is taking a large amount of mine-run, while Pittsburgh and Clearfield are staying out of this market on account of their heavy shipments to Tidewater. Even Canada is bidding up on slack and last week paid as high as $1.35 for Allegheny slack on a $1.10-rate.

Only approximate quotations are possible as follows:

	Pittsburgh	Allegheny Valley	Penn Smokeless
Lump	$2.80	$2.50	$2.55
Three-quarter	2.65	2.30	.....
Mine run	2.55	2.20	2.30
Slack	2.15	2.10	2.30

Quotations are f.o.b. cars at Buffalo or the Niagara bridges and per short ton except east of Rochester or Kingston, Ont.

It is a long time since the bituminous market was in such an unquotable shape. Shippers will not consider contracts and are hardly willing to take single orders except where they have their own mines.

Anthracite—The trade improves steadily, but is not as active as it should be at this time of the year. Chestnut is selling well, but is much less active than usual. Egg is moving slow and it is difficult to get rid of it as fast as it accumulates. Independent anthracite is about normal; full circular prices are obtained, but seldom any premium.

Prices, f.o.b. Buffalo per long ton are $5.60 for grate, $5.85 for egg and stove, $6.10 for chestnut, $4.30 for pea, $3.25 for buckwheat, $2.75 for rice, $2.50 for barley and $2.50 for screenings, with 25c. a ton additional for delivering on board Lake vessels.

Lake shipments for the week dropped to 79,076 tons, but the decline was mostly on account of the storms and the scarcity of tonnage, vessels now going out light for grain, if at all. Shipments for November were 443,900 net tons and for the season, 3,757,146 tons, as against 4,292,510 tons to December last season.

TORONTO, CAN.

Revival in industrial enterprises stimulates the coal business. Car shortage expected to improve shortly.

Trade has been active in all lines and with the marked revival of manufacturing activity dealers are looking forward to a busy season. There is some diminution of supplies on hand owing to delayed deliveries due to car shortage, but dealers expect that this difficulty will very shortly be lessened by the closing of navigation diverting railway traffic from the Lake ports to other routes.

Soft coal screenings are still somewhat scarce. Prices are generally well maintained and are as follows, per short ton, for best grades: Retail, anthracite egg, stove and nut, $7.75; grate, $7.50; pea, $6.50. Bituminous, retail, steam, $5.25; screenings, $4.25 to $4.50; domestic lump, $6; cannel, $8. Wholesale, f.o.b. cars at destination, three-quarter lump, $3.79; screenings, $3.15.

COLUMBUS

Increased demand for domestic sizes. Steam business is still good and the circular well maintained. Large number contracts expire Jan. 1.

Colder weather has stimulated the domestic market. Buying of Hocking grades for immediate shipment was the feature of the week. Retailers' stocks were light and a rush of small business made it necessary for them to replenish their stocks. Because of the car shortage in West Virginia, Ohio operators received a larger share of the business then formerly; production in some West Virginia fields is reported far below normal. Retail prices remain firm.

Small sizes are very strong, and there was some inconvenience due to the shortage of nut, pea and slack and coarse slack. Prices are nearing the $1 mark. Railroads are still storing fuel but the larger part of the movement is over. Many steam contracts expire at the first of the year. Sales managers are concentrating their attention on renewals. Indications are that prices on this business will be slightly higher than a year ago.

Anthracite is selling well in central Ohio territory. Prices are firm at former levels.

Prices in Ohio fields f.o.b. mines, per short ton, are as follows:

	Hocking	Pomeroy	Eastern Ohio	Kanawha
Re-screened lump	$1.60	$1.65	.....	.....
Inch and a quarter	1.50	1.50	$1.35	$1.50
Three-quarter-inch	1.35	1.40	.....	1.35
Nut	1.25	1.30	.....	1.25
Mine-run	1.15	1.20	1.05	1.10
Nut, pea and slack	.85	.90	.80	.75
Coarse slack	.75	.80	.70	.65

Mines have been working at about the following percentages of full capacity:

District	Week Ended				District	Week Ended			
	Nov. 13	Nov. 20	Nov. 27	Dec. 4		Nov. 13	Nov. 20	Nov. 27	Dec. 4
Hocking	50	60	50	60	Cambridge	70	75	70	75
Jackson	40	45	40	50	Massillon	70	75	60	70
Pomeroy	85	85	80	85	Eastern O.	75	80	75	80
Crooksville	65	65	60	70	Average	65	69	62	70

TOLEDO

Manufacturers supplies light. Slack coal fluctuating badly. Cars short, but no congestion as yet.

The steam trade is strong and prices are holding very close to the list, for the most part, while slack coal can scarcely be quoted. Last Saturday, quotation on West Virginia slack was around 85c.; Hocking from 85@90c., and Kentucky slack around 90c. with Pittsburgh No. 8 from 85@90c. Pocahontas egg is strong but lump is a trifle weak due to the excessive demand for egg and slack.

The Lake movement is commencing to slow down and is now confined mostly to cleaning up stocks. There is a marked car shortage but as yet there is no congestion at Toledo. Local dealers are fairly well stocked and manufacturing plants have fair supplies.

Prices f.o.b., mine, per short ton are as follows:

	Pocahontas	West Virginia	Hocking	Pomeroy	Jackson	Kentucky	Pitts. No. 8
Lump	$2.25	$1.60@1.85	$1.60	$1.75	$2.50	$2.00	$1.35
Egg	2.25	1.00@1.25			2.50	1.80	1.20
Mine-run	1.40	.85@1.00	1.10	1.10		.90@1.00	1.10
Nut	1.75	1.00@1.15	1.25	1.85		1.10@1.25	

CLEVELAND

Closing of the Lake season has thrown a large tonnage of coarse coal on the market. Slack coal in short supply.

The Lake business has practically closed for 1915 with but a few cargoes yet to go. Shippers who had coal left over had to turn it on the local markets, and as Lake coal is almost entirely ¾-in. screened, it has a comparatively small outlet. The price did not suffer, but sales hardly made an impression and reconsignments from other lake ports materially overstocked the market.

The high prices being paid in the East have prevented any Pennsylvania fine coal coming into this market and quotations on Youghiogheny are nominal as local brokers are not in the market at the prices quoted. Receipts of fine coal were very light over Sunday with prices considerably stronger. The activity in fine coal is due to the fact jobbers and operators have only enough for their contract trade to run the plants three or four days, which is too narrow for a safe working basis.

The retail trade has been good. The weather has not been extremely cold for this time of the year, but it has been necessary to keep up good fires.

Jobbers are paying the following prices f.o.b. Cleveland per short ton:

	Pocahontas	Youghiogheny	Bergholz	Wainwright	No. 8
Freight	$1.45	$1.00	$0.70	$0.70	$0.90
Lump	3.35@3.40	.....	.....	....	.....
Lump, 6 in	....	.....	2.30	....	.....
Lump, 1¼ in	....	2.40	2.10	2.30	2.05
Lump, ¾ in	....	2.30	2.00	2.10	1.90
Lump, 3 in	....	.....	.....	2.40	.....
Egg	3.35@3.40	.....	.....	....	.....
Mine run	2.70	2.15	1.90	1.95	1.80
Slack	....	2.00	1.85	1.80	1.80

DETROIT

Steam coal buying continues steady. Inquiry for domestic coal and anthracite improves. Railroad embargo removed.

Bituminous—Buying of steam coal continues with gratifying regularity. Small sizes are the most popular and shippers and jobbers are finding the problem of supply creates perplexities. Domestic coal is moving more freely, and the weather iis sufficiently frosty to give strength to the market. Shippers are beginning to participate in the improvement. Car shortage and unusually pressing demands for railroad equipment to move other commodities is slowing down deliveries. The embargo declared by the Grand Trunk railroad, Nov. 16 was removed; Dec 4. Prices on slack and mine-run range between 75 and 90c. a ton. Three-quarter West Virginia lump is $1@1.10, Jackson Hill domestic lump $2.50, Hocking domestic lump $1.50 and smokeless egg and lump holds at $2.25.

Anthracite—In the anthracite trade, low temperatures have increased business for retailers, but has benefitted shippers only to a minor degree. Car shortage and the restrictions on the Grand Trunk tend to curtail and delay deliveries. Lake shippers are paying a premium of about 15c. a ton over the season rate of 30c. on shipments to Lake Superior ports.

CINCINNATI

Colder weather and continued car shortage has strengthened the market materially. Prices firm and tending toward higher levels.

The coldest weather of the season has steadied up the retail market, in an impressive manner. The inquiries increased materially, and although the actual movevent was not large, the situation has undoubtedly improved. There is still much coal in the hands of retail dealers, but the end of these supplies is in sight. Industrial consumption is also better than at any time this year, as the larger consumers are finding it necessary to use the maximum amount of coal.

Demand is excellent everywhere and the car shortage is the most serious problem at the present time. There is little prospect of immediate improvement in this respect, although the railroads and coal interests are exerting every effort to accelerate the movement.

LOUISVILLE

Demand stiffening due to lower temperatures and improved industrial situation.

The advancing winter is making the demand for domestic coals better and the steam sizes are also stiffening. Mines are operating on a full schedule, while through the eastern section coking plants are resuming. The fact that Pittsburgh is shipping little or no domestic coal into this market has been a good influence on the local business. Eastern Kentucky block coals are bringing, f.o.b. mines, long ton basis, from $1.65 up to $2.25, the latter being for fancy coals, while nut and slack ranges from about 50 to 80c. in a few cases.

COKE

CONNELLSVILLE

Coke market colorless, with no change in prices and no definite outlook. Production and shipments practically unchanged.

The coke market continues to drag. There is very little demand for prompt furnace coke and scarcely any inquiry against contracts for the new year. Shipments on current contracts seem to be adequate for the requirements of the furnaces. The coke trade has no definite theory as to the course of prices in the next few months. The sharp advances in pig-iron prices that are occurring almost daily give the market a favorable aspect from one viewpoint, but another viewpoint is that pig-iron prices are advancing not so much on account of heavily increased demand as because production cannot be further increased, there being scarcely any idle furnaces, and if there are no idle furnaces to blow in there can hardly be an increased consumption of coke, and increased consumption apparently is needed to advance prices.

Present quotations for prompt coke are about on a level with contract prices already made for next year, so that the outlook is not for any material change. A flurry over the holidays is of course always expected. We quote: Prompt furnace, $2.15@2.25; contract furnace, first half, $2.35@2.50; year 1916, $2.25@2.35; prompt and contract foundry, $2.90@3.25, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Nov. 27 at 432,341 tons, a decrease of 1,061 tons, and shipments at 435,084 tons, an increase of 4,327 tons.

Buffalo—The market is not quite so strong locally, though oven quotations are still on the basis of $5 for best 72-hr. Connellsville foundry, with no actual stock coke to be had, some 48-hr. being sold instead at $4.20. Some ovens are quoting as high as $5.20 for foundry. Consumption increases, but the output sometimes exceeds the demand.

Chicago—In the face of rising prices the demand remains undiminished. Eastern tonnage now being sent into this market is much greater than at any previous time. Spot coke is bringing a premium of at least 50c. per ton. Some long-term contracts are being negotiated. Byproduct domestic sizes are easier. Prices per net ton, f.o.b. cars Chicago, are as follows: Byproduct, foundry, $5.25@5.75; byproduct, domestic, $4.75@5; Connellsville, $5.25@5.75; Wise County, $5.25@5.50; gas coke, $4@4.25.

MIDDLE WESTERN

GENERAL REVIEW

Domestic consumption improved. Fine coals in brisk demand. Activity of steam grades noticeable. Smokeless products and anthracite weak.

Activity has characterized all branches of trade during the past week. Freezing temperatures have ruled over the Western country, and the absorption of domestic sizes has gained momentum. Prices are responding to the improved conditions, and sales of Western coals are generally close to the circular. West Virginia smokeless grades and anthracite are about the only weak features of an otherwise strong market. Steam and domestic sizes are in about equal demand.

Belated orders from country dealers are reaching many wholesalers and another week of all-around activity will bring about concerted action on the matter of advancing prices. Certain large consumers foresee an era of higher prices for steam coal, and are taking measures to cover their requirements. Storage by Western railroads has not yet reached the proportions expected, and it is reported that several carriers who have not yet taken any action on this matter are negotiating for large quantities to be put in storage at a convenient season. Some public utility corporations are seeking to make contracts for steam coals over periods of two and three years' time.

CHICAGO

Fair tonnage moving. Smokeless market congested. Indiana and Illinois coals arriving in moderate volume.

Franklin and Williamson County domestic lump shipments have increased to the country dealers; egg and nut are slow but steam lump is steady, and screenings are active. Harrisburg and Saline County domestic lump shipments are rather slow; steam lump orders have not been fully satisfied, while screenings are short and selling at a premium. Some Southern Illinois spot domestic lump and egg has been sold at $1.50 during this week, but this surplus is now all cleaned up.

Springfield domestic lump shipments are better, due to the fact that two large producers are out of the market at the present time. Considerable coal is moving from this district for raiload storage. Sceenings are brisk.

There is considerable activity in Fourth Vein coal of all sizes; Third and Fifth Vein steam lump shipments are steady, with demand for domestic lump increasing. Sullivan County Sixth Vein domestic shipments are larger, but egg and nut from this district are still torpid. Greene County lump is quiet. All Indiana free screenings are absorbed at maximum prices.

The West Virginia smokeless market is somewhat demoralized owing to the arrival of a considerable tonnage of lump and egg intended for shipment by the Lakes. Mine-run has been sympathetically affected by this situation. Considerable lump and egg has sold as low as $1.40, and mine-run dropped to $1.15 in some cases. Pennsylvania mine-run shipments are limited, while slight recessions are noted in the demand for lump and egg, nut being active.

The market for Hocking coal, which has been soft for several weeks, is much improved. Lump in limited quantities is sold at the full circular price of $1.60.

Over 100 cars of anthracite accruing demurrage were sold this week at some concession in price in order to get the coal off the market.

Quotations in the Chicago market are as follows, per net ton f.o.b. mines:

	Williamson and Franklin Co.	Springfield	Sullivan	Clinton	Knox and Greene Cos.
Lump	$1.60@1.75	$1.60@1.75	$1.60@1.75	$1.60@1.75	$1.40@1.60

Screenings	.70@.75	.75		....	.60@.70

Kanawha splint lump, $1.50@1.90.

ST. LOUIS

Demand improving. Screenings in short supply. Domestic trade waiting colder weather.

There is a gradual improvement in the industrial demand. There are not enough screenings to supply the requirements and the price was forced up at the end of the week to 55@60c. for Standard and Staunton and 65@70c. for Franklin and Williamson County. There has not been sufficient change in the weather to quicken the domestic demand.

Quotations f.o.b. mines during the past week have ranged on the following basis per short ton:

	Frnk. Co.	Wlmson. Co.	Staunton	Standard
6-in. lump	$1.50@1.65	$1.50@1.65	$1.25	$1.00@1.15

Freight Rates—Inner group, St. Louis, 57½c., East St. Louis, 37½c.; outer group, St. Louis, 72½c.; East St. Louis, 52½c.

DULUTH

Cold weather stimulates buying. Good movement of all grades. Prices firm.

There was a steady demand for all the grades of bituminous coal during the past week. The weather was moderately cold and the retailers and householders bought heavily. A large number of orders were received by the various dock companies, which have been working full time to satisfy the demands of the trade. Receipts have been quite heavy recently, the companies putting forth every effort to get as much coal forward as possible before the close of navigation, which is likely to occur at any time. Prices remain firm. Quotations per short ton f.o.b. cars at the Duluth docks are as follows:

	Yough	Splint	Hock	Smokeless	Elkhorn
Lump	$3.40	$3.40	$3.40	$4.75	$3.75
Dock run	3.10	3.10	3.10	3.25	3.25
Egg, stove and nut	3.40	3.40	3.40	4.75	3.65
Screenings	2.40	2.40	2.25	2.75	2.55

Anthracite business during the past week has been very good, the cold weather being responsible for a large number of "hurryup" orders. Prices are as follows: Nut, $7.10, stove and egg, $6.85, pea, $5.55 and buckwheat, $4, all per short ton f.o.b. cars at Duluth docks.

PRODUCTION AND TRANSPORTATION STATISTICS

NORFOLK AND WESTERN

Destination of shipments over this road for October and the ten months of this year and the last year were as follows, in short tons:

	October		Ten Months	
Coal	1914	1915	1914	1915

I. C. C. No. 6080—Elmore—Benjamin Coal Co., Et Al. vs. Chesapeake & Ohio Ry. Co., Et. Al.

Through rates on coal in carloads from the Kanawha and New River, W. Va., fields on lines of the Chesapeake & Ohio Railway Company to Milwaukee, Wis., not found to be unreasonable. Request for joint rates denied. Complaint dismissed.

CHICAGO LAKE RECEIPTS

Coal receipts at the port of Chicago and South Chicago, classifield according to shipping points, for the month ending Nov. 30, 1915, midnight, were as follows:

	1915		1914	
From	Hard	Soft	Hard	Soft
Buffalo	64,918		97,798	
Oswego	11,364		22,708	
Ashtabula		58,547	7,200	6,980
Sandusky		42,734		
Cleveland		39,695		19,832
Toledo		34,726		6,000
Fairport		10,015		
Erie	14,000			
November total	90,282	185,717	127,701	32,812
Season total	777,179	897,389	782,214	604,722

FOREIGN MARKETS

GREAT BRITAIN

Nov. 26—Tonnage arrivals are more ample and there is a prospect of a more active market. Quotations are approximately as follows:

Best Welsh steam	Nominal	Best Monmouthshires	$4.44
Best seconds	Nominal	Seconds	4.32
Seconds	$4.44	Best Cardiff smalls	2.82
Best dry coals	5.64	Cargo smalls	1.92

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport, both net, exclusive of wharfage.

Freights—Rates continue to rise and are approximately as follows:

Gibraltar	$5.79	Naples	$11.00	St. Vincent	$7.80
Marseilles	11.82	Alexandria	13.20	River Plate	9.60
Algiers	11.00	Port Said	13.20		
Genoa	12.48	Las Palmas	7.20		

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

+Indicates contracts regarding which official information has been received.

Supplemental Notes

Under this heading additional or supplemental information regarding old contracts appears, together with the page number of the original notice.

424—St. Louis, Mo.—This contract (Vol. 7, p. 568), which provides for the requirements of the Continental Portland Cement Co., will be negotiated about the twenty-fifth of each month. Approximately 4,000 tons of Carterville 1½-in. screenings per month are required for charging the kilns. The power plant of the company has been electrified. Address Pur. Agt., J. P. Terpenny, The Continental Portland Cement Co., Syndicate Trust Bldg., St. Louis, Mo.

1455—New Orleans, La.—This contract (p. 530), which provides for furnishing the Hotel De Soto with its annual fuel requirements, involving approximately 130 tons per month, will be awarded about the first of the year. Address Gen. Mgr. Vic Le Beau, Hotel De Soto, Baronne and Poydras St., New Orleans, La.

1581—New Orleans, La.—This contract (p. 700), which provides for furnishing the Leland Steamship Co. with approximately 50,000 tons of steam coal, will not be negotiated until toward the close of January. Address Purchasing Agent Leland Steamship Co., 1210 Hibernia Bank Bldg., New Orleans, La.

1643—Birmingham, Ala.—The customary price at which this contract (p. 870), which provides for furnishing the Birmingham Railway, Light and Power Co. with approximately 20,000 tons of coal is negotiated, is about $1.50 per ton. The business is let on competitive bids. Address Pur. Agt., Chas P. Doerr, Birmingham Railway, Light and Power Co., Birmingham, Ala.

1667—Ironton, Ohio—No bids were received on this contract (p. 912), which provides for furnishing the coal for the local pumping station, and readvertisements will be made, the date of opening the new bids to be Dec. 16. Address Clk. F. A. Ross, Bd. of Pub. Service, Ironton, Ohio.

1679—New York, N. Y.—Bids have been received on this contract (p. 912), which provides for furnishing anthracite and bituminous coal to the various public buildings, courts, etc., in the Borough of Manhattan, as follows:

	Buckwheat				
	No. 1	No. 2	No. 3	Broken	Mine-Run
Gavin Rowe (a)......	$1.72½	$1.50	$1.31	$2.79	$2.11½
Wm. Farrell & Son (b)	4.99	4.49	3.99	5.99	6.50

(a) These bids are on 1,000 lb. units. (b) These bids are on 2,000 lb. units. Address Pres. Marcus M. Marks, Room 2,032, 20th Floor, Municipal Bldg., New York, N. Y. (No. 19, **Vol. 6**, p. 892).

New Business

Volume and page number in parenthesis at the end of an item indicate where the previous announcement, bids and awards on that contract may be found.

1712—Pottstown, Penn.—The Wilbrahame Green Blower Co. usually send out inquiries on their annual fuel contract on Dec. 1, and close the business on Jan. 1. They consume about 600 tons per annum, and deliveries are by Philadelphia & Reading Ry. Address Pur. Agt. James, Wilbrahame Green Blower Co., Pottstown, Penn.

.1713—Pottstown, Penn.—The McClintic-Marshall Construction Co. usually contract for their annual fuel requirements, involving approximately 1,200 tons, on Jan. 1. Address Pur. Agt. Corbett, the McClintic-Marshall Construction Co., Pottstown, Penn.

+1714—Detroit, Mich.—The Board of Public Works will receive bids until 10 a.m., Dec. 31, for furnishing coal as follows: Steam coal, 2,000 tons of either mine-run or three-quarter lump for use at the Asphalt Plant to be delivered f.o.b. cars in the Western district yards; 50 tons of same to be delivered in wagon lots on the Belle Isle Bridge; 1,800 tons of three-quarter lump delivered in wagon lots at Fairview Pumping Station; 30 tons Jackson Hill three-quarter lump, to be delivered in wagon lots at the yard or barn, as directed. Anthracite—25 tons each of chestnut, stove and chestnut mixed in equal proportions, stove and egg coal, to be delivered at the yard or barn, as directed. Pocahontas lump—approximately 100 tons, to be delivered f.o.b. cars Eastern or Western district yards. Bidders are required to file a certified check for $1,000 with bids. Address Comr. Geo. S. Finkle, Dept. of Pub. Wks., Detroit, Mich. (Vol. 7, pp. 189, 231.)

+1715—Austin, Tex.—The Water and Light Dept. at this place usually contract for its annual fuel requirements, involving approximately 60 tons of lignite coal per day, about Jan. 1. The business is done on competitive bids, and the customary price is about $1.48 per ton. Address Supt. E. C. Bartholomew, Water and Light Plant, Austin, Texas.

1716—Reading, Penn.—The Reading Hardware Co. usually contract for their annual fuel requirements, involving approximately 5,000 tons, on Jan. 1. Address Pur. Agt. Isaac Treat, Reading Hardware Co., Reading, Penn.

1717—Reading, Penn.—The Penn Hardware Co. at this place usually contracts for its annual fuel requirements, involving approximately 3,000 tons, on Dec. 1. Address Purchasing Agent, Penn Hardware Co., Reading, Penn.

1718—Robesonia, Penn.—The Robesonia Iron Co. usually contract for their annual fuel requirements, involving approximately 35,000 tons, on Jan. 1. They also require some low phosphorus 42-hr. coke. Deliveries are made by Philadelphia & Reading Ry. Address Supt. S. B. Pattison, Robesonia Iron Co., Robesonia, Penn.

1719—Riverside, Penn.—Wm. F. Taubell, Inc., usually contract for their annual fuel requirements, involving approximately 8,000 tons, on Jan. 1. Address Pur. Agt. Wells, W. F. Taubell, Inc., Riverside, Penn.

1720—Salem, N. J.—The Gayner Glass Works usually contract for their annual fuel requirements, involving approximately 4,000 tons on Jan. 1. The company ordinarily uses South Fork coal. Address Pur. Agt. Gayner, the Gayner Glass Works, Salem, N. J.

1721—Salt Lake City, Utah—Bids were received until 3 p.m., Dec. 8, for furnishing the Utah State Prison with approximately 100 tons of lump, and 600 tons of screened slack coal during the ensuing year. Deliveries are to be f.o.b. track at the State Prison. All bidders must submit a certified check for 5 per cent. of the amount of their bids. Address Warden Arthur Pratt, Utah State Prison, Salt Lake City, Utah.

1722—Quenelda, Ala.—The Quenelda Graphite Co., usually contracts for its annual fuel requirements, involving approximately 1,560 tons of bituminous coal, about Jan. 1. Deliveries are made by railroad at the rate of about 130 tons per month, and the company has storage capacity for 150 tons. Address Pur. Agt. J. Warren May, Quenelda Graphite Co., Quenelda, Ala.

1723—Russellville, Ky.—The Light and Power Dept. at this place usually contracts for its annual fuel requirements, involving approximately 2,880 tons of bituminous mine-run, about Jan. 1. The business is done on competitive bids, and the customary price is about 87½c. per ton. Address Clk. C. W. Andrews, The Light and Power Co., Russellville, Ky.

1724—Minneapolis, Minn.—The Electric Short Line Ry. Co. at this place usually contracts for its annual fuel requirements, involving approximately 2,200 tons of Youghiogheny dock-run, about Jan. 1. Deliveries are made by railroads at the rate of six cars per month, and the company has storage capacity for 150 tons. Address Gen. Mgr. D. K. Hunter, Electric Short Line Ry., 809 Phoenix Bldg., Minneapolis, Minn.

1725—Chambersburg, Penn.—The Wolf Co. at this place usually contracts for its annual fuel requirements, involving approximately 2,250 tons of bituminous mine-run coal, about Jan. 1. Deliveries are made by railroad at the rate of one car per week, and the company has storage capacity for 300 tons. Address Pur. Agt. Frank Duncan, The Wolf Co., Wolf St., Chambersburg, Penn.

1726—Elkhart, Ind.—The Elkhart Bristol Board and Paper Co. are in the market for approximately 3,500 tons of West Virginia mine-coal coal, deliveries to start Feb. 1 and to be made in regular weekly proportions. Address Pres. C. E. Frye, The Elkhart Bristol Board and Paper Co., Elkhart, Ind.

+**1727—Denver, Colo.**—The City Government will receive bids until 10 a.m., Dec. 13, for furnishing coal, to be delivered in carload lots, at the municipal coal yard, corner of 19th and Kalamath St., of the following grades: Northern Colorado lignite; Canon City or Walsenburg bituminous; anthracite; Routt County. Bids will also be received for furnishing and delivering coal from the same fields to the various city departments. On the business providing for carload deliveries, shipments must be made within 24 hr. of the receipt of the order, and on the business to be delivered to the various city departments, such delivery must be made within 24 hr. The successful bidder on either of these specifications will be required to furnish a bond for $5,000. Address Comr. Clair J. Pitcher, Room 209, City Hall, Denver, Colo.

+**1728—Cambridge, Mass**—The Cambridge Water Board received bids until 11 a.m., Dec. 7, for furnishing the local pumping station with approximately 1,000 long tons of coal during the next six months. Deliveries, if by rail (Boston & Maine R.R.), are to be made immediately, and if by team are to be made at the rate of ten tons per day, beginning Dec. 14. The successful bidder will be required to furnish a bond for 25 per cent. of the amount of the contract. Address Gen. Supt. Edward W. Quinn, Cambridge Water Works, Cambridge, Mass.

1729—Kansas City, Mo.—The Abernathy Furniture Co. at this place will contract about Jan. 1 for its annual fuel requirements for both the Kansas City and Leavenworth branches. The company uses about one carload per week of Cherokee slack at the Kansas plant and about half as much at the Leavenworth. Address Purchasing Agent, Abernathy Furniture Co., Kansas City, Mo.

1730—Uhrichsville, Ohio—The Evans Clay Manufacturing Co. at this place are in the market for a tonnage of West Virginia, Pennsylvania or Kentucky bituminous lump coal. Address Purchasing Agent, The Evans Clay Manufacturing Co., Uhrichsville, Ohio.

+**1731—New Orleans, La.**—The City Government will soon request bids for its annual fuel supply, involving approximately 15,000 short tons of coal, for the various city buildings and departments. The present contract is held by the Tennessee Coal, Iron and R.R. Co. and expires on Jan. 28, the business having been taken at $3 per short ton for Pratt mine-run and $3.25 for Cahaba egg coal. The successful bidder will be required to furnish a bond for $500. Address Commissioner of Police and Public Buildings, Room 27, City Hall Building, New Orleans, La.

1732—Lima, Ohio—The Solar Refining Co. at this place will be in the market early in January for its annual fuel requirements, involving approximately 45,000 tons of mine-run, and 30,000 tons of nut and slack coal. Address Pres. J. G. Neubauer, The Solar Refining Co., Lima, Ohio.

1733—Union City, Mich.—The Peerless Portland Cement Co. at this place usually contracts for its annual fuel requirements, involving approximately 10,000 tons of three-quarter lump and 35,000 tons of coarse slack coal, about Jan. 1. Deliveries are made by rail at the rate of about 40 tons of lump, and 110 tons of slack per day. The company has storage capacity for 1,800 tons. Address Mgr. W. M. Hatch, Peerless Portland Cement Co., Union City, Mich.

1734—De Queen, Ark.—The De Queen Ice and Light Co. at this place usually contracts for its annual fuel requirements, involving approximately 2,000 tons of slack and crushed mine-run coal, about Jan. 1. The business is done on competitive bids, and usually goes at $2.50 per ton for the slack and $3 for the mine-run. Address Purchasing Agent, The De Queen Ice and Light Co., De Queen, Ark.

1735—Tarentum, Penn.—The Borough Light Plant at this place usually negotiates its annual fuel contract, involving approximately 3,000 tons of mine-run coal, about Jan. 1. The business is usually let at about $1.50 per ton, and is done on competitive bids. Address Supt. J. C. Turner, Borough Light Plant, Tarentum, Penn.

1736—South Whitley, Ind.—The Light and Water Plant at this place usually contracts for its annual fuel requirements, involving from 1,500 to 1,800 tons, about Jan. 1. Bids are requested on different grades of steam coal, and a guarantee of the heat value must accompany each bid. Address Treas. F. E. Fox, Light and Water Plant, South Whitley, Ind.

1737—Philadelphia, Penn.—The Pennsylvania Salt Manufacturing Co. is in the market for its annual supply of anthracite rice coal, amounting to about 45,000 tons. Address Purchasing Agent, The Pennsylvania Salt Manufacturing Co., Widener Bdg., Philadelphia, Penn.

1738—Atlantic City, N. J.—The Atlantic City Gas Co. is in the market for its annual fuel requirements, involving approximately 10,000 tons of broken coal, delivery to begin Jan. 1. Address Superintendent, The Atlantic City Gas Co., Atlantic City, N. J.

1739—Philadelphia, Penn.—The W. J. McCahan Sugar Refining Co. is in the market for its annual fuel requirements, involving approximately 15,000 tons of anthracite buckwheat, delivery to begin Jan. 1. Address Purchasing Agent, The W. J. McCahan Sugar Refining Co., Tasker St., Delaware River, Philadelphia, Penn.

1740—Madison, Ill.—The coal contract of the International Cooperage Co., involving approximately 5 or 6 cars of Standard 2-in. lump coal per month, will expire on Dec. 31. The company has not yet decided upon how long it will contract for. Deliveries are made via the Terminal. Address Pres. Martin Snider, 911 Sweetland Bldg., Cleveland, Ohio.

1741—Philadelphia, Penn.—N. Snellenburg & Co. is in the market for its annual fuel requirements, involving approximately 10,000 tons of anthracite buckwheat coal. Deliveries are to be made at the company's warehouse at 10th and Berks St., during the year beginning Jan. 1. Address Purchasing Agent, N. Snellenburg & Co., 12th and Market St., Philadelphia, Penn.

1742—Milford, N. J.—The Crown Wall Paper Manufacturing Co., Inc., is in the market for its annual fuel requirements during the ensuing year, amounting to between 800 and 1,000 tons of bituminous coal. Address Purchasing Agent, Crown Wall Paper Manufacturing Co., Inc., Milford, N. J.

1743—Philadelphia, Penn.—The Baldwin Locomotive Works is in the market for about 7,000 tons of anthracite broken coal, delivery to be made during the year beginning Jan. 1. Address Purchasing Agent, The Baldwin Locomotive Works, Philadelphia, Penn.

1744—St. Louis, Mo.—The Wilson Stove Manufacturing Co. at this place is in the market for its annual fuel requirements, involving approximately 80 tons per month of 2-in. screened lump coal. Address Pur. Agt. S. H. Long, The Wilson Stove Manufacturing Co., St. Louis, Mo.

1745—Martins Ferry, Ohio—Bids will be received until noon, Dec. 13, for furnishing the Municipal Electric Light and Power Plant with its coal requirements during the ensuing year. From 3,000 to 4,000 tons of bituminous mine-run are required, and the usual price is around $1.45 to $1.50 per ton. Specifications may be had on application. Address Dir. E. Brown, Pub. Ser., Martins Ferry, Ohio. (No. 215, Vol. 7, p. 446.)

+**1746—New York, N. Y.**—The Department of Docks and Ferries will receive bids until noon, Dec. 20, for furnishing coal as follows: A mixture of 30% bituminous and 70% buckwheat, 15,000 tons to be delivered at St. George and 5,000 tons at 39th St., Brooklyn; for the Dock Department, 2,000 tons of No. 3 buckwheat. Address Comr. of Docks R. A. C. Smith, Pier "A," New York. (No. 1583, Vol. 8, pp. 700, 828.)

Contracts Awarded

Note—Successful bidders are noted in **bold face** type.

+**1215—Springfield, Ohio**—This contract (p. 245), which provides for furnishing the City Government with coal for the Water Works during the ensuing year, has been awarded to the **Chas. E. Grube Coal Co.**, at $2.38 per ton. Address City Mgr. Ashburner, Springfield, Ohio.

1457—Sharpsburg, Penn.—This contract (p. 530) which provides for furnishing the St. Mary's Church and various buildings of the Parish, has been awarded to **Walter Bros.**, at $1.70 per ton for mine-run coal. Address Rev. John Otten, 210 Penn St., Sharpsburg, Penn.

+**1605—Frankfort, Ky.**—This contract (p. 737), which provides for furnishing the Capitol Heating Plant, and other state buildings with coal during the ensuing year, has been awarded to the **R. A. Brawner Coal Co.** Address Custodian Samuel M. Lykins, Capitol Bldg., Frankfort, Ky.

1634—Granite City, Ill.—This contract (p. 870), which provides for furnishing the American Steel Foundry Co. with its annual fuel requirements, has been awarded as follows: **Mt. Olive & Staunton Coal Co.**, 2,500 tons of 1½-in. screenings per month; **Donk Bros. Coal and Coke Co.**, 600 tons of Nos. 3 and 4 washed coal per month; **Consolidated Coal Co.**, 150 tons of lump coal per month. No prices have been announced, but it is understood that screenings contract was closed at 60c. per ton. Address Pur. Agt. T. E. Moritz, American Steel Foundry Co., Chicago, Ill.

1649—Denver, Colo.—This contract (p. 871), which provides for furnishing the Mine and Smelter Supply Co. with a 30- or 40-ton car of Piedmont coal, has been awarded to the **Pennsylvania Coal and Coke Corporation.** Address Gen. Pur. Agt. W. B. Kinkead, The Mine and Smelter Supply Co., Denver, Colo.

1673—Muncie, Ind.—This contract (p. 912), which provides for furnishing the City Government with coal for use at the local Garbage Plant, has been divided between two parties as follows: **C. Taylor,** local agent for the Litz-Smith Fuel Co., of Huntington, W. Va., 4 to 6 cars of Shamrock Island Creek 1½-in. lump at $2.65 per ton, and the balance to **C. Cranor,** who will furnish Winifred ¾-in. lump at $2.75 per ton. Address City Clerk, Muncie, Ind.

+1682—Crosby, N. D.—This contract (p. 912), which provides for furnishing the local court house, jail and sheriff's office with coal during the year beginning Jan. 1, has been awarded to **T. S. Semingson** at $3.20 per ton for screened coal. Emil Simonet bid $3.25 per ton. Address County Audr. W. E. Vadnais, Crosby, N. D.

Contract Notes

Belleville, Ill.—The contract for furnishing the County Jail, Farm and Court House with coal during the ensuing year, has been awarded to **Louis Reuther** at $5.88 per hundred bushels.

Toledo, Ohio—The contract for furnishing the Toledo Railways and Light Co. with approximately 20,000 tons of high-grade West Virginia nut and slack coal, has been awarded to the **Wyatt Coal Co.**

New Britain, Conn.—The requirements of the Beaton & Cadwell Manufacturing Co. (p 960), have been covered until April of 1916. Address Pur. Agt. W. H. Cadwell, Beaton & Cadwell Mfg. Co., New Britain, Conn.

Auburn, Me.—The contract for furnishing Fitz Bros. at this place with approximately 500 to 800 tons of bituminous coal, has been awarded to **Pulsifer & Young.** The contract runs only to some time in the spring.

Canton, Ohio—The J. C. Niely Co. at this place are desirous of getting in touch with two or three good coal companies in that vicinity. Address Pur. Agt. J. C. Niely, The J. C. Niely Co., 900 3rd St., S. E., Canton, Ohio.

Worcester, Mass.—The General Supply Co. at this place require about 10 cars per month of anthracite and bituminous coal, deliveries being made by railroad. Address J. A. Hubbey, General Supply Co., 134 Exchange St., Worcester, Mass.

Buffalo, N. Y.—The requirements of the Ericsson Mfg. Co. (p. 960), involving approximately 1,200 tons of Youghiogheny three-quarter coal per annum, are covered until Sept. 1 of 1916. Address Pur. Agt. H. R. Dilks, Ericcson Mfg. Co., Buffalo, N. Y.

St. Louis, Mo.—The contract for furnishing Henry Gaus & Sons with approximately 100 tons of lump coal per month, has been awarded to the **Rutledge & Taylor Coal Co.** Address Pur. Agt. J. H. Ahrens, Henry Gaus & Sons, St. Louis, Mo.

St. Louis, Mo.—The contract for furnishing L. P. Bresh & Bro. with approximately 50 tons of lump coal per month was recently awarded to the **Lumaghi Coal Co.** on their "Black Brier" coal. Address Pres. L. P. Bresh, L. P. Bresh & Bro., St. Louis, Mo.

Buffalo, N. Y.—The Buffalo Southern Ry. Co. at this place consume about 3,000 tons of bituminous three-quarter lump per annum, deliveries being made by rail at the rate of about 250 tons per month. Address Pur. Agt. N. A. Bundy, Buffalo Southern Ry. Co., Buffalo, N. Y.

Effingham, Ill.—The contract for furnishing the Mullin-Blackledge-Nellis Co. with about two cars per week of egg coal has been awarded to the **Lumaghi Coal Co.** on their "Cantine" coal. Address Mgr. and Pur. Agt., A. J. Blackledge, Mullin-Blackledge-Nellis Co., Effingham, Ill.

St. Louis, Mo.—The contract for furnishing the St. Louis Paper Can and Tube Co., with about 90 tons of coal per month, has been awarded to the **Polar Wave Ice and Fuel Co.,** on Standard 2-in. lump coal. Address Pur. Agt., Kriechenmeister, St. Louis Paper Can and Tube Co., St. Louis, Mo.

St. Louis, Mo.—The contract for furnishing the Commonwealth Steel Co. with approximately 100 tons of 2-in. screenings per day, has been awarded to the **Breese Trenton Coal and Mining Co.,** on "Breese" screenings. Address Pur. Agt. Cartan, The Commonwealth Steel Co., St. Louis, Mo.

Highland, Ill.—The contract for furnishing the Lund-Maulding Shoe Co. with its annual fuel requirements, involving approximately 80 tons per month, has been awarded to the **Lumaghi Coal Co.,** on their "Cantine" 2-in. lump. Address Pur. Agt. R. L. Lund, Lund-Maulding Shoe Co., Highland, Ill.

Granite City, Ill.—The contract for furnishing the Draper Manufacturing Co. with approximately 80 tons per month of 2-in. screened nut coal, has been awarded to the **Lumaghi Coal Co.** on their "Cantine" coal. Address Pres. and Pur. Agt. C. L. Draper, Draper Manufacturing Co., Granite City, Ill.

St. Louis, Mo.—The contract for furnishing the Columbia Incandescent Lamp Co. with approximately 175 tons of No. 4 washed pea coal during the period from Nov. 1 to May 1, has been awarded to **Donk Bros. Coal and Coke Co.** Address Mgr. C. A. Dalton, Columbia Incandescent Lamp Co., St. Louis, Mo.

Sandusky, Ohio—The contract for furnishing the Sandusky Gas and Electric Co. with approximately five cars per week of West Virginia ¾-in. lump coal, was recently awarded to **Bert D. Smith** until Apr. 1, 1916. It is understood the coal will come from the Smithers Creek mine of the Sunday Creek Coal Co.

St. Louis, Mo.—The Boehmer Coal Co. will furnish the Union Electric Light and Power Co. with coal until Apr. 1 next. The Light and Power Co. has recently closed important large contracts for furnishing steam and electric power. Address, Pur. Agt. Union Electric Light and Power Co., St. Louis, Mo.

Alton, Ill.—No bids were received for furnishing the Madison County Poor with coal during the coming winter because the appropriation for this purpose has been exhausted. The orders will be distributed among local dealers who will have to carry their bills over until next spring. Address Postmaster Hermann, Alton, Ill.

St. Louis, Mo.—The contract for furnishing the Williams Patent Crusher and Pulverizer Co. with approximately 90 tons of Herrin No. 7 coal per month (p. 960), was awarded at $1.35 per ton. The contract expires in September of next year. Address Pur. Agt. W. J. Hanson, Williams Patent Crusher and Pulverizer Co., St. Louis, Mo.

St. Louis, Mo.—The contract for furnishing the Manchester Ave. Plant of the National Lead Co., with approximately 500 tons per month of 1½-in. screenings, has been awarded to the **Big Muddy Coal and Iron Co.;** the Collier plant will purchase its supply in the open market. Address Pur. Agt. W. M. Lowery, National Lead Co., St. Louis, Mo.

St. Louis, Mo.—The contract for furnishing the Wm. Waltke Soap Co. with approximately 125 tons per week of 2 in. screened nut coal has been awarded to the **Haddaway Curd Coal Co.** which is shut down temporarily, and the contract is being filled by the Northern Coal Co. Address Pres. and Pur. Agt. Wm. Waltke, Wm. Waltke Soap Co., St. Louis, Mo.

Louisville, Ky.—The Central Coal and Iron Co. concluded a five-year contract covering their annual fuel requirements involving from 1,000 to 1,200 tons of pea and slack coal in June of this year. Deliveries are made by wagon at the rate of 85 to 100 tons per month. Address Pur. Agt. P. M. O'Reilly, Central Coal and Iron Co., 4th and Market St., Louisville, Ky.

Rome, Italy—The sailing of the steamship "Kaupanger" from Philadelphia recently with 2,400 tons of anthracite, and 1,500 tons of coke for Genoa marked the inauguration of a new coal service with Italy. It is reported that many cities in Italy are suffering acutely from the lack of coal. The shortage is particularly serious in Trieste, where the price of illuminating gas has advanced considerably.

St. Louis, Mo.—The contract for furnishing the Mississippi Glass Co. with its annual requirements of coal involving approximately 120 tons per day of Carterville No. 1 washed nut for gas producer use, has been awarded to the **Peabody Coal Co.** at a price understood to be $1.25 per ton f.o.b. cars at washer. This coal carries a freight rate of 72½c. per ton. Address Pur. Agt., E. Wallace, Mississippi Glass Co., St. Louis, Mo.

St. Louis, Mo.—The contract for furnishing the St. Louis Screw Co. with its annual fuel requirements involving approximately 1,500 tons of No. 5 unwashed slack per month, has been awarded to the **Berry-Bergs Coal Co.,** while the boiler requirements of the company, amounting to approximately 200 tons of No. 4 washed pea and No. 3 washed nut per month, was awarded to **Donk Bros. Coal and Coke Co.** Address Gen. Mgr. C. P. Burgess, St. Louis Screw Co., St. Louis, Mo.

Denver, Colo.—The Denver Gas and Electric Co. have a contract with the **Cedar Hill Coal and Coke Co.** for furnishing the fuel requirements at their gas plant, involving approximately 250 tons per day, which runs for three years. The contract for supplying the power plant with approximately 200 tons per day expires in about a year and a half, and is held by the **Rocky Mountain Fuel Co.** Address Vice-Pres. and Gen. Mgr. W. J. Barker, Denver Gas and Electric Light Co., Gas and Electric Bldg., Denver, Colo.

COAL AGE

Vol. 8 NEW YORK, DECEMBER 18, 1915 No. 25

The Christmas Message

Peace on earth, good will toward men

WHERE? An American schoolboy can answer that. Here in America, but not on the other side of the ocean.

Just around the corner from our office is a politician orating on the subject of preparedness. (Everybody is doing it or will be doing it before Congress adjourns in the Spring.) And what is he saying? Well, among other things he is saying that our mine workers and our mine owners must be made to pull together before it is too late if we would profit by the mistakes of our brothers across the water.

Some day we may have to mobilize our mines and our mills as well as our army, and then we shall have to appeal to the patriotism of all. The English have found that such patriotism cannot always be taken as a matter of course. Since the orator is only a politician, he can't be expected to express himself too clearly, but somehow we don't have trouble to understand such words as mobilize and preparedness, which he repeats again and again. It seems as if they had always had a place in our everyday vocabulary, peace loving though we are.

It's all very well to deplore the fact that civilization seems to have gone to pieces on the other side of the ocean, but while we are doing that, prudence suggests that we do not close our eyes to everything that is going on around us. It hasn't been so long since we considered Europe as on a permanent peace footing.

Peace on earth, good will toward men

HERE is a labor organization whose leaders are crying, "Down with the state militia—we will have nothing to do with it." Where are they going to lead us?

Here is an operator who is demanding that he be left to follow the dictates of his own conscience in dealing with his men. His forefathers dealt with the Indians, guided by their conscience only.

And here is a lawmaker who proposes a law to make it illegal for corporations to employ guards for their properties in times of mob reign, nor does he realize that he is taking sides in a conflict. Again, here is a community clamoring for pardons to be given a veritable army of murderers because punishment or confinement will not cure crime.

How easy it is to get in tune with the spirit of strife.

Perhaps after all we too may profit by the Christmas message, and in spite of all our presumptions to the contrary would present but a sorry spectacle should we attempt to sit in judgment upon the civilization across the seas.

Peace on earth, good will toward men

No, we have not outgrown the need of such a Christmas message, we men of the mines.

Ideas and Suggestions

Cashing In One's Experience

How many of you mining men make it a rule to profit only by your own experience in the mining game?

Several years ago most of you would have answered like the man at the altar about to be married. We had not then progressed to the point where the other fellow's experiences are almost as freely at our disposal as our own. We were not as used then as we are now to trade journals containing the cream of interchangeable ideas and experiences.

But with all the means at our disposal, how many of us continue to cash in only our own experiences and how few are willing to accept gratis a few shares of the other fellow's stock, which would enable us to draw dividends from his investment?

Experience is often another definition for mistakes. The man who is a failure is the one who has blundered and is not able to cash his experience. The trouble in the coal-mining business is that it takes too many mistakes to produce an adequate supply of experience, and after all there is no reason why a man's supply need be acquired in this way.

Coal Age is constantly trying to present interestingly facts and experiences of the mining game which will benefit its readers. Every good suggestion on the Foreword page or elsewhere is born of some experience. Some blunder was made and the forfeit paid; then came the remedial idea, and the result of its application is given to the workers all along the line.

Eliminating Idle Hands

Do you want to run your plant with only as many men as are necessary for its safe operation? Of course you do, and you believe you are until careful scrutiny shows up a man who could be dispensed with. You don't want it to happen again, do you? Of course not. Then look through your trade-journal files. You'll be almost sure to find a good scheme of daily quota sheets which will help you to avoid it in future.

You don't want straw men on your roll? You hardly see how they could get there, do you? But you read about it every now and then in companies whose payroll plan is about like your own. Many suggestions and definite plans have been noted regarding this. Better look back through your files and avail yourself of systems employed by concerns that have encountered this same trouble. It may save you the cashing in of a very expensive experience.

Do you want to know how to keep an adequate stock of mine supplies without tying up too much money? You'll find many a good suggestion you can utilize to help accomplish this, such as the right kind of stock sheets, classification, etc.

Do you want "safety first," and do you want to work out policies of welfare and all that kind of thing for the benefit of your employees? You can have it in large measure simply by reading what the other fellow has found best. You can work your policies out the same way at no extra cost for his experience.

I know a man whose plan of making subscriptions for trade journals pay is to take each issue and index the best suggestions of any kind. He puts them in effect and makes a record of the result in actual money saving. At the end of the year the price of the subscription has been returned manyfold.

Don't permit yourself to believe that you can't realize on the other fellow's experience. All you've got to do is to get busy and do it.

❖

Just Plain Horse Sense

Nearly everybody has some idea that horsepower is a standard for estimating the power of steam engines.

Horse sense may be defined as a standard for measuring the power of men's minds as applied to practical things. It is a quality of mind for which executives are always looking, and for which they are willing to pay a good price.

Recently when visiting another man's plant (a big one too) I ran across a horse-sense man.

His company had successfully weathered two dull years. A look through the supply house showed what seemed to be an abnormally low stock for an operation of that size. My first thought was that the recent hard times were responsible for the small quantity of supplies, but a remark concerning this matter struck home, and the "milk in the cocoanut" was revealed.

"No, sir," the official in question replied, "we don't let our people order stuff we can get along without. We don't countenance waste, and we can't afford to tie up cash in surplus stores."

Then he told me a little story. Taken out of his mouth and told in my own way, it ran like this:

"Passing through our machine shop one day I saw a barrel full of waste material. My master mechanic said it was old junk, packing, etc., that was no good. I said nothing then, but that night I went down and emptied the barrel. It was nearly full of packing, which I carried to the storeroom. Taking the packing of similar sizes out of new boxes in stock, I substituted the old and hid the new. Later my master mechanic used it all without a word, and I never told him what I had done until the right time. Now he knows how to use packing."

It was a clean-cut case of plain horse sense, and in my mind I had to hand it to the superintendent (for it was he) who showed me around.

I thought of supply houses I had seen at other mines where stock was carried far in excess of requirements and especially of one place where the surplus packing spoiled through deterioration and was utterly lost.

There is a moral: Plain horse sense practically applied always pays.

Have you a horse-sense man? Pay him well and keep him with you. If you haven't such a man, look about and find one soon.

A Man's Courage

By William Jardine*

Courage in man is a subtle quality, and its expressions are as varied as human nature itself. To the mining man it is a necessity, and its possession frequently means success.

There is the silent, intelligent courage of the "plodder" and the bold, reckless courage of the "hustler."

A man without this quality, if employed at the head of an operating concern, is miserably lost.

He ceases to be a "live wire." Have you noticed the other fellow get promotion and wondered why he got it? Did you go out and congratulate him, or did you stay back and say to yourself, "It is I that should have been promoted?"

Are you responsible for your position as a worker? Have you the necessary Twentieth Century push? Examine yourself and determine how to act. *Act today.* We desire to better our position, and the number of attempts to accomplish those desires bear adequate testimony to unflinching courage.

Work in earnest, combine dignity and interest with your work, and you will "get there." Above all, "have the courage of your convictions."

⁂

Taking a Chance

By George N. Lantz†

The mine where I am employed has been running on short time, and on idle days only a few men are on the job—the mine-boss, the engineer, the blacksmith, the pumper, the stable-boss and myself.

Yesterday the engineer, as he frequently does, asked me to go to the hoppers for boiler coal. I took the motor and backed the empty trip to the hoppers. I backed into the loaded cars on the hoppers very carefully, but they started to move slowly, and before I could get to them from the motor, the end of the trip had run through the hopper wall. Result—two broken cars, two twisted rails, repairs on the return switch and a loaded car off the track, while the coal from the two wrecked cars had to be hauled by wagons and loaded on mine cars.

The accident might have been prevented in any one of these three ways: I could have taken someone along to couple the loads to the empty trip, but the blacksmith was busy, the engineer could not leave his engine and both the mine-boss and stable-boss were out of sight. I could have switched the empty trip and taken a light motor. I could have stopped the trip before I reached the loaded cars until I had assured myself that enough brakes were set to hold the trip. Instead of doing this, however, I "took a chance."

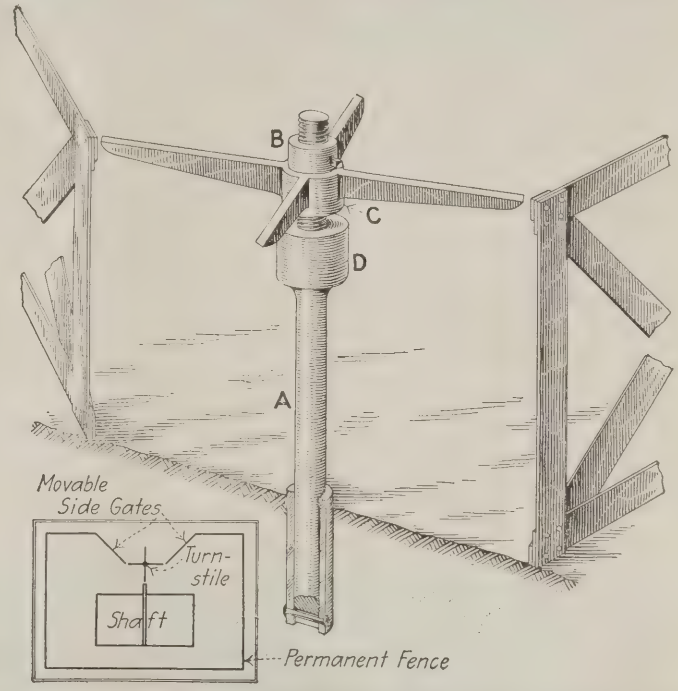
I relate this incident because it is a rather impressive lesson in the need of "safety first" at all times and not spasmodically. I have consistently advocated "safety first," and as a rule I practice what I preach. And this one violation of a self-imposed rule of conduct will not prevent me from continuing to preach and to practice the "safety first" rule.

The "safety first" movement is gaining ground. The cautious man is coming in for the same sort of admiring approval that the reckless man claimed a few years ago. We frequently hear the question, "Which way is the safest?" when miners are undecided on a plan to take in doing their work, and often the easiest or the quickest way is discarded in favor of the safest way. The old rule of "take a chance" is being supplanted by "safety first."

⁂

A Simple Shaft Gate

The shaft gate illustrated herewith is used at the colliery of Jermyn & Co., at Rendham, Penn. Its purpose is to limit the number of men who can get on the cage at one time. The post *A*, which may be a piece of old shafting, is slotted at the bottom and threaded at the top. The four-armed turnstile *C* screws up and down on this post. Its motion is limited by the collar *B*, which can be fixed in any position by the setscrews.



DETAILS OF A SAFE AND PRACTICAL SHAFT GATE

As used at Rendham, the stile makes 2½ turns, this allowing 10 men to pass to one side of the shaft. When this number has passed, the stile is turned in the other direction by the men passing into the other cage.

When the shaft is being used for coal or supplies, the gate is lifted out of the socket and set aside. The side gates are light enough to be easily handled by one man. These are lifted out of the way when not in use. This arrangement, devised by Superintendent Corcoran, prevents men from crowding onto the cages in larger numbers than would be safe or allowable by law.

⁂

How many thousands of coal-mine employees are at their jobs just to see "how much they can get out of it" rather than to determine "how much they can put into their work"!

⁂

There are many people who do not sympathize with the cry of "over-production." They attribute the "high cost of living" to under-production per human unit and contend that under-production is the direct cause of under-consumption through lack of capacity to purchase.

Compressed Air in Construction and Repair Work

By Charles C. Phelps*

SYNOPSIS—For certain kinds of work compressed air is preëminently adapted. It is also often desirable to take the tools to the work rather than to bring the work to the shop. In such instances the portable motor-driven air compressor may be used to advantage.

In connection with construction and repair work both above and under ground there are many operations that can be performed much more economically and expeditiously with the assistance of compressed air than by any other known means. In many instances it might not be advisable to construct a stationary compressor plant or to pipe air from an existing plant located at a distance, owing to the temporary character of the work.

The average uptodate coal-mining property is equipped with an electric transmission system, and under these circumstances, one of the most convenient means of obtaining compressed air for use in construction and repair work is by employing electric motor-driven portable compressors. Truly successful apparatus of this type is of comparatively recent development, and it is the intention to discuss in this article only the various types of electrically driven outfits and their uses. It should be borne in mind, however, that corresponding machines driven by other prime movers, such as gasoline, oil or steam engines, are sometimes better adapted to existing conditions and, as a matter of fact, are in extensive employment.

Construction that must be prosecuted at one time or another outside of the coal mine usually involves rock cuts and the removal of boulders in connection with grading for tracks or roads, digging trenches and pits, removing old concrete and masonry construction and the like. For these purposes Jackhamers, operated by compressed air, are highly economical, drilling from 100 to 200 ft. of hole per shift, whereas one-tenth of this footage could not be obtained in all probability in the same time by hand.

In building concrete foundations, culverts, bridges, dams, sluices, buildings, etc., pneumatic concrete rammers are often used to advantage. A Belgian engineer who made a study of this subject found that the number of blows struck played a far more important part in compacting the concrete than the force of the blow. It follows that the pneumatic rammer, which strikes approximately 600 light blows per minute, is ideal in comparison with hand ramming in which the maximum speed obtained is 50 or 60 blows per minute. This conclusion is verified by a test made with small cubes in which 60 blows left the concrete with a resistance of 2,844½ lb. per sq.in., 40 blows with 2,460¾ lb. and 20 blows with 1,538 lb. A similar test with hand ramming gave a resistance of only 939 lb. per sq.in. The hand rammer used weighed 33 lb. and was permitted to fall from a height of 20 in.

It is apparent that by obtaining a stronger product by tamping, a lighter structure will often serve the purpose, saving considerably in cost of materials and workmanship. Pneumatic tampers of a different type are being adopted extensively for tamping railroad ballast.

In the construction of steel or wooden bridges or trestles, laying tracks and erecting steel or wooden structures of various kinds, pneumatic tools are invaluable. Pneumatic drills, are used for drilling metal, boring wood, reaming, tapping, operating jacks, cranes, hoists and grinding wheels and small circular saws. They are also of great advantage for running in lag screws and tightening nuts. In one case a gang of seven men put up from 80 to 100 hangers in 9 hr., each supported by two ¾-in. lag screws. The holes were bored with pneumatic augers using ⅝-in. bits, later driving the screws home by means of the same motors used with extension sockets. This is at least double the work that could be performed under similar conditions by using augers and wrenches operated by hand.

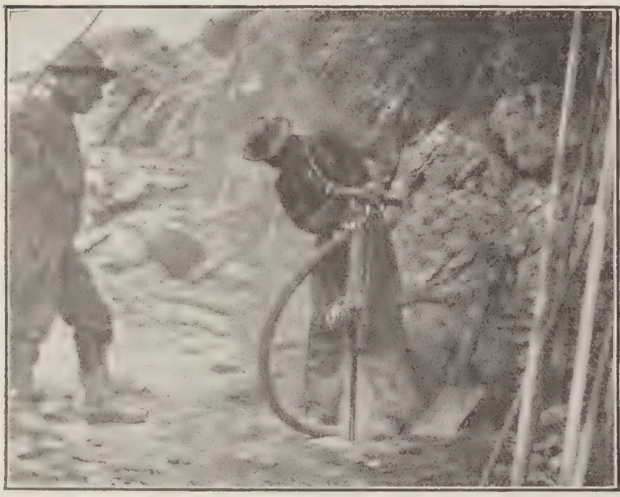

FIG. 1. MAKING A ROCK CUT WITH JACKHAMERS

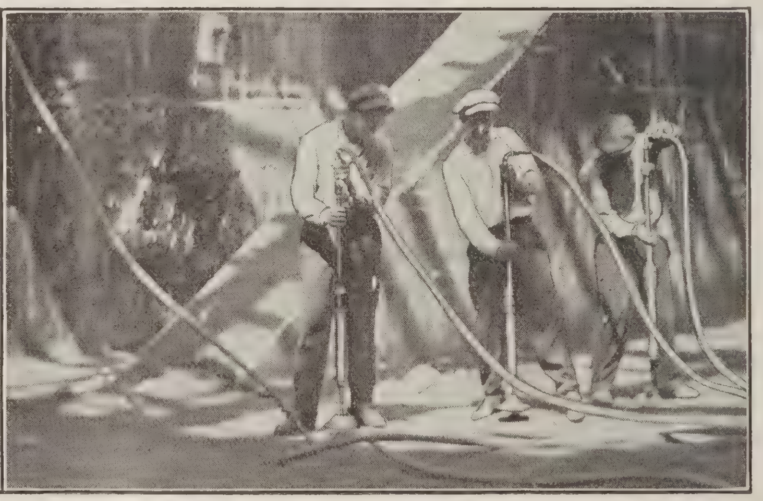

FIG. 2. PNEUMATIC CONCRETE RAMMERS IN OPERATION

---

*New York City.

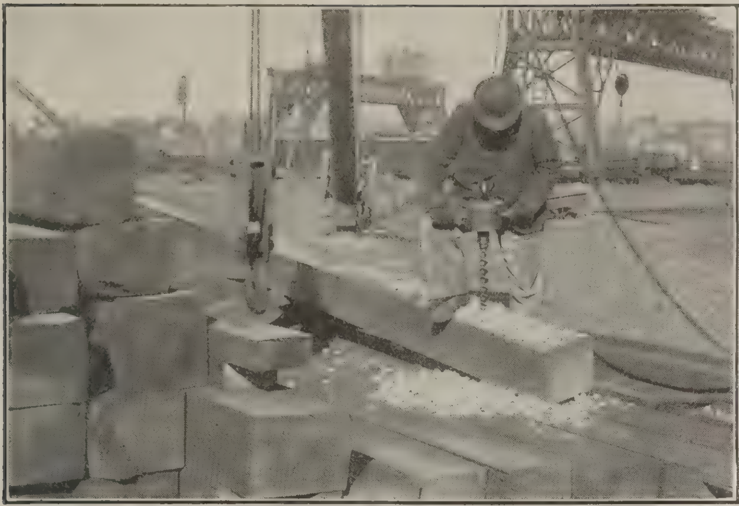

FIG. 3. A PNEUMATIC AUGER IN OPERATION

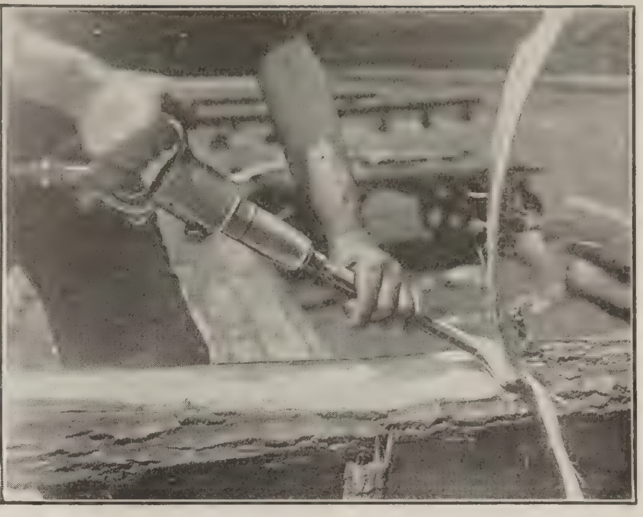

FIG. 4. CHIPPING HAMMER USED FOR TIE PEELING

There is no comparison to be made between pneumatic riveting hammers and hand methods for heading rivets. Compressed air is also convenient for blowing rivet-heating forges. Riveters can be fitted with a handy rivet "busting" attachment and have been adapted to driving spikes. In one case they were used for driving 9-in. spikes at the remarkable rate of 5 sec. each. On the same job a number of ⅞-in. bolts 38 in. long were each driven by compressed air in 1 min. as against 18 min. by hand.

Pneumatic chipping hammers are invaluable for trimming, cutting and calking metal and may be fitted with a special chisel for such work as peeling the bark from logs in preparing ties or props. This last is a new application of this tool which is capable of great savings. It is said that the most expert tie peeler is capable of peeling by hand an average of 100 ties per day of 10 hr., but the average output is nearer 50 ties per day. Experiments have shown that an inexperienced laborer has no difficulty in thoroughly peeling from 150 to 200 ties per day with the tool illustrated in Fig. 4. These tools do not consume much air, but even with this expense added, there is a large saving over the old method.

In connection with repair work the opportunities for using pneumatic appliances are almost without number, for it is in this class of work particularly that it is often desirable to take the tool to the part to be repaired instead of taking the part to the shop. The greatest savings effected with portable pneumatic tools often pertain to the avoidance of costly delays incident to some minor part giving way and affecting the operation of important machinery.

In addition to the applications outlined, pneumatic drills are used for grinding and reseating valves, for reboring cylinders and for operating large valves and small machines. Chipping hammers are used for quickly cutting out sections of pipes and sheet-metal work and for scaling rust and paint from metal surfaces. The cement gun, the sand-blast machine, pneumatic paint and whitewash spraying machines, pneumatic displacement pumps and air-operated reciprocating pumps are other devices of the greatest value in repair and construction work.

Many of the appliances mentioned also find everyday application about the shop and power plant. A few of these applications may be enumerated as follows: Setting locomotive valves; expanding boiler tubes and flues; cleaning scale from boiler tubes with the aid of pneumatic drill motors; beading tubes and calking sheet metal with chipping hammers; drilling anchor-bolt holes in concrete machinery foundations; blowing out the air spaces of electric motors, the flues of boilers and other inaccessible places by means of an air jet. Compressed air is also commonly used for testing the tightness of pipe lines. Air from a stationary compressor is not available in some of the smaller plants, and in such cases a portable unit might be used to advantage.

Having defined the field of the portable compressor in general, the various types will now be described briefly.

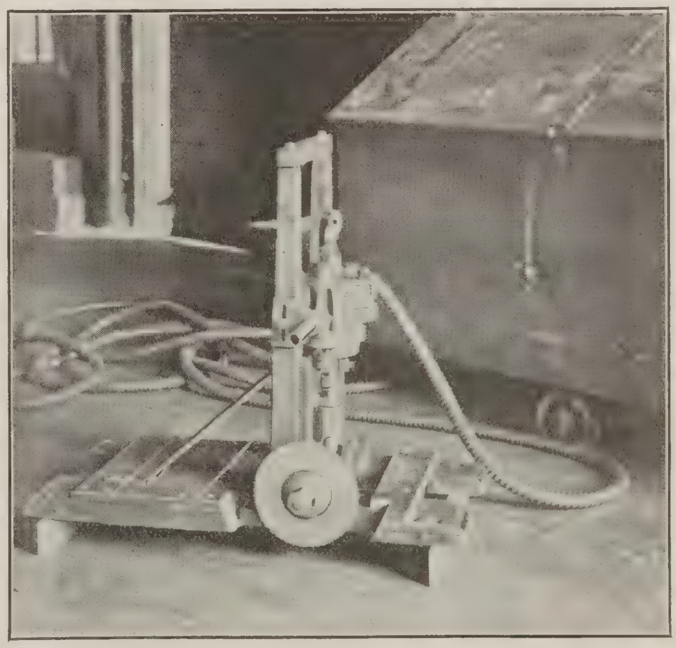

FIG. 5. PORTABLE SAW FOR CUTTING OUT OLD ROOFING OR FLOORING

The mine car compressor is the most suitable type for underground operations. During the past few months it has been adopted extensively for operating hand drills, mounted cutting machines, punchers, pneumatic tools, etc. After a brief try-out that demonstrated beyond doubt their economy, one Pennsylvania coal mine purchased 14 of these outfits, and many other mines in various parts of the country are starting to use them.

This equipment is a self-contained, self-lubricating, electrically operated unit, totally inclosed as a protection against the entry of dirt to the working parts. It can be started up by the miner and will run without further attention while he is drilling the coal or rock, excepting occasional replenishment of water in the reservoir cooling jacket surrounding the compressor cylinder. It may be quickly and easily moved over the regular mine tracks to any part of a mine and can be set up and connected with the regular mine power wires in a short space of time. This type of compressor is made in capacities ranging from 78 to 415 cu.ft. of free air per minute.

The mine car compressor is equally suitable for use above ground provided the work is situated within a few hundred feet of the tracks over which it runs. Fig. 6 illustrates a type that is perhaps better suited for general conditions above ground, as it can be transported by horse or other power to almost any location. The entire outfit is mounted on a covered truck. It is built in various capacities ranging up to 464 cu.ft. of free air per minute.

The cost for power of such an equipment is less than would be expected. Consider the case of a motor-driven compressor of 145 cu.ft. displacement. This would require a motor with a horsepower input of about 25 for 70 lb. air pressure. Three cents per electrical horsepower per hour is undoubtedly a liberal allowance for power in coal-mining regions. Interest, depreciation and repairs figured at 25 per cent. of the initial investment of such an equipment would amount to about $200 per year—a liberal estimate. Based on 300 working days per year, one shift per day, this figure would reduce to about 67c. per shift.

Supposing the work under consideration is the digging of a wide ditch through rock, employing two hand drills for an 8-hr. shift, the cost would figure about as follows per shift:

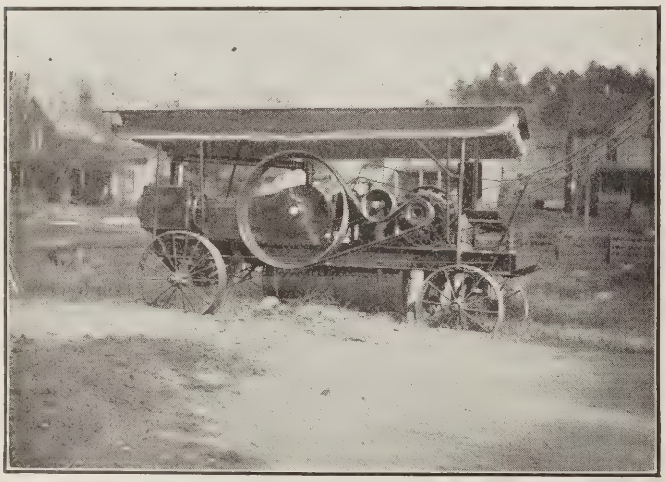

FIG. 6. PORTABLE ELECTRICALLY DRIVEN COMPRESSOR

Operator	$4.00
Two drill runners at $2.50	5.00
Lubricating oil	.50
Cost of power for air, 25 hp. for 8 hr. at 3c. per hp.	6.00
Interest, depreciation and repairs	.67
Total per 8-hr. shift	$16.17

No reduction is made in power charge for unloaded periods, which would undoubtedly reduce this charge considerably.

The footage accomplished with a Jackhamer drill is usually between 100 and 200 ft. of hole per day, depending upon conditions. We shall assume 150 ft. as an average accomplishment. The two machines would therefore drill 300 ft. per day. Thus the cost per foot of hole drilled would amount to $0.0539.

Under similar conditions the two drillers could put in by hand not over 20 or 30 ft. of hole per shift employing the "single-jack" method. Assuming the same rate of wages and an average accomplishment by hand of 25 ft. per 8-hr. shift, the labor cost would be $5 for the two men, and the cost per foot of hole 20c.; in other words, machine drilling with the portable compressor, including all charges, would result in a saving of $0.1461 per ft.; that is, a saving of about 75 per cent. The cost of sharpening steel has not been included in the foregoing estimate as it would be about the same per foot in each case.

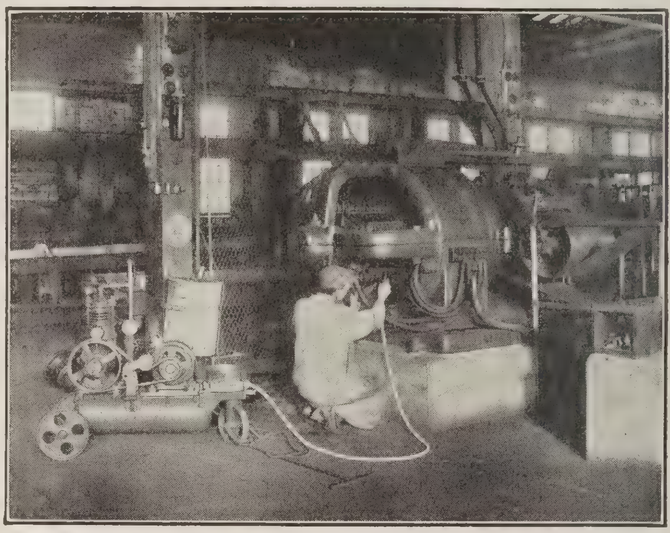

FIG. 7. CONVENIENT TYPE OF PORTABLE SHOP COMPRESSOR

If space permitted, similar comparisons could be worked out for other operations, showing the remarkable savings effected by employing compressed air supplied by a portable plant.

Fig. 7 shows a convenient type of portable compressor for use in shops, power plants and other places where a small amount of compressed air is required. The compressor proper is an air-cooled Imperial type XII vertical machine having a capacity of 6-cu.ft. displacement. A type of short belt drive similar to that used on larger machines is used to connect motor and compressor. The air receiver forms the body of the truck, and on it are mounted compressor, motor and all accessories, including a 20-ft. coil of air hose, plug and switch, wire, etc.

⁂

The Presence in Mine Gas of Ethane, propane and butane has been held to indicate that such gas did not wholly arise from the coal, but was partly or wholly from gas wells in the vicinity. However, if mine air does not contain these gases their absence does not prove that the atmosphere of the mine is necessarily free of admixture with gas from wells, because it has been found by the United States Bureau of Mines that out of 25 samples of natural gas from cities five were free of such hydrocarbons, among which cities were Texarkana, Ark.; Lewis and Mansfield, La.; Nowata, Okla.; and Corsicana, Tex. Some natural gas has as much as 20 per cent. of ethane, like that supplied to Louisville, Ky. It appears from the investigations of G. A. Burrell and G. G. Oberfell that the gas in one stratum may be free of ethane and that another below it may have as much as 5 per cent.

Mine Telephone Equipment

By Walter C. Freeman

SYNOPSIS—A detailed discussion of various telephone systems, with practical suggestions concerning the selection of a type suitable for coal-mine service. Metallic circuits are recommended in preference to ground-return circuits. Remarks concerning supporting and insulating the wires.

The many advantages and economies accruing from the installation of telephone systems in mines have been reviewed in the columns of mining periodicals at various times, but little space has been devoted to the discussion of equipment and its arrangement to give the most efficient operation. It is the purpose of this article to describe the operating features of the systems and apparatus most commonly used, also to offer some pertinent suggestions of practical value regarding installation of the equipment.

Telephone systems in general are classified into two main groups; namely, the "common battery" system and the "local battery" system. Each has its particular advantages for the class of service for which it was designed, though the speech-transmitting efficiencies under the same operating conditions are nearly equal in value. The main point of difference between the two systems is the method of supplying electrical energy to the telephone instruments.

In common battery operation, as the name implies, the current for all of the telephones in the system is supplied by one main battery, usually of the storage type, at a potential of approximately 20 volts. This battery not only furnishes the current for talking purposes, but for the operation of the various switchboard signaling devices as well.

It will be readily understood that this method of power supply is objectionable for mining service because any interruption of the current would totally disable the system. In addition to this serious drawback, the common battery system does not provide a means of signaling between any two telephones without the interposition of a switchboard and the assistance of the switchboard operator in establishing a connection. Furthermore this system when installed to meet the service requirements of mines of average size does not compare favorably with the local-battery system in the factors of first cost, maintenance and operating expense. For these reasons the common battery is seldom recommended or used for service underground and will be eliminated from further discussion herein.

The Local-Battery System

The telephones used with the local-battery system are equipped and wired to consume current for talking purposes, furnished by either two or three cells of dry battery which are placed within the housing of each telephone set. The alternating current which is required for ringing other telephones on the same line and also for signaling the switchboard in large systems is generated by a hand generator, which likewise is included in the equipment of each instrument. Under this arrangement it will be noted that each telephone is independent of an outside source of power, and consequently may be used either for systems comprising but two telephones or for larger systems with many instruments connected.

The local-battery system, when the electrical properties of the various pieces of apparatus in the telephones are properly proportioned, is quite flexible. Any number of telephones up to 15 may be connected in multiple to one pair of wires so that each telephone station may call and talk with any other on the same circuit without the aid of a switchboard and operator's service. The signaling between the various stations is accomplished by means of a system of code rings which are sounded upon all telephones simultaneously; therefore the number of telephones per line should be limited to about 15 so that the ringing code will not become unduly complex and difficult to transmit correctly. It is possible to operate as many as 40 instruments on a line, but the continual ringing of the bells and the complex code of signals would be distracting.

In mines where a greater number of telephones are required, the telephones are separated into groups of convenient number served by one line. The several lines are brought to the surface and centralized upon a switchboard so that a connection may be established between any two telephones in different groups. This connection to the switchboard does not affect the ability of any station to independently call and converse directly with any other telephones connected to the same line. An injury to a telephone or an open circuit in any section of the line wire will not in the majority of cases interfere with the operation of the rest of the system as a separate unit. The local-battery system is simple to install and maintain and in addition is generally less expensive in first cost and annual charges than the common-battery system.

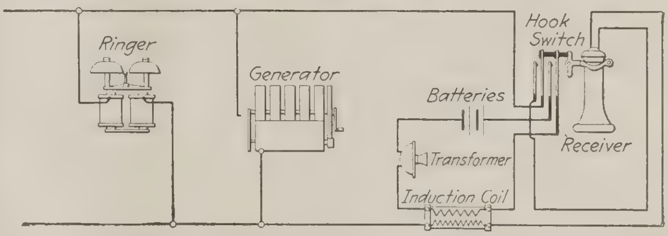

FIG. 1. ESSENTIAL PARTS OF A MINE TELEPHONE AND CIRCUIT CONNECTIONS

The three principal elements of a mine-telephone system are the telephone sets, the line construction and the switchboard. The electrical properties of telephones intended for mining service are largely the same as for local-battery telephones used in the smaller towns and villages, but the mechanical construction of mine telephones is quite different owing to the severe hazards to which telephones are exposed underground.

Mine Telephones Should be of Rugged Construction

In mining service the instruments are frequently exposed to mechanical injuries such as falls of rock and ore, rough handling by careless workmen, concussion of blasting and other conditions that will suggest themselves to the reader. Besides these hazards there are many localities in which the telephones are subject to excessive moisture and the corrosive action of acid mine waters and gases. These conditions have been taken into consideration by telephone manufacturers who have developed and now sell telephones designed especially for service in mines.

In order to thoroughly understand how the instruments operate let us consider Fig. 1, which diagrammatically shows the essential parts of a mine telephone and the circuit connections. This circuit arrangement is known to telephone men as a "bridging" telephone circuit because of the position of the polarized ringer and the hand generator, which are connected in multiple to or bridged across the line wires. In this circuit the ringer operates whenever the alternating ringing current traverses the line. The hand generator is equipped with an automatic circuit closer so that it is connected in the circuit only when the crank is turned while calling another telephone station. The object of this switch is to remove the low resistance path through the generator armature which would seriously impair the ringing and talking qualities of the circuit. The permanent connection of the ringers is necessary for the reception of the signals and does not reduce the talking efficiency to any appreciable extent, because the coils have a total resistance of 1,000 ohms or over and a high choking effect toward the passage of the voice currents via the ringers.

The talking circuit includes the transmitter, induction coil, receiver and the hook switch. The latter piece of apparatus is operated by taking the receiver from between the jaws of the hook. In some telephones the hook switch is controlled by the weight of the receiver and is operated by the upward thrust of a spring when the receiver is lifted from the hook. The hook switch in its operated position closes two pairs of contacts. One pair closes the circuit from one line terminal through the receiver and secondary winding of the induction coil back to the other line terminal. The other pair of contacts controls the battery supply and closes a circuit including the transmitter, the primary winding of the induction coil and the battery.

How the Voice Is Transmitted

When the user speaks into the transmitter, the sound waves impinge upon the transmitter diaphragm and impart to it a vibratory motion. The vibrations are carried by means of a small piston to a polished carbon electrode, which is separated from another like electrode by small carbon fragments of uniform size. The electrical resistance between the two electrodes, which are connected to the transmitter terminals, is variable and depends upon the area of contact between the various fragements of carbon and the electrodes. Under the varying degrees of pressure on the piston the resistance of the transmitter is raised or lowered and passes a current of ever-changing value which corresponds in amplitude to the sound waves of the speaker's voice. The undulating current flows in the primary winding of the induction coil, which in reality is a small step-up transformer. It not only steps up the voltage, but also allows the transmitter to operate in a local circuit where it is not affected by the resistance of the line circuit.

When the incoming voice currents are impressed upon the receiving telephone they do not pass through the ringer coils because of their high impedance or choking effect of the windings, but continue on through the secondary winding of the induction coil and the receiver. The receiver contains a U-shaped permanent magnet whose pole extremities are each surrounded by small electromagnet coils which are connected in series. A thin soft iron diaphragm is clamped at right angles to the pole faces of the magnet so as to lie within its magnetic field. The voice currents are alternating in character, and part of each wave augments the field of the permanent magnet through the action of the electromagnet coils and increases the pull on the diaphragm, causing it to further approach the poles of the magnet. Conversely the other and opposite portion of the wave diminishes the tractive effect of the magnet because the current opposes and counteracts a part of the permanent field and allows the diaphragm to recede. The rapid recurrence of this action results in a vibrating movement of the diaphragm which gives motion to the surrounding air and reproduces the sounds spoken into the transmitter at the distance station.

When the receiver is replaced upon the hook, the battery circuit is opened so that no energy will be consumed while the telephone is not in use. The receiver circuit is also opened in order to remove the low resistance path in multiple to the ringers which would seriously impair the operation of the latter apparatus. Some telephones are wired for and equipped with a condenser in the receiver circuit. The electrical properties of this kind of condenser are such that it forms a practical bar to the passage of the alternating current of low frequency used for ringing, but offers little resistance to the high-frequency voice current. This is a valuable device in that it eliminates the ringing trouble frequently experienced on local-battery telephone lines, owing to the failure of the last user to hang up the receiver at the end of a conversation.

Specifying a Telephone Equipment

In ordering equipment for a mine telephone system it is well to specify that the instruments be equipped with ringers wound tc a resistance of about 1,600 ohms. This resistance value is low enough to insure ample current flow in the ringer coils and a clear loud signal, yet high enough to allow the installation of 15 or 20 telephones on one line without unduly overloading the hand generators. The resistance of the ringers in the various telephones connected on the same line should all be equal, otherwise the telephones equipped with low-resistance ringers will consume the greater share of the ringing current and cause the ringers wound higher to ring weakly, if at all.

The local operating conditions and service requirements in mines are so varied that it is impracticable to attempt to recommend any standard practice covering the number and locations of the telephones. In some states laws have been passed to govern the minimum number of instruments to be employed and the places where they must be used. In laying out a system it would be well to consult the state mining laws to see that these regulations are observed and provision made for as many additional stations as good service and economy demand. It is the usual practice to install one telephone within convenient distance of each group of miners so that reports and orders may be quickly and easily transmitted.

Fig. 2 shows a portion of the plan of a mine and the locations of the instruments. In this diagram the squares represent the telephones and the circles the loud-ringing extension bells connected by temporary wiring to each telephone. The telephones are located in the main passageways so as to take advantage of favorable air currents for carrying the sound of the gongs in the proper direction as far as possible. The extension bells are used to avoid the necessity of moving the telephones as the work advances and so that the signals will be heard clearly above the noise of running machinery.

Although local-battery mine telephones will operate on a circuit consisting of one wire and the earth for the so-called return, it is the best practice to employ a full metallic circuit consisting of two wires connecting all instruments. Ground-return circuits are objectionable in that they are extremely liable to become noisy owing to foreign currents, especially in mines where electricity is used for haulage and the operation of drills and cutters. Furthermore the ground connection is in many cases difficult to perfect and there is liability of "cross-talk" or interference between simultaneous conversations on separate lines of this kind.

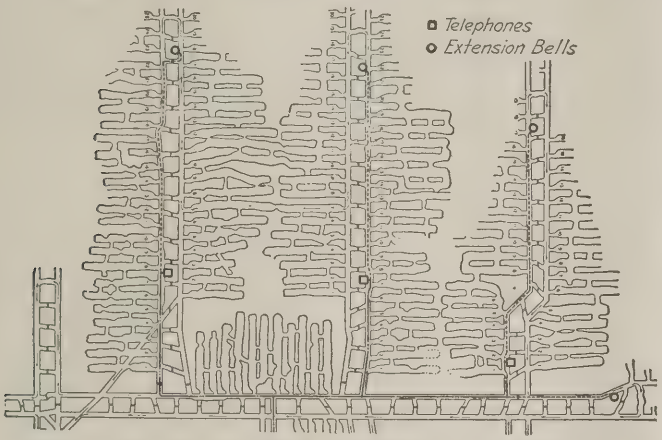

FIG. 2. PLAN OF MINE, SHOWING LOCATION OF INSTRUMENTS

The Most Satisfactory Type of Circuit

The metallic circuit is more expensive to install owing to the additional amounts of material and labor, but this difference is offset by the gain in reliability and efficiency. The kind of line wire to be used is a matter of choice, depending upon the local conditions. Iron, copper and copper-clad steel are the conductors generally used, and in all cases these wires should have a heavy insulation and a substantial weatherproof exterior braid. No. 12 B.w.g. iron wire insulated in the manner described is entirely satisfactory for mine systems as to electrical properties and mechanical strength, but should be used only in dry mines. In localities where there is much seepage, especially of waters having an acid reaction, lead-covered and rubber-insulated twin copper wire should be employed. Insulated copper-clad steel wire of the No. 14 B. & S. gage has been used to some extent in place of iron wire with good results. This wire has the tensile strength of steel and a conductivity about 40 per cent. of that of pure copper wire of the same diameter.

The wires should be supported much in the same manner as electric light and signal wires, on either porcelain knobs or glass insulators fastened to the roof timbering. The same precautions for insulating electric light circuits should also be observed in the construction of telephone lines. The clearance between the telephone lines and such circuits should be kept at the maximum distance to avoid accidental contact and to reduce the electromagnetic induction between the two systems. In some places where lighting and power circuits parallel the telephone lines for a considerable distance, the foreign currents caused by induction make the telephone lines so noisy that conversation is nearly impossible. To diminish this interference it is necessary to use either twisted-pair telephone wires on such parallel runs or to transpose the two wires of the telephone circuit at frequent intervals. Either method exposes each wire of the pair equally to the disturbing influence and balances the circuit so that the induced currents in each tend to neutralize. Under this condition there is no flow of induced current; therefore no extraneous noise is heard in the telephones.

All splices should be made with wire connectors or else well soldered without the aid of acid soldering pastes or compounds. Bad splices are intermittent sources of trouble and are extremely hard to locate. Where wires pass under or over pipes or through holes liable to abrade the insulation they should be covered with "circular loom," "flexduct" or porcelain tubes.

As before stated it is necessary to use a switchboard for connecting the various lines when the number of telephones installed does not permit the connection of all instruments to one circuit.

One switchboard scheme used by a West Virginia mining company appealed to me as an ideal equipment for a small system. The company in question used a small switchboard and had it equipped with a small double-pole double-throw switch in connection with each of the ten line equipments installed therein. The purpose of these switches was to disconnect the lines from the switchboard and to connect them to a pair of bus wires at night so that any telephone might call any other without the necessity of keeping the operator on duty when the volume of traffic was light. As each line carried but three telephones, each station could easily signal any one of the remaining 29 stations. This instance is cited to show that, with a little study, telephone systems can be worked out so as to give maximum convenience and economy.

Coal Fields of Indiana

By Frank I. Pearce*

The productive coal area of Indiana is located in the southwestern part of the state and constitutes the eastern edge of what is known as the eastern interior coal region. The area occupied by "coal measures" embraces about 6,500 sq.mi. To say, however, that the coal fields of Indiana cover so large a territory does not mean that coal beds of a minable character are to be found everywhere under this area.

There are large portions within the general field where, although the rocks are of carboniferous age, no local seams whatever are to be found. There are other areas of large size which contain coal, but are lacking in workable seams. To say, therefore, that Indiana has or did have 6500 sq.mi. of coal lands is an entirely erroneous statement. There are within the state of Indiana 15 or more seams of coal varying in thickness from a black mark to strata which in some places are 10 ft. thick.

The Lateral, or Side, Friction of Hoisting Ropes

SYNOPSIS—Formulas connecting the length of the hoist, the distance from sheave to hoist drum, the ratio of rope diameter to that of the drum, and the angle made by the rope in its central and extreme positions are proposed.

The side, or lateral, friction of winding ropes was the subject of a paper presented by H. W. G. Holbaum at a meeting a few months ago of the North of England Institute of Mining and Mechanical Engineers. He said therein that practical men are inquiring for a simple formula connecting the various factors which determine the amount of lateral friction encountered by a winding or hoisting rope as it travels from one side of the drum to the other.

His object was to submit such a formula and to initiate a discussion leading possibly to the solution of the problem. It had been solved by the Koepe system, but a satisfactory solution for the case of the ordinary wide drum has yet to be found.

An Equation for Side Wear

Let A equal the angle of maximum friction in degrees. When a rope between the pulley and the drum lies in the same vertical plane as that of the pulley, there is no lateral friction. In practice the angle of maximum friction will probably be found to be not less than 1 deg. and not more than 3 deg. The purely numerical value of A therefore ranges from 1 to 3. Then the ropes being central on the drum at meetings of the cages.

$$A = \frac{10\,H}{R\,L} \qquad (1)$$

Where

H = Length of cage travel from receiving to discharge position;

L = Length of the rope extending from the sheave to the drum;

R = Ratio of the drum diameter to the normal diameter of the rope.

This ratio is from 110 to 150 in English practice. H and L may be taken in any units, but both must be in similar units. If it be deemed expedient that A shall not exceed a given predetermined numerical value, the winding engine must either be placed at such a distance from the pit that

$$L = \frac{10\,H}{A\,R} \qquad (2)$$

or the drum must be of such a diameter that

$$R = \frac{10\,H}{A\,L} \qquad (3)$$

That is to say, if D = drum diameter and d = rope diameter, both stated in similar units, the following formula must be taken:

$$D = d \times \frac{10\,H}{A\,L} \qquad (4)$$

If the width of drum required for each rope is W, then

$$\left.\begin{array}{l} W = x + \dfrac{7\,H}{20\,R} \\ \text{or} \\ W = x + \dfrac{7\,A\,L}{200} \end{array}\right\} \qquad (5)$$

where x = the additional width required to accommodate the two or three holding coils of rope that remain on the drum when the cage is at the pit bottom. In (5), W, x, and A (or L) must all be taken in the same units (feet, inches, etc.).

Some Quantities Are Fixed

It will be seen by (1) that since H cannot be altered for a given mine, A can be reduced only by increasing L or R or both. There is a practical limit to the permissible value of L, since most managers prefer that the engineman shall have a clear view of the dumping operations of the cages. Probably L may legitimately be extended to be 50 yd., in which case any reasonable value of R will reduce the angle A of maximum friction to about 1½ deg., always provided that the ropes are so adjusted as to center themselves at cage meetings, or midtravel. The lateral friction should be quite a negligible quantity in the case of the shallower mines.

The value of R may be increased in either or both of two ways—the diameter of the drum may be increased or that of the rope may be reduced. Mr. Holbaum believes that as the problem of electric hoisting approaches more closely to its complete solution the present necessary connection of the bigger engine with the bigger drum will disappear, owing to the already proved superiority which electrical systems possess in the matter of elasticity. He summarized as follows:

1. Other things being equal, the lateral, or side, friction will be at a minimum if the rope assumes a position in the center line of the drum at midwind.
2. Other things being equal, the lateral friction varies inversely as the distance L intervening between the sheave and the drum.
3. Other things being equal, the lateral friction varies inversely as the ratio R which the diameter of the drum bears to the diameter of the rope. The magnitude of the ratio R may be augmented, not only by increasing the diameter of the drum, but also by decreasing the diameter of the rope—that is, by using only the best material—so that a smaller diameter of rope may suffice for a given load.
4. Other things being equal, the lateral friction varies as the square of the angle A.
5. Other things being equal, the destructive character of the lateral friction varies with the roughness of the rope; hence, ropes of the flattened-strand and locked-coil types suffer less than ropes of the ordinary type because their surfaces are smoother.
6. It is also obvious that the lateral friction in any given case will be much less if the rope is kept thoroughly lubricated than it can possibly be if this point is even partly neglected.

Importance of the Welsh Coal Fields

The importance of Cardiff and of the South Wales coal field as the sole source of supply of fuel for the British Navy and for most of the French ships has attracted such attention to the district that some particulars about the field may be of interest, says Consul Lorin Lathrop in *Commerce Reports*.

The Welsh coal field has a superficial area of 1,000 square miles. There are 700 mines in operation, and the number of employees above and below ground is nearly 250,000. The product ranges from bituminous to anthracite and includes the Cardiff smokeless steam coal, accepted in Europe as indispensable for naval vessels. The classification of the coals of the field is as follows:

(1) Bituminous—House, gas, coking, and manufacturing coals.

(2) Steam and anthracite—Coal for steam raising, malting, lime burning, gas power, hop drying, etc.

(3) Semibituminous, or second-class steam—Coal applicable for stationary engines and bunkering of steam vessels.

(4) First-class steam—Coal in seams from which Admiralty is supplied, and coals of similar quality.

COAL AT A DEPTH OF MORE THAN ONE MILE

The quantity unworked in best steam coal seams 1 ft. thick and upward in the collieries on the Admiralty list is estimated to be in excess of 3,000,000,000 tons, of which two-thirds is in seams of 2 ft. and over. The field is expected to yield in the future over 8,000,000,000 tons of bituminous, 6,000,000,000 tons of anthracite and nearly as much of the semibituminous, or second-class steam coal, and 4,000,000,000 tons of free-burning steam coal in the western division. The greatest estimated depth at which the coal lies is 6,050 ft. The coal is stated to be the most costly in the world to raise. Owing to the geological and labor conditions the output per man employed is the lowest in any great field of the world, being about 230 tons per annum. The mining valleys are intersected with a network of railways that connect with the trunk lines of England, and also with the ports on the south from Newport, Monmouthshire, on the east, to Llanelly on the west.

Cardiff is the main outlet for the field and is the leading coal-shipping port of the world. The annual shipments exceed 25,000,000 tons, and always represent approximately half the production of the district. The yield for 1914 is considered to have exceeded 52,000,000 tons, a record year with the exception of 1913, when the output exceeded 56,000,000 tons. Of the total output, 10,000,000 to 12,000,000 tons is of the quality known as best Admiralty coals. Since the beginning of the war the exportation of this grade has been prohibited.

EXPORTS OF COAL, COKE AND PATENT FUEL

Exports of coal, coke and patent fuel from the United Kingdom for the first seven months of 1914 amounted to 43,000,000 tons, a falling off as compared with the corresponding period of the great boom year of 1913 of 1,257,000 tons. For the five war months shipments were 18,860,000 tons compared with 32,360,000 tons for the last five months of 1913. The total foreign and colonial shipments from the United Kingdom in 1914 were 61,680,000 tons compared with 76,700,000 tons in 1913. The average value per ton f.o.b. was $3.30 in 1914, against $3.40 in 1913. Shipments from the United Kingdom to France were hardly reduced by war conditions; they exceeded 12,000,000 tons in both 1913 and 1914. Exports to Italy were reduced by 1,000,000 tons, and to Spain and Egypt by more than 500,000 tons each. Exports to Brazil fell from 1,900,000 tons in 1913 to 1,200,000 tons in 1914; and to Argentina, from 3,700,000 to 2,900,000 tons.

EXPORTS WERE 16,000,000 TONS

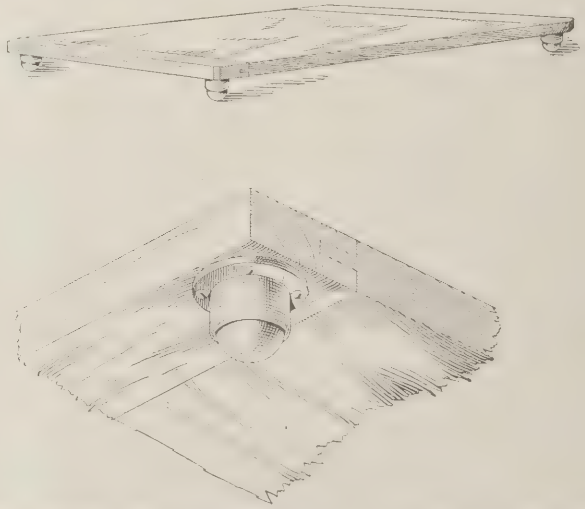
Foreign shipments from Cardiff in 1914 amounted to 16,000,000 tons, as against 19,300,000 tons in 1913. In addition to the 1914 figures given, supplies were sent to the fleet of which no estimate can be given. Coastwise shipments were figured at 2,000,000 tons, a falling off of 800,000 tons; for foreign bunkers, 2,900,000 tons; for coastwise bunkers, 100,000 tons. These figures representing the coal trade of Cardiff for 1914 total 21,000,000 tons; the coal trade of Newport was 5,600,000 tons.

The following table shows the range of prices of coals in 1914 per ton of 2240 lb. f.o.b. Cardiff or Newport:

Kinds	Jan. 1	Highest During Year	Lowest During Year	Dec. 1
Best Admiralties	$4.98	$5.34	$4.37	$5.04
Best seconds	4.68	4.98	4.25	4.74
Seconds	4.56	4.74	4.13	4.56
Best smalls	2.73	3.04	1.76	3.10
Cargo smalls	1.88	2.43	1.39	2.43
Monmouth black veins	4.43	4.56	4.01	4.43
Western valleys	4.25	4.43	3.89	4.31
Best house (at pit)	4.86	4.86	4.80	4.80
No. 2 Rhondda	3.58	3.64	3.10	3.64
Patent fuel	5.10	5.10	4.01	4.31
Foundry coke	6.07	6.07	5.34	6.07

Ball-Bearing Drawing Board for Freehand Work

In making freehand drawings the board must be turned and shifted frequently to accommodate the hand to different curves and lines. Every time the change in position is effected the fingers must be deftly inserted between the board and the table. I provided my board with four ball casters, as sketched, to facilitate this turning and shifting. The casters are a standard article readily bought anywhere. I found this board very valuable for freehand work.—E. Schwartz, Brooklyn, N. Y.



TWO VIEWS OF DRAWING BOARD, SHOWING HOW THE CASTERS ARE FITTED ON

Meeting of Rocky Mountain Coal Mining Institute

The fourth regular meeting of the Rocky Mountain Coal Mining Institute, with 42 members in attendance, was called to order Monday morning, Nov. 29, 1915, by President E. H. Weitzel, who delivered a short address.

Governor George A. Carlson of Colorado then welcomed the members on behalf of the State of Colorado. This was followed by an address of welcome by Mayor W. H. Sharpley on behalf of the City of Denver.

The minutes of the previous meeting held at Trinidad, Colo., June 8, 9 and 10, 1915, were read by the secretary. There being no corrections or alterations, they were approved as read.

An amendment was proposed by R. C. Hills to article 3 of the constitution, adding thereto, "and a publication committee consisting of three, including the secretary as an ex-officio member," so that the article will read: "The officers of this institute shall consist of a president; four vice-presidents, one to be elected from each state in which the institute operates; a secretary-treasurer; an executive board of 13 members, consisting of the president, the four vice-presidents and two other members from each state in which the institute operates, and a publication committee consisting of three, including the secretary as an ex-officio member."

Section 6 to be added to article 9, "Duties of Officers," will read: "It shall be the duty of the publication committee to receive and edit the papers to be read and issue with the notification circular a brief synopsis of each paper for the purpose of promoting discussion thereon; to arrange all copy for publication; read all proof, and assist in the distribution of the semiannual transactions."

The amendment was read and laid over until the next regular meeting for a vote.

The meeting then proceeded with the nomination of officers for the ensuing year. The president appointed a nominating committee consisting of Benedict Shubart, G. A. Kaseman, A. C. Watts and M. B. Urquhart. For the office of president the committee selected the names of E. H. Weitzel, W. J. Murray and John McNiel. A. C. Watts was nominated from the floor.

A ballot was then taken, and A. C. Watts having the majority of the votes cast, was declared elected and immediately assumed his duties of office.

The nominating committee then reported their selection of the following names: J. C. Roberts, Golden, vice-president for Colorado; F. R. Weitzel, Dawson, vice-president for New Mexico; A. H. Cowie, Salt Lake City, vice-president for Utah; W. D. Brennan, Cheyenne, vice-president for Wyoming; F. W. Whiteside, secretary-treasurer, Denver.

The names proposed for the executive boards of the following states were: Colorado, S. Dean, of Delagua, and W. C. Ferguson, of Denver; New Mexico, G. A. Kaseman, of Albuquerque, and F. A. Young, of Raton; Utah, E. L. Carpenter and G. A. Murphy, of Salt Lake City; Wyoming, William Monay, of Kemmerer, and Peter Kooi, of Kooi.

There being no contest for any of the offices, the secretary was instructed to cast the ballot for each of the names, and they were severally declared elected.

A vote of thanks was extended to E. H. Weitzel and Frederick W. Whiteside for their services to the institute during their respective terms of office. A vote of thanks was also extended to all retiring officers.

The president was authorized to appoint a jewel committee to select a token of appreciation for the retiring president. The following were appointed: Messrs. Urquhart, Kaseman, McGraw and McGowan.

Motion was duly made, seconded and carried that it be the sense of the institute that the elaborate entertainments of the past be discontinued at the regular meetings in the future, that no free entertainments be accepted by the institute and that each member pay his own expenses. The executive committee was appointed to suggest at the next meeting a suitable emblem for the institute.

Benedict Shubert was requested by the chair to read a paper prepared by John Bevan, of Colorado Springs, who was absent, the subject being "Colliery Explosions." There being no further business the morning session adjourned.

The meeting was again called to order at 2 : 30 p.m., with President A. C. Watts in the chair.

A paper was read by Mr. Watts, the subject being, "Features of Coal Mining in Utah, Principally in Carbon City." This was followed by a discussion.

At 8 : 15 p.m. the members and friends of the institute attended the Denham theater, where the production, "Under Cover," was presented in a highly creditable manner by the Denham Players.

At 10 a.m. on Nov. 30 the meeting was called to order by President Watts. A vote of thanks was extended to the committees on arrangement and entertainment for their efficient services in making preparations for the present meeting.

The secretary was instructed to extend a written vote of thanks to the management of the Albany Hotel for the use of the convention hall and for the many courtesies extended.

The following candidates having been regularly proposed, were balloted upon and declared elected: A. A. Young, John Murrell, William B. Phillips, William R. Chedsey, J. B. McKennan, Arthur V. Lindee, J. J. Thomas, David Williams, Ernest Curran, Morgan T. Townsend, Fred Carroll, Harry Wolf, Frank Dayton, Walter Macpherson, John McNeil, Jr.

A paper was next presented by Dr. William B. Phillips, the subject being, "Coal Resources of the West." This was followed by a long and interesting discussion.

On motion duly made, seconded and carried, it was

Resolved, That individually and collectively the institute lend its support to the School of Mines of Colorado and institutions along similar lines in our three neighboring states in which our institute operates toward the promotion of coal-mining activities and the establishment of a chair of coal-mining engineering.

Mr. Martin Maurer then presented a paper on "Tipple Scales." There being no further business the meeting adjourned.

At 1 : 30 p.m. members and friends of the institute left for a trip through Denver's Mountain Parks, stopping on the return at the gymnasium of the School of Mines, at Golden, where an enjoyable reception was held and refreshments served, after which the members were shown over the grounds and through the various buildings of the institution.

At 8 p.m. members and friends of the institute attended the Colorado Electric Show being held at the Auditorium.

Abuse of Blasting Fuse

Many miners, acting in good faith and recognizing the waterproofing quality of axle grease or crude oil, apply these lubricants to the outside of capped fuse so as to make a waterproof joint, but by so doing they only start trouble for themselves. Grease and oil are solvents of the fuse varnishes, and when they penetrate the outer covering they destroy the powder train in the fuse with as great, if not greater, rapidity than would the water that the miner is trying to exclude.

When preparing fuse for use, it is common practice to coil it around the arm as one would a clothesline. This is bad practice because kinks are liable to occur to break the powder train. When cutting off the fuse care should be exercised to cut it square across and not obliquely, for the latter method will leave a sharp point at the end of the fuse—not a particularly safe thing to jab into a blasting cap. Furthermore, if the point happens to be soft, as it is likely to be in warm weather, it will bend over or curl up and so will be liable to cause a misfire. Misfires are more likely to be due to lack of care on the part of the miner making up the primers than to fault in the fuse itself.

When making up primers, do not hesitate to cut an inch of fuse from the end of the coil. By doing this the damp end is cut off and is not put into the detonating cap. Fuse that has been hammered or injured by falling ground, or damaged from any other source, should never be used. Any change in the covering of the fuse will either increase the burning rate or have the opposite effect and cause a misfire.—*Engineering and Mining Journal.*

Anthracite 2,458,125 Tons Short

The total shipments of anthracite, as reported to the Anthracite Bureau of Information, for eleven months of this year were 2,458,125 tons less than for the corresponding months of 1914. Shipments of anthracite last month were 6,297,215 tons as against 5,928,286 tons in November, 1914, an increase of 368,929 tons. This establishes a new record for November. The largest previous shipments for this month were in 1911, when 6,193,314 tons were sent to market.

The amount of coal on hand at tidewater decreased 15,160 tons, from 625,821 tons on Oct. 31 to 610,661 tons on Nov. 30. The decrease in the amount of coal at tidewater has been going on steadily for the last three months and indicates that the stocks at tidewater are being drawn upon to make up for the slow sales last summer when the public failed to take advantage of the usual discounts.

The Lehigh Valley led in tonnage for the month with 1,190,103 tons; the Philadelphia & Reading was second with 1,163,851 tons; and the Delaware, Lackawanna & Western was third with 971,389 tons. The Jersey Central carried 762,140 tons, the Erie 696,890 tons, the Delaware & Hudson 694,386 tons, the Pennsylvania 616,190 tons and the New York, Ontario & Western 202,266 tons.

Extracts from a Superintendent's Diary

Tomorrow our camp will have its first community Christmas. The tree has been erected, the presents have been carefully assembled in our commissary wareroom, and the kids of our community have all been properly tipped off as to the possibilities of the morrow.

Every firtree standing within a radius of ten miles of camp has been inspected several times during the past week, and the one finally selected for the great occasion had to be admired and passed on by the entire committee before our timberman was allowed to cut it down.

Many were the plans proposed for the raising of the necessary funds to meet the expenses of the celebration, and in the end no single plan was adopted, but each one was instructed to consider himself a committee of one to carry out any one of the suggestions made and to remain as a committee until some money was obtained. The results were truly startling; enough money was collected to provide a suitable tree for a good-sized city. After buying all of the presents that we thought might be needed, we had enough left to enable us to hire a band

Ballads of a Coal Miner--X

Written expressly for Coal Age

Progress

By Berton Braley

WE'VE *got a new manager now*
Who's doin' things proper an' right,
For he's cleanin' up fine around tipple an' mine
Which was once an offense to the sight;
He's tearin' down dingy old shacks
An' buildin' new houses instead,
Where the walls ain't a sieve an' a feller can live
With a decent roof over his head.

WE'VE *got a new manager now*
Who's holdin' down tailin's an' dust,
An' is givin' a show for a garden to grow
Which used to give up in disgust;
He's bringin' us water an' walks
An' roadways that's decently wide,
An' he'll change this in time from a town that's a lime
To a fairly good place to reside.

I HAD *just about made up my mind*
That it wouldn't be fair to a dame
To talk wedded bliss in a dust heap like this,
But now it don't seem quite the same;
For in place of the shacks there is homes,
An' that makes a diff'rence somehow,
An' I guess we'll get hitched now conditions is switched,
For we've got a new manager now.

of 12 pieces for the entire day and also a caterer who will serve hot chocolate and wafers to all who come out to see what a community Christmas can be.

The committee intrusted with the responsibility of selecting the presents had the most strenuous time, and once or twice it looked as if they would have to agree to disagree. It was composed mostly of ladies, and, womanlike, they wanted everything to be suggestive of the spirit of Christmas. They are still undecided as to whether they displayed judgment in their selections, and they await tomorrow's events as anxiously as the children.

We have men of many different nationalities who have spent Christmas in many corners of the globe, and the celebration that they have planned promises to afford a goodly number of surprises. Several newspaper men have learned of the possibilities and are going to be on hand with their notebooks.

Even our absentee directors heard of our plans and requested permission to have a hand in the affair. They were allowed to send contributions of money, and the way they responded made some of our citizens who have been in the habit of saying unkind things about them feel pretty small. Already both parties to the misunderstanding have undoubtedly been repaid for all of the time and effort contributed.

One unlooked-for controversy stirred up by our proposed celebration had to do with the question as to what date should really be considered as Christmas. Since the Slavs were hopelessly in the minority in our camp, they finally agreed to join in the celebration in spite of the fact that they feel sure that we are crazy on dates. Nor were our Slavs the only citizens who had their plans disarranged by the community celebration. We have two German families in our village which for years past have each had a family Christmas tree annually. Year after year most of the families in camp have been given invitations to inspect both of those trees, and the next day, at the request of the exhibitors, a vote had to be taken to decide which one was the most artistic. The rivalry was keen, the tree ornaments were preserved from year to year, and new trinkets were constantly watched for. This year all of those treasured ornaments were turned over to the general committee, and it is doubtful if they can be returned. Truly ours is to be a community tree.

Photographing Mine Maps

By H. A. Williamson*

Hydrochinon (a coal-tar product) is practically the only developer used in the photographic studios of the various engineering departments of the mining and other companies that use the camera to reproduce their various maps. Hydrochinon comes from Germany, normally at a price of \$1.85 to \$2.25 per pound, but at present quoted at \$8 to \$12, with little or none available at any price. Hence these engineer-photographers will probably be glad to try the following formula which does away with hydrochinon:

Water	30 oz.
Potassium carbonate (C.P.)	200 grains (desiccated)*
Sodium sulphite (C.P.)	480 grains (desiccated)*
Potassium bromide (C.P.)	30 grains

*If crystal chemicals are used instead of desiccated, then use 1 oz. of potassium carbonate and 2 oz. sodium sulphite.

Just before use, add 3 grains of dry C.P. pyrogallic acid to each ounce of the solution required, using sufficient of the solution to cover the plate well, say about 16 oz. for an 11x14 plate in a tray 12x15. This 16 oz. should develop three to four 11x14 plates. Development should be complete, and of excellent density in line work, in 4 to 8 min.

After development is complete the plate should be transferred to a bath of water, 30 oz., and citric acid, 60 grains, and allowed to remain for a few minutes. From this bath it should pass to the regular acid fixing bath.

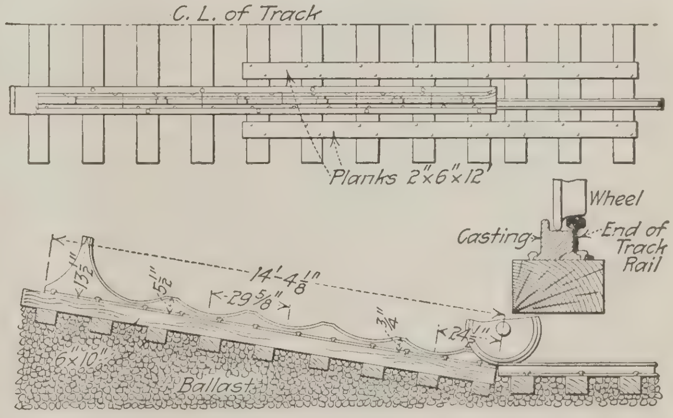
Slightly more contrast can sometimes be secured by adding a small quantity of potassium ferrocyanide to this developer. The temperature of all baths should be 70° F.

At present there is no scarcity of pyrogallic acid, which is quoted in quantity in the eastern market at from \$2 to \$3.25 per pound.

Car Stop of Novel Design for Use in Yard Tracks

A car stop that catches the wheels of cars instead of acting as a bumper has been applied by a number of railways, especially on stub tracks ending at streets or other points where it would be dangerous for a car to overrun the track. In the past a large number of very serious accidents have occurred at just such locations where the ordinary bumper had been installed by the railroad or mining company.

As shown in the drawing, the new bumper consists of two sets of castings forming a 15-ft. continuation of the track rails and having a series of concave depressions to engage the wheels. These castings are placed on 6x10-in. stringers, inclined to give a rise of 24 to 30 in. at the rear end. It would take very high speed to drive a car to the end of this device, and the raised end would then keep it from over running. The depressions are about 29 in. c. to c., with a drop of $3\frac{1}{4}$ in. for the first two and $5\frac{1}{2}$ in. for the others.



DETAILS OF ARRANGEMENT FOR STOPPING RAILROAD CARS

The car wheels ride on their flanges on the car-stop and the brakeshoes and rigging are carried clear of the ridges, as shown in the section in the accompanying drawing.

The device is made by the Saunders Car Stopper and Equipment Co., 113 North 2nd St., St. Louis, Mo. The Southern Railway Supply Co., St. Louis, is sales agent.

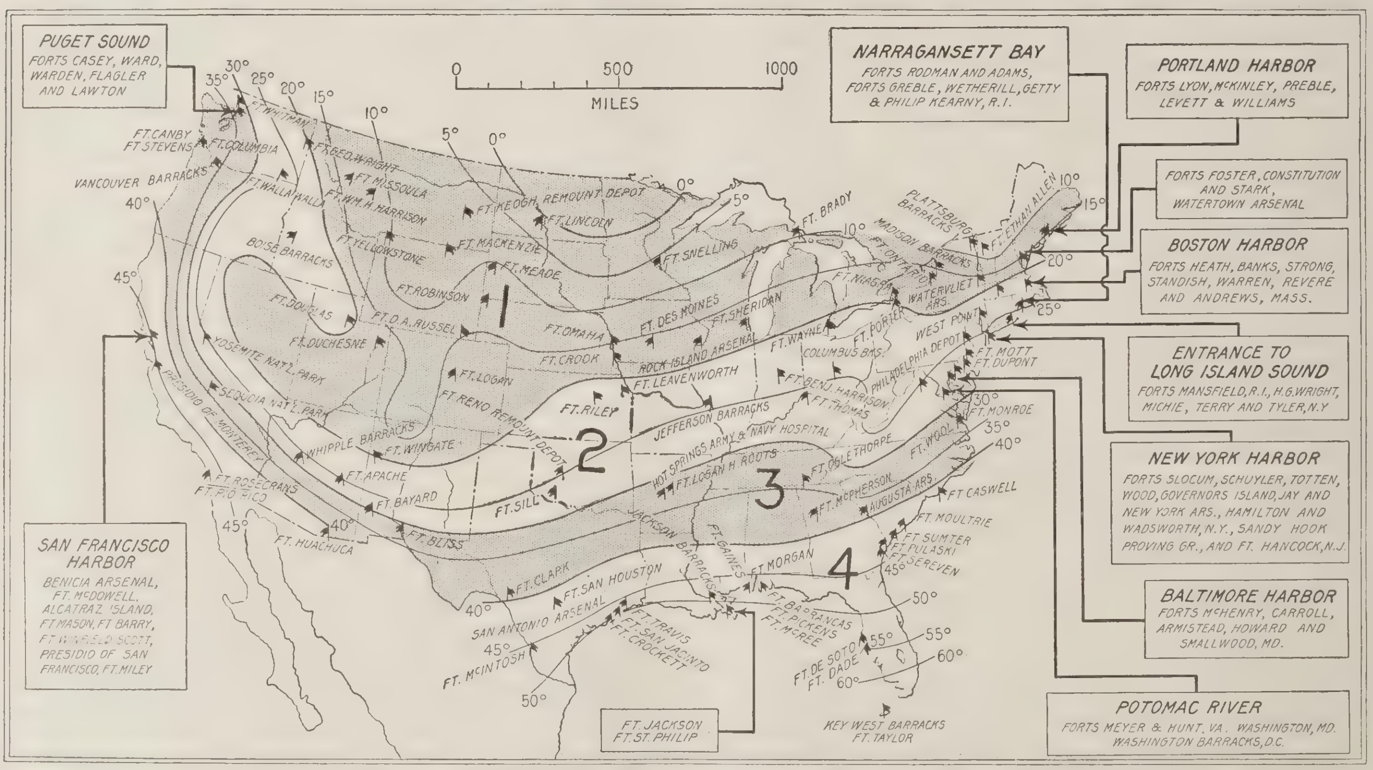
Burning Coal in the Army

By Marston Wilder*

SYNOPSIS—In years past coal was issued to men in the army according to their rank. This was conducive to much waste. At present the allowance of coal has been reduced to a thoroughly scientific plan. Not only is fuel purchased on the basis of its heat content, but it is issued according to climatic necessity and burned under the supervision of a trained fireman.

It used to be that coal was handled on the "hustle and use it" plan in the army. The easiest and quickest way the mineral could be bought, distributed and consumed was the means that best suited those who were compelled to handle it. As an illustration of the lack of consideration of the cost and value of the fuel an anecdote common in military circles serves best.

An officer who knew as much about coal as a prehistoric fossil was detailed to inspect several carloads delivered at a post by a contractor. He protested that he was not qualified to intelligently perform the task, but lack of knowledge availed him nothing in escaping the duty. Forthwith he went to see the coal and reported that it was black and that he thought it would burn.



ZONES OF EQUAL AND MEAN MINIMUM TEMPERATURE

For a long time Uncle Sam was generous with supplies of coal for military use. No scientific means of buying and using it was considered necessary. Officers were entitled to monthly allowances according to the rank they held. A second lieutenant might have an allowance of a ton a month, a captain two tons, a major three tons, a colonel four tons, and so on.

Of course the Government knew that it took no more coal to keep a colonel from shivering than a lieutenant, but the difference in allowance was due to the number of rooms that officers of different rank were entitled to have heated at public expense. The troops quartered in barracks were allowed stated amounts, derived from tables of equivalents showing the amount of coal in pounds equal to a cord of standard oak.

But now not only the buying, but the issuing and consumption of coal, have been reduced to a scientific basis. Allowances in all quarters and barracks are now determined by the square feet of grate surface, the size of the rooms in the buildings and other conditions recognized as factors in heating and cooking.

Formerly, when fuel was allowed on a basis of numerical strength of the garrison in men, the amounts allowed were uniform to a great degree throughout the army. Geographical locations did not make any decided difference. Army officers long recognized that there was a wanton waste of fuel because there was no one directly responsible for it after purchase and delivery through the army quartermaster's department.

Soldier servants were used at the officers' quarters for firing the heating apparatus, and soldiers fired the heating plants in the basements of the barracks. The officers sought to have men enlisted who were qualified to handle fuel scientifically and economically and who were expert in firing and caring for boilers.

A Scientific Policy Has Been Adopted

The War Department has just adopted a fixed policy. The first thing it did was to create the rank of fuel overseer in the quartermaster corps. It is the duty of

---

*Fort Casey, Island County, Wash.

THE COAL STORAGE AT A THREE-COMPANY POST

this noncommissioned officer to superintend the delivery, storing, distribution and consumption of all fuel coming into a military garrison. In addition to these duties this soldier is a sort of foreman over all the men in a post who have the firing of heating plants in their charge. His services are designed as much to make a saving in boiler upkeep as to effect economy in the use of coal.

The firemen in the barracks are now required to keep a daily record of the amount of coal used and to record the temperature of the rooms. No such records were formerly kept, and fuel was used indiscriminately. The only vigilance exacted was that the firemen were not to exceed the monthly allowance, and as this was usually generous to a fault, coal was reduced to smoke just for the fun of it.

The fuel overseer keeps records showing the amount of fuel issued to buildings. He must also make daily visits to all firerooms to inspect methods of firing. When he thinks there is an improper use of coal, he is compelled to report it to the commanding officer for remedial action.

The new regulations provide that the use of fuel will be based, first, upon the area in square feet of grate on which the coal is burned; second, on the average outside temperature during the time the coal is burned; third, on a factor which takes into account the human element, or those charged with the operation of heating plants.

An elaborate system of charts has been published by the Government as guides in scientifically heating buildings. There is one set tabulating the temperatures from which a mean temperature for every post has been determined. There is another set known as coal-consumption charts, which have been prepared for various minimum temperatures from plus 40° to minus 40° F. at 10° intervals, and the allowable rate of combustion at any intermediate (average temperature) between 70° F. and the minimum on any chart is directly interpolated. The charts show the allowable coal consumption per square foot of grate area at the several score of posts for steam and hot-water boilers.

SOLDIERS' BARRACKS WHICH REQUIRE LARGE QUANTITIES OF COAL

Assuming that a building is equipped with a Century boiler of 2,200-ft. capacity, with 10½ sq.ft. of grate surface, the allowance of coal according to the proper chart for January would be determined thus: The temperature for the month is shown by the temperature chart as 35°. Interpolating on coal charts at 35°, it will be found that 3 lb. of coal per square foot of grate area per hour is the proper amount to be used. The fuel allowance for the month would then be found as follows: 3 lb. × 24 hr. × 31 days × 10.5 sq.ft. ÷ 2,240 lb. = 10.45 long tons.

DELIVERING CONTRACT COAL AT AN ARMY POST

Where coal at various posts has a different fuel equivalent per cord of standard oak, it is necessary to apply corrections for difference in equivalents. Thus at each post in the service throughout the country the quartermaster must work out the monthly allowance for each building and tabulate it for ready reference. Hence where fuel was once allowed on a basis of rank to individuals it is now allowed to the buildings.

Allowances for hot-water heaters may also be determined from the charts. Allowances are based on the assumption that anthracite and good coking coals are used. Where other coals are employed, corrections of the amounts must be made in accordance with the instructions for figuring equivalents. Each·cooking stove has a definite allowance of coal governed by the type and pattern of the army range in use. One range is allowed 2,500 lb. per month, another 4,500 lb. and a still larger one 6,000 lb.

The charts are most interesting documents. They show temperatures at all posts for many years back. All the leading capitals of the world figure in the charts, owing to the fact that the army has military attachés on duty abroad who must be taken care of in the matter of fuel. There is a separate chart for buildings equipped only with old-fashioned heating stoves. The zone charts cover every month. One of them is shown herewith.

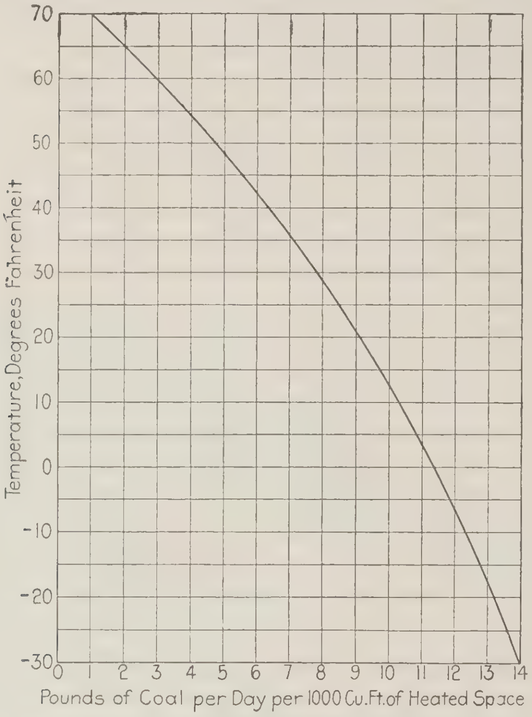


CHART SHOWING FUEL CONSUMPTION PER 1,000 CU.FT. OF HEATED BUILDING

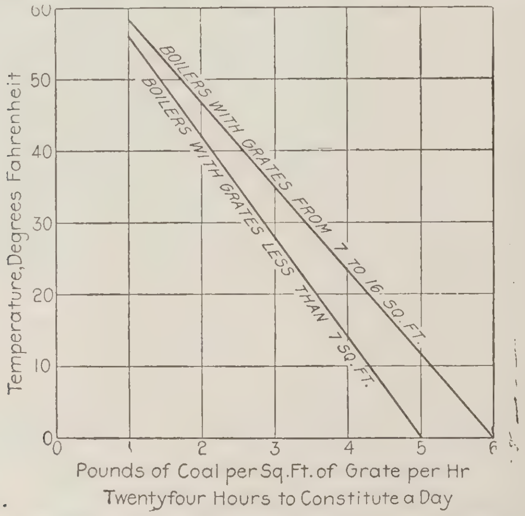

CHART SHOWING ALLOWABLE RATE OF COMBUSTION PER UNIT OF GRATES

Uncle Sam has some army posts where coal is burned the year round for heating purposes, and these are within the continental limits of the United States. When humanity is sweltering in summer heat in Eastern centers, the post on Puget Sound has fires going sometimes all day long and always during mornings and evenings. In our tropical possessions, of course, no coal is used at all for heating.

On the other hand it is reasonable to suppose that more fuel is consumed for heating purposes in winter at the posts in Alaska—where little is used in summer—than at Puget Sount posts 12 months in the year. For although the summers are cool and even chilly at times in Washington State, the winters are generally extremely mild.

The army now buys its coal on the B.t.u. basis. Formerly, the fellow who was lowest in price, and who therefore furnished only the cheapest coal, got the contract. Uncle Sam now pays for the heat delivered to him, not a "black substance that looks as though it will burn." Proposals are sent out in the early spring all over the country inviting bids for coal for each fiscal year beginning July 1 and extending to June 30 of the following year. These proposals are sent all bidders on request from the nearest chief quartermaster.

⁂

The Eastern Freight Congestion

At the conclusion of a conference of freight-traffic men of the Eastern trunk lines on Dec. 14, these additional embargoes were announced, owing to the continued congestion and the large accumulation of freight:

The New York Central R.R. has embargoed all flour and grain products for export and also lumber and hay consigned for any lighterage deliveries.

The Erie R.R. has embargoed shipments of flour for export requiring "lighterage free" deliveries.

This is in addition to the previous embargo on flour when carried under through export bills of lading.

The Baltimore & Ohio R.R. has placed an embargo on lumber from the South destined to New York for export.

The Central R.R. of New Jersey has embargoed all traffic destined to New York for delivery to coastwise steamers and also traffic to the Pacific Coast for delivery to steamers at New York. Shipments of all classes of freight consigned to Brooklyn terminals have also been embargoed.

The Baltimore & Ohio R.R. on the same day declared an embargo on all grain for export through Baltimore.

At present there are 4,000 carloads of grain at Baltimore awaiting unloading and en route for export, in addition to which the local elevators of the road, having a capacity of 2,500,000 bu., are filled.

The Pennsylvania R.R. has posted the following notice:

Embargo 3,457—Owing to the large accumulation of traffic and to avoid if possible the absolute blockade now impending, embargo all freight, carload and less than carload, including traffic switched from connecting lines, originating at all points, except on the Pennsylvania R.R., P., B. & W. R.R. and W. J. & S. R.R., when consigned, reconsigned or to be reconsigned to New York lighterage, whether export, coastwise or domestic, except dressed meats and other perishable freight, flour and other foodstuffs for local human consumption. Shipments billed up to and including Tuesday, Dec. 14, will be accepted.

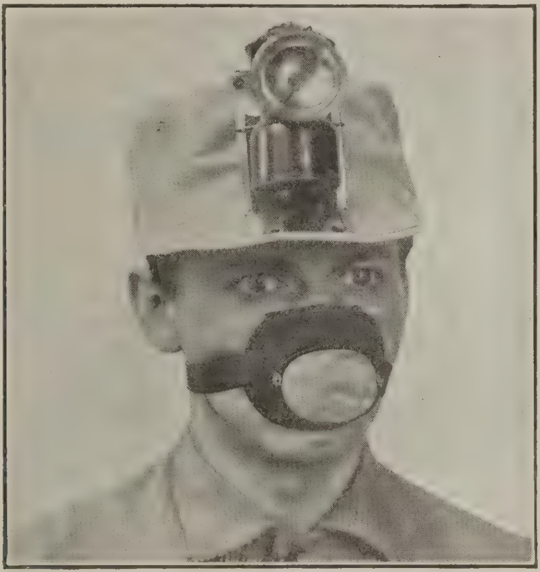
Embargo 3,458—Owing to the large accumulation of traffic and to avoid if possible the absolute blockade now impending, embargo all freight, carload and less than carload, including traffic switched from connecting lines, originating at all points, except on the Pennsylvania R.R., P., B & W. R.R. and W. J. & S. R.R. when consigned, reconsigned or to be reconsigned to Waverly, including Newark and points east thereof, and for connecting lines via junction points east of Waverly, except the N. Y., N. H. & H. R.R. This embargo not to include live stock, dressed meats and other perishable freight, flour and other foodstuffs for human consumption, coal for delivery at Harsimus Cove. N. J., railroad fuel supply coal for any line routed via junction points east of Waverly and coal for public service corporations. Shipments will be accepted billed up to and including Dec. 14.

New Apparatus and Equipment

A New Respirator

Most coal men are uncomfortably familiar with dust, both in the mines and in the tipples and breakers, but worst of all in the crusher rooms and on the yards at coke plants. While it may be an open question just how detrimental to life and health pure coal dust in small quantities may be, there is little doubt that the dense clouds of dust encountered wherever coal is crushed for coke making cannot exert any other than a harmful effect on the lining of the lungs.

It would seem rational to suppose also that the sharp, gritty dust which is unavoidably inhaled by the workmen while watering down and drawing coke from the ovens exerts an irritating and baneful effect upon the respiratory organs. Such dust is doubtless as detrimental to the health as is the dust from limestone or other rock.



THE RESPIRATOR IN USE

To provide a suitable protection against fine particles of matter of all kinds from entering the lungs and respiratory tract generally, the Multi-Metal Separating Screen Co., 68-72 East 131st St., New York City, has recently placed on the market what it calls its "Pulmosan" respirator. The screening material in this instrument consists of several thicknesses, each capable of arresting the passage of dust of a certain degree of fineness and each supplementing the others in action.

The body of the respirator is made of a soft, pliable material impervious to both air and water and covered with cloth upon each side. The whole instrument weighs but ½ oz. It may be crumpled up and carried in the pocket indefinitely. When wanted it may be removed from the pocket and adjusted to the face and nose almost instantly. It may be washed thoroughly either with or without soap. It fits any face and does not interfere in any way with the wearing of glasses or goggles. It also presents a neat appearance and does not interfere with conversation.

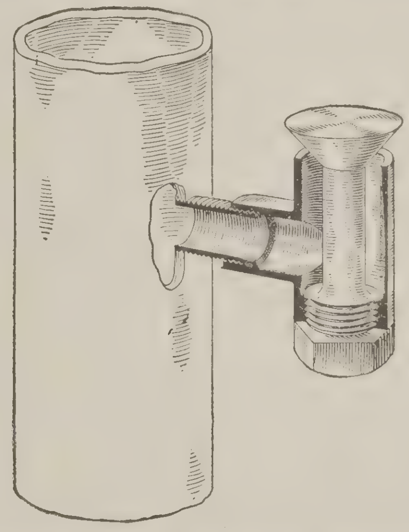
The manufacturer sells these respirators for 50c. each. They have been received with considerable favor in the metal-mining field as well as in numerous manufacturing processes where fine dust of an animal, vegetable, mineral or metallic nature is encountered.

❖

A Fire-Sprinkler Nozzle

A spraying nozzle that is thoroughly efficient and at the same time cheap can be made from a ½-in. tee. The upper part of the tee down to the lower threads is reamed out to a diameter of 1 in. and the upper end is faced off. A plug is made and inserted, as shown in the accompanying illustration. The lower end is threaded to fit the tee. The shank is turned down to ½ in., and the upper end is a cone of about 1½-in. diameter. In order that this cone may be accurately centered in the upper end of the tee, the threads of the lower end are tapped out while the tee is in the chuck for the reaming. If the cone is accurately centered, the spray is evenly distributed over the whole circle.

The amount of water discharged at any pressure depends upon the space between the upper end of the tee and the cone. This is adjusted by screwing the cone in or out, and the adjustment is maintained by a lock nut on the lower end of the plug. The pressure governs not only the amount of water discharged, but also the distance to which the spray is thrown.



THE SPRINKLER NOZZLE IN POSITION

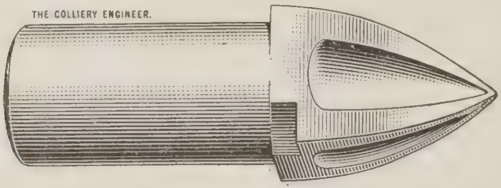
This nozzle, which is patented, is the invention of Dan Walters, master mechanic at the Hazleton shaft colliery of the Lehigh Valley Coal Co. At the breaker at this colliery 287 of these nozzles have been installed. With the pressure maintained by the pump, they will handle about 3,500 gal. of water per minute and distribute it to every corner of the breaker. They are so arranged that water may be turned into them by pulling a rope on the outside of the building. This makes it almost impossible for anything to interfere with getting water turned into the spray lines and renders the probability of serious fire much less. The nozzles are tested once a month, and the result is not only the knowledge that the spraying apparatus is in proper working order, but a good washing out is given the breaker.

One of the great advantages of this nozzle, in addition to its cheapness, is the fact that it can be attached to any line large enough to be tapped for a ½-in. tee. All that is necessary is to drill a hole in the pipe and thread it, put in a nipple and attach the nozzle.

Hollow-Ground Crusher Tooth

In order that coal may be broken down in size with the production of the smallest possible amount of undesirable fines, the rolls of the crusher should be provided with sharp teeth. The sharper the teeth the more cracking will be the action and with less of the objectionable crushing; in other words, the less fine sizes and the less power consumption.

Crushing is done best by a tooth having sharp edges, and commonly a square tooth is used. Of course the edges wear off rapidly because they do most of the cutting. Furthermore there is less metal at this point to resist wear, so that a tooth originally square would entirely lose its edges and become round if it were used long enough.



HOLLOW-GROUND CRUSHER TOOTH

In order to increase the useful life of the crusher tooth, the Wilmot Engineering Co., of Hazleton, makes use of the principle of the hollow-ground tool. The accompanying illustration shows that the middle of each face is depressed so that the edges can be worn away to a considerable extent before they become so dull as to produce too much fine coal and consume too much power.

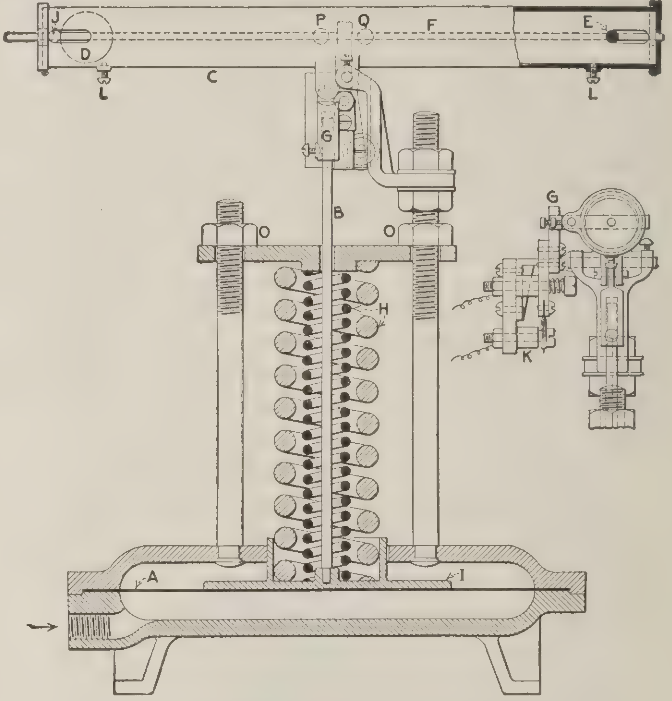
These teeth are drop-forged. They are made from high-carbon steel, so that they last for a long time. They are set in geared rolls running at speeds not greater than the velocity with which the coal drops into the crushing space. Therefore there is practically no pulverization by impact, as is the case with high-speed rolls.

Device for Controlling Pumps

A new device for automatically controlling motor-driven pumps and similar devices for filling tanks, standpipes or other water containers or for ringing signal bells has been recently placed on the market by the Golden-Anderson Valve Specialty Co., of Pittsburgh, Penn. This device automatically maintains within predetermined limits the level of the water in the tanks, standpipes, reservoirs or other containers, and does away with the annoyance of floats or other fixtures.

The pressure from the tank is communicated to the under side of the diaphragm *A* and forces the rod *B* upward, tilting the cylinder *C* and permitting the ball *D* to roll to the opposite end. There it hits the pin *E*, which is attached to the horizontal rod *F*, causing the stop *D* on the rod to move the lever or switch *G*, thus breaking the electrical contact and stopping the motor.

When the water level in the tank is sufficiently lowered, the springs *H* force the diaphragm *A* downward. The rod *B*, attached to the diaphragm plate *I*, causes the cylinder *C* to reverse its inclination, allowing the ball *B* to roll to the opposite end, striking the pin *J* which is attached to the horizontal rod *F*. This causes the stop *Q* on the rod to move the lever or switch *G*, making the contact with the post *K* and starting the motor again.



CONTROLLING DEVICE FOR PUMPS

The setscrews *LL*, shown at each end of the cylinder, are for the purpose of securing different variations of water level in the tank. The adjusting nuts *OO*, above the springs *H*, are for the purpose of obtaining the different heights of water desired in the tank or standpipe.

Coal Resources of North Park in Colorado

North Park, a great natural depression in the Rocky Mountains of northern Colorado, is described in a recent geologic and economic report by A. L. Beekly, of the U. S. Geological Survey, just printed and now being distributed by the Survey as Bulletin 596. The region is far from frequented routes of travel, its remoteness amounting until recent years almost to isolation, so that its geology and its economic resources have remained but very little known. The park includes practically all of Jackson County and is surrounded, except on the north, by mountain walls that rise 2000 to 5000 ft. above the bottom of the basin.

Some of the coal beds are in places very thick, one measuring at one place 66 ft. and at several places more than 50 ft. The coal is sub-bituminous and is remarkably clean. Although the high cost of railway transportation and the higher quality of the coal in neighboring more accessible fields would suggest that the demand for the coal would be practically limited to the park itself, yet the one coal company operating in the park on a commercial scale has marketed considerable tonnage of coal in northeastern Colorado and southern Wyoming.

The Labor Situation

SYNOPSIS—Strike occurs in the anthracite region over the steam use of small coal. Florence and Adrian mines in central Pennsylvania resume operations. The Ebensburg Coal Co. enjoins the union at Nanty Glo. Alexander Howat, one-time union president of the Kansas district, is charged with giving a loving cup to Charles S. Keith. A suit charging $500,000 damages is brought against the union in Arkansas.

The 12 foremen at the Diamond colliery in West Scranton belonging to the Delaware, Lackawanna & Western R.R. coal department, complained recently because No. 2 barley coal was supplied them for firing the boilers. They claimed that more work was occasioned by the small size of the fuel. As it seemed that their demands were unlikely to receive favorable consideration from the company all the men of the colliery to the number of about 1,500 decided to go on strike Dec. 8. On the following day the difficulty was settled after a conference between Arthur C. La Monte, the mining engineer of the company, and John T. Dempsey, district president of the union.

The company agreed to furnish the fireroom with No. 1 barley, a size larger than No. 2. The same number of shifts will be maintained, but if the coal furnished results in the total amount of coal shoveled being reduced 75 per cent. of one man's capacity, one car of No. 2 barley will be used daily, and if the amount shoveled is reduced to 75 per cent. of two men's capacity, two cars of No. 2 barley will be dumped into the boiler room every day. The whole requirement of the plant is three cars per day.

Adrian and Florence Return to Work

The 850 miners of Adrian and Florence in Jefferson County, Pennsylvania, have declared their strike at an end after having been idle since Nov. 22. The miners met in joint session, and on Dec. 9 the Adrian men returned to work. The Florence men were delayed by the condition of the mine till Dec. 11.

In a conference held Dec. 7 between B. M. Clark, attorney for the Rochester & Pittsburgh Coal and Iron Co.; Frank Pardoe, assistant general manager of the same company; James Purcell, district president of district No. 2 of the United Mine Workers of America, and James Marks, a board member of Du Bois, Penn., a compromise satisfactory to all concerned was contrived by the conferring parties.

Injunction Against Union Secured at Nanty Glo

The Ebensburg Coal Co. on Dec. 7 secured an injunction against the United Mine Workers of America for interfering in the operation of the No. 1 mine of Nanty Glo. The affidavit accompanying the petition for an injunction declares that Thomas King, Gazzy Carrol, Armando Pelizarri and several others on Nov. 30 went onto the grounds of the Nanty-Glo Coal Co. and attempted by persuasion and coercion to prevent the men from going to work for the company. The affidavit also states that the petitioners believe that the United Mine Workers of America is paying the moving expenses of some of the employees for the purpose of depriving the company of their services.

The partial strike of the miners employed by W. H. Hughes & Co., at Lilly, Cambria County, Penn., has come to an end after a four-month disagreement. The mines are working about half-time owing to a shortage of cars.

A Loving Cup which Caused Much Heartburning

The libel suit brought by Alexander Howat, ex-president of district 14 of the United Mine Workers of America, against certain persons who alleged that he had received bribes from the Southwestern Coal Operators' Association is still creating much excitement. Joseph H. Hazen, superintendent of the Chapman Coal Co., at Mulberry, Kan., and an agent of the operators testified on Dec. 9 that A. Howat and Fred Holt, the secretary-treasurer of the district union, presented him with a loving cup in September, 1910. Mr. Hazen said the cup was understood as "coming from the union" and was presented after he had paid Howat and Holt $10,000 for their influence in securing a favorable contract with the striking miners. The cup was "for Joe for his help in consummating the contract."

In 1913 rumors began to circulate, and several mine workers came to Hazen's office to see this wonderful loving cup, and Hazen testified that Howat gave $10 to buy a modest substitute with an inscription "Presented to J. H. Hazen for services rendered Chapman Coal Co." This fake cup was to be shown all miners of too inquiring a disposition, but unfortunately there was a photograph of the original loving cup, and worse yet, this photograph appeared in the window of a newspaper office at Pittsburg, Kan. It is not known where the picture came from. Hazen handed the cup to Keith and desired him not to make a photograph of it. In his testimony he said he presumed the cup of love and discord was in Keith's safe.

Despite Alleged Graft Howat Became Penniless

Though Howat was declared to have received large sums of money for his services, it was alleged that in 1914 he was penniless and asked for a loan. This was after the disclosure which followed the filing of the Bache-Denman suit. Howat told Hazen according to the latter's testimony that he did not blame him for his exposure of the bribe in court, but he objected to his saying that Howat received more money than Holt.

Later according to Hazen, Howat was paid $30, and he asked for $1,000 to go to Illinois to get married, agreeing to leave the district for good. Keith refused to give him money, but according to Hazen he promised to give Howat a job in Wyoming.

The Pennsylvania Mining Co. Wants $500,000

The Pennsylvania Mining Co., of Arkansas, with offices at Scranton, Penn., which operates mines at Clarksville, Ark., in Johnson County, filed suit on Dec. 8 against the United Mine Workers of America charging a "national conspiracy to monopolize the coal-mining industry of the United States." The local, district and international officials are sued and recovery of $500,000 damages is sought.

Since the company was organized in 1910, it has been operating "open shop," and the defendants, the company alleges, have frequently attacked the corporation. After the company's workmen went on strike in June and the men joined the union, men who still worked at the plant were assailed by masked men, its pumps and filtration plant being destroyed.

The petition desires the courts to garnishee a large number of coal companies in Arkansas, Oklahoma, Kansas and Texas to hold funds which these companies have collected for the union. John P. White, the president of the international union, and K. C. Adams, national publicity agent, are named among the defendants.

To Re-Establish the Interstate Agreement

An attempt is being made by President J. P. White, of the United Mine Workers of America to restore the interstate scale meeting. He has invited the operators of Ohio, Indiana, Illinois and western Pennsylvania to meet with the mine workers' officials in Indianapolis and discuss the matter. No date has as yet been set. The four-state agreement ended in Chicago about two years ago, the meeting closing without the pact being renewed.

The United Mine Workers have engaged Tomlinson Hall for their mammoth biennial convention which is to last from Jan. 18 to Feb. 4. The Indiana Retail Hardware Dealers were to occupy the room for the week of Jan. 24, but they will now meet in the German House. There will be about 2,000 persons present, and the City of Indianapolis will not be asked to contribute a cent to the entertainment of the delegates.

Recent Legal Decisions

Pollution of Streams in Mining Operations—"To so pollute a stream by mining operations that the waters are impure and unfit for domestic use" of downstream land owners "and from which noxious gases and disagreeable odors arise rendering property used as a residence less comfortable gives a right of action for damages, and this is true regardless of the methods of operation, negligence in such cases not being a necessary predicate to the cause of action." (Alabama Court of Appeals, Yolanda Coal and Coke Co. vs. Pierce, 68 Southern Reporter, 563.)

Right to Eject Intruders—In dismissing a suit brought against a coal company for assault and battery committed by one of its officers in ejecting plaintiff, a discharged employee, from the company's office, the Kentucky Court of Appeals adopted the following rule in the case of Lunsford vs. Hatfield Coal Co., 178 Southwestern Reporter, 1166: "It is the undoubted right of a lawful owner or one claiming title and rightfully in possession or of an occupant of premises to retain possession and to use such force as may be reasonably necessary to remove therefrom trespassers or intruders or persons originally on the premises by license or permission who subsequently create a disturbance or conduct themselves in an improper manner and refuse to desist or leave on request."

Who's Who in Coal Mining

Arthur C. La Monte

Arthur C. La Monte has been a member of the mining department of the Lackawanna R.R. for more than a quarter of a century and is now general manager.

Mr. La Monte was born in East Worcester, N. Y. When he was 14 years old his parents went to Scranton. After graduating from the Scranton high school he was employed by the Central Railroad of New Jersey at the time when it was being built into Scranton. After the work was finished, he was offered an opportunity to continue with the company, but it would have been necessary to leave home so he gave up the work and entered the employ of the D., L. & W. That was 26 years ago.

A position as chainman in the engineering corps was his first job. Feeling the need for more education, Mr. La Monte studied at night with the help of E. A. Bartel, who was then assistant chief engineer. Thirteen years later, in 1902, Mr. La Monte himself became assistant chief engineer, and in 1905 he was made chief engineer.

ARTHUR C. LA MONTE
General Manager of the D., L. & W. mines

Now, at the age of 46, he takes the place made vacant by the resignation of Col. R. A. Phillips, who is recognized as one of the best of the executives and mining men in the anthracite district. It would be hard to find a record showing fewer changes than that of Mr. La Monte. The Lackawanna has appreciated a good man and treated him well. The promotion was a great surprise to him, but he has earned it, and his associates in the Lackawanna are genuinely pleased by it. He has grown up in engineering work and loves it and leaves it with regret, but the higher officials of the company know that he has the ability to fill the larger position and need him in it.

Mr. La Monte is a past president of the Engineers' Society of Northeastern Pennsylvania and a member of the Peter Williamson Lodge of Masons. For years he has been chairman of the committee in charge of the Railroad Y. M. C. A. in Scranton.

All through the anthracite region he is known as a square man, and no one ever doubts his honesty. He does his best for the Lackawanna, but never at the expense of the public. If there is a little pillar coal somewhere which could be taken out easily, but which is supposed to stay in the ground, the coal stays in. And the Lackawanna has very little trouble with anyone.

❖

Paying the Piper

The anthracite coal miners are now asking a 20 per cent. increase in wages at the next readjustment, doubtless in the expectation of taking on compromise somewhat less. The operators say that this would add 41½c. a ton to the cost of domestic coal. They reach this conclusion by showing that one-fourth their output comes in steam sizes, which must sell in competition with bituminous coal, and so cannot be advanced in price; that one-tenth of the anthracite output goes into operating the mines, and that on the quantity that remains to sell to the forgotten man of everyday life the extra $22,000,000 of payroll would fall. This, the operators believe, would amount in practice to an advance of 50c. a ton in retail prices.

It is an interesting question how far the public is willing to pay for the gratification of its benevolent desire to see wages raised on every hand. When it appeared that these came out of the plutocratic mine owners, that was one thing, but as it is gradually dawning on the public that wages reflect themselves in the cost of commodities, in the threat of six-cent fares, etc., the situation looks different. In earlier times the employer, whether in coal mines or railways, bought labor in the open market at prices determined by the law of supply and demand. The community now decrees the wages.

Whenever a great body of employees go out on a strike, public opinion compels the employer to yield to arbitration whether he could hire other men to take the vacant places or not. And arbitration always comes out the same way. It means an advance, perhaps one-half or one-third as much as the employees ask, but still an advance. And this finds justification in the increased cost of living, due in part to successive advances in wages in other callings. For example, advances in coal costs in recent years undoubtedly furnish an argument for increased wages for our street car and steam railroad operatives. The latter, in their turn, carry scores of commodities upon which the miners depend for livelihood, the prices of which are spiraling upward.

Where are we coming out? The law of supply and demand works automatically, even though with some palpable hardships. Its giving way to wage regulation by public sentiment, as expressed through arbitral boards, raises the possibility of serious complications, not least of which is the likelihood that the more numerous body of employees, because of their greater power over public sentiment, will get better wages, other things being equal, than some less numerous body that may deserve more of their employers. And then, what are the people who sell their wages and products, according to the law of supply and demand, like the farmers and countless small industrial workers, going to say of matching pennies with those whose wages depend on the community's measure of benevolence?—Boston (Mass.) *Morning Herald.*

Editorials

Secretary Garrison and the Army in Colorado

Secretary Garrison in his annual report gives much praise to the action of the regulars in Colorado, as follows:

> Injected in the midst of an inflamed populace lately in open conflict they restored and maintained order. Their poise, justice, absolute impartiality and effectiveness not only applied the proper corrective to the situation on the ground, but commended them to all, whatever the individual sympathies might be, and highly commend them to us. Such a demonstration of the spirit which animates and controls the American army must make every citizen proud thereof.

The army truly showed its efficiency in overriding without violence the rights of the operators. It forbade the opening of mines and the hiring of men. Its poise and effectiveness cannot be denied, but justice and absolute impartiality were so corrupted at their source by the orders of their civil heads that the less said about them the better.

It was decided when the troops entered Colorado that the *status quo* with only violence removed was to be maintained. The mines shut down by union violence should not start operations; the men driven away by the union should remain away while the army was in control. And it was so. Perfect poise and efficiency may be granted, Mr. Garrison, but justice and impartiality are other matters.

The Trend of Conditions on New Coal Contracts

The most important contract news at Philadelphia is the announcement of the new prices by the anthracite companies. Contrary to expectations the leading companies are offering to contract only for the first three months of the new year, but the most surprising feature is that the prices have been increased. The increase amounts only to about the state tax, except on buckwheat, which is considerably more, but consumers were notified that the prices are strictly net, and there will not be any refund of the tax on this coal. It is intimated that this increase has been made to meet the expense of insurance under the compensation law effective Jan. 1.

An advance in the prices seems to have been forecasted by the only contract of any size that was let in this vicinity during the past few weeks—that of the Philadelphia County Prison for 2,000 tons of buckwheat coal (No. 1,637, pp. 870, 959). In this instance the company which formerly had the contract entered a bid at a much higher figure than on the old contract. Other bids were also at high figures, and the contract was finally awarded to a retail dealer, which is something unusual.

The trade is somewhat at a loss to understand why the companies will contract for only three months. In previous years when a wage scale was to be arranged, the usual contracts were entered into except for the addition of a stringent strike clause.

In the face of the new prices the consumers have been somewhat slow to tie up for their supply, even though it is already late in the season. On the other hand the individuals are known to have been in the market for some time with prices at the old figures and are willing to contract for the entire year, with the strike clause of course inserted.

Another item of interest in the contract market is the fact that the City of Philadelphia has not advertised for proposals to supply coal for the various departments. Last year bids were called for on Dec. 6 (No. 22, Vol. 6, p. 933). It may be that on account of the complete change in the administration the bidding on this large contract will be deferred even beyond the end of the year, as has happened on a previous occasion.

The price war on 1916-17 contracts inland from Boston, Providence and other New England distributing points began a month ago to extend to other places where steamers and barges could make deliveries. With almost no publicity and in less than a fortnight a large volume of such business had been closed. Corporations like the Amoskeag Manufacturing Co. (130,000 tons), the Bay State Street Ry. (120,000 tons), the American Sugar Refining Co. (70,000 tons) and F. W. Bird & Son (65,000 tons) bought their coal for the year beginning next April with only a few shippers knowing they were in the market. Only those in the closest personal touch had an opportunity to submit prices. While there is no positive information available, it is understood that most of these contracts were placed at prices well under the figures of early in the year.

Meanwhile the spot market developed rapidly. When water freights advanced to \$1.50 to Boston for prompt boats, options were quickly exercised or were withdrawn. No agency is now so keen on closing contracts as a month ago, and the buyers who neglected to accept propositions are in a difficult position. Now that water freights to Boston are \$3 or more and all-rail coal is selling up to \$2.75 at the mines, new sales in New England are likely to be almost exclusively of a spot character.

The comparatively few bids received by the Central Purchasing Committee at New York for furnishing less than 10,000 tons of anthracite and bituminous coal (No. 1,633, pp. 828, 911 and 959) impressed the city authorities with the fact that coal men are not anxious to tie up on contracts under present conditions. Only 11 bids were received, although about 50 proposals were sent to various dealers who are usually among the bidders for city work. This was due to the fact that the wage agreements in both the anthracite and bituminous regions expire on Apr. 1, and with the present condition of car and labor supply most dealers were not desirous to make contracts. The city will advertise some time this month for sufficient coal to tide over the various departments under the control of the committee until next summer.

Steam contracts awarded in Ohio during the past month have tended toward higher levels. This is especially true of contracts made by public service and state institutions. Several state contracts were awarded by the Ohio Board of Administration. This board has charge of all the state institutions, and its coal contracts range from 3,000 to 12,000 tons for each institution. In all recent contracts prices for mine-run and slack have been about 5c. a ton higher than during the previous season.

Right To Choose Laborers

It has been said that the Workmen's Compensation Board in Pennsylvania would put three questions to every corporation or individual who seeks exemption from carrying liability insurance. The reply to these questions must state that no discrimination shall be made in favor of unmarried men, young men or foreigners.

It may be well indeed to require the self-insuring individual to promise to take the married with the unmarried, youth with age and the native with the naturalized and newcomers, but whether it is constitutional or even legal is another matter. The courts may well rule that the discretion of the board relates only to the sufficiency of the security and that the action of the commissioners is entirely *ultra vires* when it is applied to the character of the men employed.

Old and feeble men are by the ruling of the board to be given an equal chance to be killed in hazardous occupations with the young and virile. Perhaps later, men with one arm or a game leg must be provided with work in a dangerous location just as freely as men in their prime. Apparently men with weak hearts are to be given jobs which are quite likely to cause that susceptible organ to fail. There is to be no discrimination in favor of the fit.

It is questionable whether this disposition to force round pegs into square holes is really for the advantage of the workingmen. It seems almost certainly unconstitutional and illegal, though as to desirability there may well be two opinions.

Section 305 of Act 338 clearly states that "an employer desiring to be exempt from insuring the whole or any part of his liability for compensation shall make application to the bureau showing his financial ability to pay such compensation, whereupon the bureau, if satisfied of the applicant's financial ability, shall by written order make such exemption."

There is more to the same end, but enough has been quoted to show that the operator can still hire and discharge whom he will, and the bureau cannot say him nay. He can well refuse to answer the three questions which the commissioners are not entitled to ask him.

* * *

Conservation and Waste

For many centuries it has been customary to regard the conservation of material as the only form of conservation worthy the name. It is only recently that we have learned to look with solicitude on the waste of labor and laborers. However, we do not yet realize the true importance of productive labor. A few apples fall to the ground and are wasted, and everyone deplores the loss; tons of coal are buried underground, and conservationists bitterly bewail the waste, but we go into the market and find men all the day idle without any regret, though the men thus living without toil not only throw away their own lives, but the large body of material which they consume.

So the industry owes a debt to H. M. Chance for his remarks at the dedication of the Mines Building of the School of Mines of the Pennsylvania State College on Nov. 5, when he pointed out that too many of the conservationists belie their name and promise only to replace a prodigality in the use of material by a far more wasteful prodigality of labor.

But Mr. Chance carried his argument too far when he said that it did not pay to remove all the coal except in longwall work. He went too far when he assumed that the pillars could not be removed in room-and-pillar works without using some artificial substitute, for in some places where 95 per cent. of the coal is recovered, the cost of that conservation is little or nothing.

There is no question but that larger recoveries with economy could be made all over the United States, except in the Pocahontas, Georges Creek, Fairmont and Connellsville regions, where the waste is already negligible. It may be added that in few districts are pillars now left for the purpose of supporting the roof. Pillars are abandoned either because, as mining is conducted, it does not pay to clear the way to them or because it is impossible and unsafe to remove them. The operator does not care if the roof does fall in abandoned rooms, and in most cases he hopes it will, so as to make a squeeze less likely.

The loss in mining is not as great as has been often stated, but most of it is deplorable and not to be defended by any argument of economy. Only where the surface is extremely valuable is a waste of fuel for roof support excusable, and even in those cases it at least calls for an adequate and careful defense.

* * *

Coal Mines Need Men

In our Dec. 4 issue we published a short note stating that a number of miners in Texas had expressed to us their desire for aid in effecting a change of employment, or rather a change of location. These men have been working only one or two days a week and find it nearly impossible to live on the income thus afforded them.

Following the publication of this note a number of mining companies in other parts of the United States have both written and telegraphed us, offering employment to any number of worthy miners. This confirms us in the belief that miners in any part of the United States can now find steady employment if they will only look about them. One company in southern West Virginia wires that it can accommodate 10 families at once. The coal seam at this mine averages from 4 to 5 ft.; competent miners can earn from $3 to $4 a day.

An interesting letter from a very large Canadian company says: "We need experienced hand-pick coal miners; also men for shooting and loading coal after mining machines. A number of puncher-machine men are likewise desired. We have steady work all the year round for miners. However, we cannot employ men who are natives of the countries at present at war with Great Britain."

We will be pleased to coöperate with mining companies as well as miners in bringing the right man and job together, thus meeting the large demand for mine labor.

Sociological Department

Dr. August F. Knoefel

Of all the forces tending to promote first aid and good-fellowship in the Middle West stands out most prominently Dr. August F. Knoefel, of Terre Haute, Ind. He is one of the few men who believe that every man and every association of men can be organized for humanitarian work. Not a few of the purposes which induce a man to join a union may be used for the aid of the industry.

A man joins and gives his good money and services to the union because he believes in solidarity or in the seeking of advantages for others while he is laboring for an improvement of his own condition. It is for this same laudable reason that the miner joins a first-aid association. In fact there is an idealism in both which is of like, if not equal, value. There are two ways of looking at the union—as a mutual association of the men or as a dissension with the operators.

DR. AUGUST F. KNOEFEL

But Doctor Knoefel looks at the existence of the union as a recognition of a social duty, and as a result he believes that the union man as a member of the union can well be brought to foster first aid.

Little by little the miners are beginning to see that their view and the operators' view that union means dissension with the operator is a delusion wherever the collective bargainers are reasonable. Of course they are not always gifted with reason and the differences are not always easy to determine. But still there is always the possibility that the union will be what its name implies and not merely an instrument of aggression.

Dr. August F. Knoefel, formerly chief surgeon for the Vandalia Coal Co., was the third president of the American Mine Safety Association, replacing John P. Reese, a man who had a quite similar viewpoint. The entry of the association as a body into the National Safety Council as the mining section involved a reconstruction in which H. M. Wilson became chairman, H. M. Wolflin, secretary, and B. F. Tillson, Harry Davis and W. A. Luce, vice-presidents, but nevertheless Dr. A. F. Knoefel and John P. Reese remain the leading figures in the Middle West, where their helpful certainty in the excellence of people in general enables them to aid in inducing the unions to take a leading part in first-aid activity.

Old Company Prize Scholarship

The Lehigh Coal and Navigation Co. has offered a scholarship in Lehigh University as a prize to that student in its schools who shall pass the entrance examination to Lehigh with the highest grade. The prize was announced at the annual banquet of the Panther Valley Mining Institute last October, and there are 18 contestants now preparing themselves for the examination. It is the plan of the company to expend about $350 per year for the full period of four years, so the prize is well worth striving for.

The institute school for the present year has an enrollment of 239, with an average attendance of 162. The classes, with the number of students in each, are as follows:

Subject	Enrollment	Average Attendance per Month
Scholarship	18	18
Mining	30	16
Mechanics	23	19
Electricity—		
Beginning	41	26
Advanced	6	5
Primary	85	53
English	36	25
	239	162

Last year the enrollment was 175, and the attendance fell off considerably toward the end of the year. The reason for this is interesting. It was not owing to dissatisfaction or failure to progress, but to the fact that a considerable number of scholars in the primary and English classes thought that they had learned all that was necessary when they could read fairly well and solve some simple problems in arithmetic.

In the class in mining care is taken to instruct the students in practical subjects. The certificate given at the end of this course shows that the student has passed an examination equivalent to the mine foreman's examination. The success of the work is well demonstrated by the fact that no student who has completed the mining course and then taken the state examination for mine foreman has failed to pass.

The students are all employees of the Lehigh Coal and Navigation Co. Membership in the institute costs $1 per year, and this includes the banquet, which is alone worth more than the subscription paid. The only expense to students is that for books furnished at cost. The total expense for a course is never more than $2.

Discussion by Readers

Output of British Coal Mines

Letter No. 1—My attention was drawn recently to the editorial relating to the output of British mines, as referred to in a paper read before the North of England Institute of Mining Engineers by Samuel Dean, an Englishman now engaged in coal mining in this country. Permit me to say that many of the statements made, *Coal Age,* Nov. 6, p. 762, are, I believe, misleading.

Having spent 30 years of my life in the coal mines of South Wales, having performed almost every class of work, including the management of mines, and feeling that I understand most of the conditions that control the output of English mines, I beg to refer to a few of the conditions that must be considered in this connection.

Difficulties Encountered in Welsh Mines

The coal mines of Great Britain have generally a larger quantity of firedamp generated in the workings than the mines of this country. On this account, most of the mines here can use electric mining machines for cutting the coal, while the mining law of Great Britain prohibits the use of electricity in coal mines beyond the bottom of the downcast shaft.

Again, with respect to blasting the coal, the mining law of Great Britain expressly prohibits the use of powder in dry and dusty mines. It stands to reason that where it is possible to blast down the coal with powder, as in most mines in this country, a larger quantity of coal can be mined per man per day than where the coal must be brought down with wedges and hammers.

Again, coal is mined at a greater depth in Great Britain than in this country, and this causes a greater roof and side pressure in all rooms and entries. If the same difficulty were encountered in maintaining the roads, aircourses and rooms here as in Great Britain, many of the mines in this country now being worked would be obliged to shut down owing to the extra expense incurred in their operation. The cost of upkeep or maintenance of roads in Welsh mines is greater than that in any other mines in the world, as every coal digger in the mines of South Wales has a dayhand. Under such conditions, an output of 1 ton per man per day is considered good, and it is often not more than three-fourths of a ton per man. Also, owing to the great depth of the coal below the surface, the cost of sinking is much greater in Great Britain than in this country. Moreover, the mining law there compels the operator to line his shaft with brick.

Equipment of Mines Uptodate

Regarding equipment, there are mines in South Wales that will compare favorably with any in the world. Some of the mines put out 4,000 tons of coal in 8 hr. With regard to the capacity of railroad cars in Great Britain, this varies from 7 to 20 tons. Such cars were built eight years ago when it was found that larger cars would not suit the conditions in the mountainous country of that section, where the track curves are often very sharp. The capacity of the mine cars used underground varies from 3,000 to 4,000 lb., which shows that they are not such small cars after all.

In some of the mines there are coal seams not more than 2½ ft. thick, and in a few instances the thickness of the coal does not exceed 2 ft. In these mines the roof is taken down so as to give sufficient height for the horses to take the cars to the face of each room. In the Clydach Vale mine, owned by D. A. Thomas, who is at present in this country as agent for his government, horses are employed that measure from 14 to 18 hands high. Some of these animals cost from $300 to $500 each. The fact that they take the cars to the face of each room shows that much work is done to maintain sufficient headroom on the roads. An inspector is employed by the company to see that this is done, and where there are marks showing that the horse rubs against the roof, the place is stopped until this can be remedied. From this description, I think it will be easy to see that British mines have no "pigmy equipment."

Attitude of Miners' Union

Speaking of the attitude of the miners' union in Great Britain, the article defines it as "false political economy," which reference I fail to understand. If the miners claimed an advance in proportion to the selling price and because of the high cost of living, in my opinion it was justified. Welsh coal has been sold at $4.80 to $5.28 per ton during the last five years, and the highest price paid for mining will hardly reach 75c. per ton. Coal operators, in this country, would be glad of such a margin.

Reference is also made to the mines of Great Britain as being "extremely warm and enervating." But this is the effect of natural conditions. I have seen gobs in these mines so warm that one could not hold his hand on the stone, and an air current of 20,000 cu.ft. per min. was passing the place. All of these conditions must be considered when comparing coal mining in Great Britain with that in this country. William James.

Mystic, Iowa.

⁂

Fluctuation in Price of Coal for Different Grades

Referring to the editorial entitled, "Why Different Grades of Coal Fluctuate Independently," *Coal Age,* Nov. 27, p. 890, I desire to draw attention to the third paragraph of the article, in which it is stated that the demand for the small sizes of anthracite depends only on "past use and the type of boiler-furnace grates already installed."

This statement would make it appear that if a concern has a boiler plant so equipped as to burn small anthracite, it does not care to change and use soft coal merely because its boilers are so equipped. This seems hardly to be the case. If there are sufficient advantages for changing over from small anthracite to soft coal, merely the fact that the boilers are equipped to burn hard coal will not deter many from making such a change, especially since it would not be very expensive to equip their boilers to burn the soft coal instead. It is no uncommon occurrence for a concern to remove grates that have been in use but a short time in order to replace them with proper grates and blowers to burn small anthracite and so effect the resulting economy.

Surely "past use" does not incline a concern to continue to burn small anthracite unless other valid and weighty reasons exist. There are today thousands of concerns burning small anthracite, and they are doing so in possibly 99 per cent. of the cases because they find it economical, not because they had been doing so in the past. Is it not a fact that the use of small anthracite has been increasing and not decreasing? That certainly would not be the case if it were merely "past use" that is causing plants to continue its use.

The Question of Confidence

Again, the editorial states that "once the trick is turned he (the plant owner) will feel a confidence that will make it difficult for the hard-coal salesman thereafter to reconvert him to the use of an anthracite fuel." Why? Why does the use of soft coal necessarily insure this "confidence"? There are plants operating today in all sizes from 100 hp. up into the thousands and burning small anthracite. They do not lack confidence in any degree, nor is there any reason why they should.

This paragraph in the article would almost seem to be a brief for soft coal, though I am sure that you had no such intention in writing it. Nevertheless the article is distincly unfavorable, not only to anthracite mine operators and coal companies, but also to all concerns whose business is more or less directly affected by the sale of anthracite. Surely you do not, on second consideration, believe such a statement as the following, which I quote from this article: "Such customers once lost might not be regained even if the price of the anthracite fuel were much reduced." There are not a few concerns that used anthracite and changed over to soft coal, but have again come back to hard coal, even without a price reduction. There are no doubt others that have changed to soft coal because of changes in price who would gladly and immediately go back to hard coal if the price of the latter were again reduced.

I shall be glad to have your further comments on this matter, if you feel that this is warranted.

New York City. V. H. Carples.

* * *

Responsibility of Miners

Letter No. 4—I was much impressed in the reading of Letter No. 2 by John Majer, *Coal Age,* Nov. 13, p. 814. I can heartily indorse all that he has said on the subject of the responsibility that rests with the miner when he goes into the mine.

Mr. Majer remarks, "Miners suffer more as a result of these enforced periods of idleness than the coal operators themselves." That statement is too true; there are thousands of miners throughout this and other states who can testify to that fact from their own experience. When the mines shut down last spring, many miners had to hunt work elsewhere, and some of them are still looking for places. Many have left the union fields of Ohio and have gone to the nonunion fields of West Virginia and Kentucky in the hope of finding employment that will give their families the necessaries of life.

Speaking of miners suffering in periods of idleness more than the mine operators calls to mind a little incident that happened the other night. We had just finished supper when there came a knock at the door. A man stood outside asking for something to eat. While my wife was preparing it, in response to my question he said that he came from Ohio, where he had worked for the Sunday Creek Co. until the big strike that closed the mines. He said that he had a wife and five children, and when the miners' aid ceased, he was obliged to hunt for work elsewhere. Now, with winter approaching, he had no job, no clothes and perhaps his wife and children were starving at home.

I took the man to the mine manager (foreman), who opened his heart and promised to start him to work in the morning. The man looked like a good miner, and I believe he will stick to his work. This incident, which is but one in many, shows clearly who suffer the most by such periods of idleness for which the miner, as an individual, is in no way responsible.

Miners Take Chances Needlessly

The miner is responsible, however, for his conduct in the mine. I believe every man in a measure is as responsible for the safety of his fellow worker as for the care and protection of his own family. As a class, miners are reckless men who take many chances when there is no need of their so doing. I have heard it argued that it is useless to attempt to stop these reckless habits, but in my opinion they can be stopped by giving these men a broader education relating to work and conditions in the mine. It may be a slow process, but eventually every miner will come to realize the danger of crossing over an examiner's (fireboss') mark or failing to set a post under a loose rock, and many similar things that today the miner chances. I hope this discussion will continue until some good is accomplished and every miner is impressed with his individual responsibility.

Eldorado, Ill. Ostel Bullock.

* * *

Store Checks vs. Thrift

Letter No. 8—I have been reading with great interest the letters relating to the store-check system. It is all very well for the industrious miner who cares for his wife and little ones to say that he has no use for the store-check system in company stores. Why? Because he has a few dollars laid away that he can use in time of need.

There is another side to this question, however, as we have a different class of miners to deal with and they are not few in number. I refer to the man who spends at least one week's pay on pay night, perhaps all his pay, and what is left for his wife is a brutal answer or a kick.

A Personal Experience

My own experience, briefly told, may serve to emphasize my claim that the store-check system is the only proper method of conducting a company store today. I am a miner 31 years old and have worked 21 years in the mines. Why? Because my father worked in the mine and brought me up to do the same. I am sorry to say that my father drew his pay in cash every payday and spent practically all his earnings instead of bringing the money home. The first payment was always made to the saloon, as father regarded this the most important. There might be two or three saloons, but all must have their pay on pay night, which was ended in a drunk. This would be followed the next day by many friends eager to drink the health of any man with a few coins in his pocket. Then came the sad story of who is to pay the store bill and the butcher, and this burden fell heavily on the wife and mother.

I recall that many a time mother would say, "Fred, you will have to wait this time for your shoes, the store must be paid." Is it strange that this experience compels me to say that the store-check system, with all its faults, is far better than the cash system, as it protects the wife and mother of a family and permits her to obtain the necessities of life, while at the same time it brings the drunken miner to his senses. The wife can go to the store, buy what goods she needs on the store-check system, and the husband gets a blank on payday. While the system thus gives the needed protection where it is necessary, it imposes no burden on the man who trusts and is trusted by his wife and family.

Practical Working of Store-Check System

To conclude this unhappy recital and clinch my argument, permit me to say that since being married, I have worked in a different mine and can buy at three different stores. The mine in which my father now works, I am glad to say, has a company store—one of the leading stores in town. On payday he draws a blank and as a result is in bed at 8 o'clock every pay night. If he is to get a glass of beer, he must beg the nickel from mother. I will say that the company store has saved my father, who would have been dead years ago but for the store-check system. If mother wants a pair of shoes, she can get them at the store. She has not been able to put much money in the bank, but it is great to know that the butcher and the store bills are paid regularly.

In closing, I want to say that the store-check system is a godsend to many miners' wives. Instead of doing away with this system, take away the saloons, and miners will have a better chance to make good. H.

——, Penn.

Letter No. 9—The discussion of the question of store checks versus thrift, growing out of the Foreword in *Coal Age*, Oct. 16, increases in interest. In answering the question whether the company store-check system is an evil and operates against thrift in the miner or whether it is a help to him in some instances, I speak from the standpoint of my own experience and observation as a miner.

My opinion is that it is an evil only to that class of miners who have misused the privilege, but to the average miner it has been helpful. The lack of forethought and of the exercise of economy and frugality in his own affairs is a greater obstruction to thrift in the miner than the store-check system. My observation has convinced me that the miner who objects to that system most is generally the one who, by reckless and improvident living, is forced to trade wholly at the company store because he cannot get credit at other stores and never has any money.

Extravagance Among Miners

I have known miners who made more than a hundred dollars a month and yet, with average families only, never drew a dollar in cash on payday, having exhausted all their wages in store checks. I have known other miners working in the same mine and earning the same amount, with about the same families to support, who used no store checks, but drew the cash payday. Before the next payday came around, however, the money was all gone, and there was nothing to show for it. It may be argued that these are extreme cases, but they are to be found nevertheless. Unfortunately miners of this class seem to have been born improvident. They have no management or forethought in regard to their financial affairs. They save no more money and apparently have no more comforts when earning a hundred dollars a month than when earning half that sum.

From the standpoint of thrift neither of these classes of miners seems to have the advantage of the other. But surely the reckless and injudicious management of the latter class cannot be attributed in any way to the store-check system. I have known other miners who managed their work poorly in the mines and could not make above fifty or sixty dollars a month, but who drew what store checks they needed, lived frugally and saved money enough to buy homes. Store checks did not operate against these miners. The miner who is thoughtful and economizing in his affairs, however, is not always the best and most reliable worker, as has been intimated. Some thriftless miners are willing and hard workers and always ready to go where needed. Many of them have good judgment about work and consequently make more money under the same conditions than the miner with more thrift, but they do not have the same ability to use their earnings to advantage.

Thrift Means Responsibility

The question has been asked, "Isn't thrift worth more than store checks?" Certainly it is, wherever it can be taught. But there are miners who have been in the mines for years and still have no conception of thrift or economy and seemingly never will have. They do not want thrift, for the reason that it carries with it the responsibility of thought, purpose and management.

For illustration: The general manager of a company where I once worked built for one of his employees a nice three-room house, which was to be paid for by the month at about the rate of the rent. When the amount was about half paid, this employee wanted the general manager to take back the house and return him the money paid, which, of course, the general manager would not do, but encouraged and insisted on his finishing payment and having a home of his own. The employee finally made all his payments and received a deed to the property. He then sold it for less than cost and quit work until the money was all gone and he was back where he was before. Several years have passed since this incident occurred and this man is without a home or a dollar in his pocket. Like many others he does not want to be burdened with owning a home.

In conclusion I will say that in my opinion the store-check system and the average company store, as conducted in this mining section, are not evils working against either the thrifty or the improvident miner. For illustration: Owing to the dull demand for coal, together with close competition and disadvantages in transportation facilities, many mines have not been operated steadily during the past months. And many of these, even when operated in connection with a store, have yielded only small profits, if any. Many would not have been operated at all but for the store. Working in many instances less than half time, many miners were compelled to spend in the store all they made. Without this half-time work, which they would not have had but for the store assisting the mine and with nowhere to go to better their condition, may I ask, Is not the company store more a blessing to the miner than an evil? Ask the thoughtful, industrious miner for his opinion in regard to the store and the store-check system.

JOHN ROSE,
Dayton, Tenn. Former District Mine Inspector.

A Flooded-Mine Proposition

Letter No. 4—Referring to the inquiry relating to the flooding of a mine as described and illustrated on page 646 of *Coal Age,* Oct. 16, I want to suggest the following procedure:

Advance the pumps with the unwatering of the places to near the face of room No. 4, where the machine cut through into the old workings. This will reduce the actual suction length or the distance the pumps must draw water. When the water has been sufficiently reduced pile sacks of sand along the face and in the undercut, close up to the machine, so as to cut off the flow of water as much as possible. Now, having extra sacks of sand ready and all preparations being made, quickly pull the machine back and block the opening with sand bags to stop the flow of water as much as possible. Most of this work, of course, must be done in the water accumulated at the face.

Then, proceed to build a dam of sand bags about 5 ft. back from the face, forming a semicircle about the cut, and build this, say a foot or 18 in. in height. Make the dam tight by plugging the inner faces of the bags with clay. When this is completed, it will be possible to construct a permanent bulkhead across room No. 4 about in line with the face of room No. 5. I think it will be safe to erect the bulkhead at this point, since practically 5½ ft. of barrier coal held back the body of water previous to the machine cutting through the pillar. Shallow trenches should be cut in the roof and the floor, of the same width or thickness as the bulkhead and extending across room No. 4, also in the ribs on each side, so as to form a good bearing for the bulkhead. The bottom will perhaps require the most careful attention, owing to its being softened by the action of the water, and this bottom trench should be deep enough to reach solid formation.

From the statement of the question, I do not believe that the head of water, in this case, is 100 ft. The inquiry states that the inflow of water ranges from 700 to 800 gal. per min. Say it is 748 gal. or 100 cu.ft. per min. Assuming that the hole broken through is 3x4 in. or, say, $\frac{1}{12}$ of a square foot, if the flow is 100 cu.ft. per min., the velocity of the water will be 1200 ft. per min. or 20 ft. per sec., which would show the head to be

$$v = \sqrt{2gh} = 8\sqrt{h}$$

and

$$h = \left(\frac{v}{8}\right)^2 = \left(\frac{20}{8}\right)^2 = 2.5^2 = 6.25\ ft.$$

In other words, the abandoned workings are, perhaps, filled with water over a considerable area, but the water probably has a comparatively small head. It is possible to calculate, under these conditions, the exact pressure of the water on a bulkhead or dam constructed at the face of room No. 4; but this will hardly be necessary in the present case. I would suggest the building of a reinforced concrete dam or bulkhead across the face of room No. 4 as previously stated. I estimate the horizontal pressure against a section of this dam 1 ft. wide and, say, 6¼ ft. high, under the estimated head, to be 1,218 lb.

The Pocket Companion of the Carnegie Steel Co. gives, for this pressure and a span of 4.5 ft., a slab 6 in. thick containing an area of steel reinforcement of 0.18 sq.in. per ft. of width. In triangle mesh, style No. 41, consisting of $\frac{7}{16}$-in. cold-twisted square bars, one every foot of width will be sufficient. Then allowing a factor of safety of 5 to cover unknown conditions, the slab or bulkhead in this case should be 10 in. thick, with 0.7 sq.in. of steel area reinforcement. This would require $\frac{13}{16}$-in. cold-twisted square bars, placed 1½ in. from the outer face of the dam and one bar per foot of width.

A. W. HESSE, General Manager,
Lincoln Coal Mining Corporation.
Big Creek, W. Va.

The Coal Age Pocket Book

There has been such a demand for the early publication in book form of the pages that have appeared in *Coal Age* each week under the title, "Study Course in Coal Mining," and so many inquiries have been received in regard to the ultimate scope of the work that it has been decided to issue in January, 1916, three sections of the book, which will be known as "The Coal Age Pocket Book."

The matter has been prepared by J. T. Beard, of the *Coal Age* staff of editors, and is not a compilation of other publications, the subjects being treated originally and independently with a view to eliminating extraneous matter and presenting in a simple, concise form only what is essential in the study of the subjects relating to coal mining.

One of the prominent features throughout the book is the unification of standards and constants commonly used in engineering, the derivation of which is shown, as far as practicable, for the assistance of those who desire to study the rudiments of each subject treated. The book is written as an aid to study and combines matter needful for the beginner and valuable to the engineer.

The present publication will include sections on arithmetic and mensuration, including logarithms, geometry and trigonometry, mine gases and ventilation. The pages in each section will be numbered independently to permit extension in later editions as each subject is amplified. It is a book that even in its present incomplete form will prove a helpful companion to every mine manager, superintendent, foreman, assistant foreman and fireboss—a valuable reference book for engineers and a simple and instructive textbook for beginners.

Inquiries of General Interest

Coal Salesmanship

As one interested in the sale of coal, I would like to ask, What should constitute the actual ability of a man employed in the sales department of a large coal company? In other words, what must be the qualifications of a man able to sell coal; what must he know?

Is this knowledge to be obtained from books or from experience in the actual mining of coal? Are there any books published on this subject that would help me? I am getting my experience underground, but hope some day to get into the sales department, and I desire to fit myself in every way possible for the work that will be required. R. J. Lauder.

Emeigh, Penn.

A good salesman in any branch of industry must be possessed of many qualifications. It is important that he should know thoroughly the article he has to sell. This knowledge must include not only the qualities of the article or substance, its source of production, details of handling, storage and manufacture, but also its application to practice and adaptation to different conditions with respect to the purpose for which it is intended. He must be well informed of its present market value and the competition that must be met and overcome in its sale.

Aside from this knowledge, a salesman must have a good address. He must be a fair judge of human nature, optimistic and not easily discouraged. He must use judgment in approaching a customer and display tact in announcing his errand and presenting his business. A man cannot sell to advantage an article with which he is not fully acquainted; but even with this knowledge, his success in securing a good order will depend largely on his knowledge of men and the judgment and tact he displays in the transaction.

A good salesman will recognize that there are times when it is more important to win the esteem and confidence of the man he approaches than to sell him a bill of goods or take his order for a car of coal. He must know the need and be quick to detect the varying inclination of his customer, humor his whims and be interested in his hobby if he has one. By such tactics, an ingenuous salesman will often secure an order where more direct methods would fail. A good salesman, however, will not lead a customer by such methods to order goods he does not need, as the results that are likely to follow will prove as disastrous to the one as to the other of the two parties.

In regard to the preparation for salesmanship, we recommend a practical apprenticeship, which alone can give the necessary experience that will make a successful salesman. Study every feature of the industry. To sell coal, one should know by experience every detail connected with the mining, haulage and loading of the coal at the mine and its transportation to market. Most of this knowledge must be gained underground. He should then become thoroughly acquainted with the business methods in the office of the sales department.

Much can be gained by the study of means and methods, as described from time to time in *System*, A. W. Shaw, publisher, Chicago, Ill. A salesman can secure many good points in respect to advertising features that cannot but be helpful to him by reading the small weekly publication known as *Printers' Ink*, published at 12 West 31st St., New York City.

In the preparation for salesmanship there is much helpful information to be obtained from a book entitled "The Art of Selling," by Arthur Frederick Sheldon. The book is published by the Sheldon University Press, Libertyville, Ill., price $1.25. Another book entitled "Scientific Sales Management," by Charles W. Hoyt, price $2, gives some valuable information in the management of sales departments.

⁂

Tripping of a Circuit Breaker

I would greatly appreciate an explanation of the following trouble: In our mine, when a short-circuit is caused by locomotives or mining machines, it knocks the circuit breaker at the pump motor, should this be running at the time. The result is a big flash, and the commutator of the motor is blistered. At the same time, the circuit breaker in the power plant is tripped, causing a big flash and blistering the commutator of the dynamo. N. Johns.

Beccaria, Penn.

When a short-circuit occurs on a power line, whether this is owing to the haulage locomotives, mining machines or other cause, the result is a drop of voltage over the entire line, owing to the greater rush of current caused by the short-circuit. There may be two cases to be considered: (1) The circuit breaker may be equipped only with an overload release. (2) The circuit breaker may be equipped with a low-voltage release. In the first case, when the short-circuit occurs, resulting in a great rush of current and a drop of voltage, there is produced sparking at the commutator or a big flash accompanied, it may be, by the "pitting" of the commutator. This is not, properly speaking, a "blister," as described by the correspondent, although it may somewhat resemble it in appearance. The sparking or flash is at once followed by the tripping of the circuit breaker.

The same series of events takes place at the pump motor. There is a big flash accompanied by the sparking or pitting of the commutator and the tripping of the circuit breaker simultaneously with the occurrence in the power plant.

This result should not occur, however, if the circuit breakers are equipped with a low-voltage release. In that case, when the short-circuit occurs on the line, the drop of voltage that immediately follows will trip the circuit breakers and prevent the rush of current that would otherwise damage the commutators.

Examination Questions

Tennessee Examination Held at Knoxville, Nov. 23-25, 1915

(Selected Questions)

Ques.—Why is the dust from some coals more dangerous than others?

Ans.—Because of its greater fineness and inflammability, owing to the physical character of the coal and its chemical composition. The fineness of the dust marks the ease with which it is held in suspension in the mine air, in which condition it is more readily acted upon by the flame of a shot or burning gas. Again, some coals contain more bituminous matter and volatile combustible, which render them more highly inflammable than a coal containing less of these constituents. Also, some coals absorb a larger amount of oxygen from the atmosphere, which increases their inflammability.

Ques.—Where are explosions from coal dust most likely to occur?

Ans.—Explosions of coal dust are more likely to originate in proximity to the coal face, especially where mining machines are employed to cut the coal. The reason for this is the greater accumulation of fine dust and the greater emission of gas from the freshly cut coal at the face, in addition to the presence of flame incident to blasting the coal or the possible occurrence of a blownout shot. All these conditions are important features in the origin of a dust explosion.

Ques.—What are the chief factors of danger in coal mines?

Ans.—The chief factors of danger in the operation of coal mines are the liability of injury from falling roof or coal, the ignition of gas or dust, movement of cars, shock from electric wires, the possibility of being overcome by breathing gas or air devoid of sufficient oxygen for the support of life.

Ques.—How does carbonic-acid gas (carbon dioxide) affect the human system?

Ans.—Carbon dioxide is not commonly considered a poisonous gas, but it has nevertheless a distinct toxic effect on the system that is extremely dangerous. The presence of this gas in the air breathed not only reduces the percentage of oxygen below the normal, but its absorption by the blood seriously interferes with the power or capacity of the blood to absorb and carry out of the system the carbon dioxide produced in the tissues of the body as a result of the oxygen conveyed to them by the blood.

It must be remembered that the blood performs a double function—conveying the oxygen breathed into the lungs to the tissues of the body, and removing therefrom the carbon dioxide produced by the combustion going on throughout the body. The effect of carbon dioxide in the air breathed is therefore to derange the human system, first causing headache, then pains in the back and limbs, followed by nausea, prostration and finally death by suffocation when a sufficient portion of this gas is present in the air.

Ques.—How would you ascertain the number of cubic feet of gas standing in an entry?

Ans.—This question must be answered from the standpoint of mining practice rather than in its literal sense. Gas generated at the head of an entry, a few feet in advance of the last breakthrough or crosscut where the air current is passing, has a tendency to accumulate in greater or less proportion at the face of the entry. The percentage of gas in the mine air under these conditions diminishes gradually from the roof to the floor and from the face of the coal outby to the crosscut.

In mining practice what is called "gas" is such a percentage of marsh gas present in the air as will form a cap on the flame of a lamp used for testing. It is customary, therefore, to raise the lamp cautiously toward the roof and note the point at which the cap first appears on the flame of the lamp. If this occurs at 6, 8 or 10 in. from the roof, there is said to be 6, 8 or 10 in. of gas. It may be possible to approach and measure the gas nearer the face of the entry, but as a rule the movement of the person toward the face will disturb the gas so that it is practically impossible to measure with any accuracy the so-called volume of gas accumulated in the entry. The miner, however, reports so many inches of gas, and its volume is estimated by multiplying this number of inches by the width of the entry and that product by the distance from the face to where the gas is found or measured, and reducing this volume to cubic feet.

Ques.—What sources contribute to the heavy loss of coal in mines?

Ans.—The causes of loss of coal in mining are numerous. Probably the lack of a definite plan in the laying out of the mine is the primary cause of the greatest loss of coal in the later development. The failure to adopt a sufficient width of pillar on the main and cross entries and to proportion the width of room pillars to the size of opening, depth of cover, nature of roof, floor and coal, thickness and inclination of the seam, etc., causes great loss in working the coal. The tendency of miners to rob the pillars in the first working causes the loss of much pillar coal when bringing back the pillars. The irregular working of the rooms along a single entry results in some rooms advancing more rapidly than others, which produces a broken line at the face of the coal and brings undue pressure on some of the room pillars, crushing them and increasing the loss of coal in drawing back the pillars.

Ques.—If 15,000 cu.ft. of air and gas at its highest explosive point is passing through a mine what is the quantity of gas given off? What quantity of air must be added to render this current nonexplosive?

Ans.—A mixture of air and marsh gas at its highest explosive point contains 9.46 per cent. of gas; hence the volume of gas given off is $15,000 \times 0.0946 = 1,419$ cu.ft. per min. The volume of air and gas when this is, say a 2-per cent. mixture is $1,419 \div 0.02 = 70,950$ cu.ft. and the volume of air to be added is therefore $70,950 - 15,000 = 55,950$ cu.ft. per min.

Book Reviews

Text Book on Assaying

A TEXTBOOK OF PRACTICAL ASSAYING FOR THE USE OF MINING SCHOOLS, MINERS AND METALLURGISTS. By James Park, professor of mining, Otago Universiity, director of the Otago University School of Mines, New Zealand. Revised from 3rd New Zealand edition. J. B. Lippincott Co., Philadelphia, Penn. Cloth, 5¾x7¾ in. pp. xii + 335 + 7 index, 17 illus.

A reliable, but elementary, book on the subject of analyses of all kinds including even soils, manures, oil shales, alcohol, sugar and milk. There are 18 pages on the proximate analyses of coal, its calorimetric measurement and the determinations of sulphur and phosphorus. The chemist is supposed to obtain results comparable with his fellows, and it is best therefore for an American to follow recognized American methods. The moisture and volatile matter in coal as determined by analysis are not absolutely definite quantities, but will vary a little with different methods of determination. It is best therefore to follow arbitrary practices in common with other American analysts and not to imitate the methods of foreign assayers until those methods are adopted by other American authorities. If real accuracy is sought, then methods must be adopted such as are described in the report of the Committee on Coal Analysis of the American Society of Testing Materials and the American Chemical Society.

Following an English custom which perhaps dates back to a time when the whole truth of the matter was not apprehended, the author designates as "volatile hydrocarbons" what in America we term "volatile matter." H. C. Porter, of the United States Bureau of Mines, recently stated: "From some bituminous coals, completely dried, we obtain by decomposition as much as 10 per cent. of noncombustible volatile matter and from some lower-grade coals even as much as 15 or 18 per cent. So there can be no question that the term 'volatile combustible matter' as frequently used is decidedly a misnomer." The term "volatile hydrocarbon" makes this same false assumption and regards the product of "distillation" of coal as consisting entirely of compounds of hydrogen and carbon, whereas water is invariably present.

An Elementary Text Book

AN INTRODUCTION TO MINING SCIENCE. By J. B. Coppock, associate of Nottingham University College, and G. A. Lodge, lecturer on mining and mine surveying at Huddersfield Technical College and Batley Technical School. Cloth boards; 4⅞x7 in.; pp. x + 226 + 4 index. 102 illus. Longmans, Green & Co., Fourth Ave. and Thirtieth St., New York City. (Longmans Technical Handicraft series.) 60c., net.

There have been a large number of books published purporting to give just the information needed to secure a mine foreman's certificate—just that and no more. Sometimes questions from actual examinations are given with their answers, so that the reader is assured that he is wasting no time in the studying of matters which are not necessary. Like the foreigner, posted by the astute politician and preparing to attest to the judge that he is fit for citizenship, the would-be mine foreman is prepared for the ordeal of examination by such books as those just described. With such an irreducible minimum, with such cramming without thought, what wonder is it that the students so often fail to pass! They forget what they have been told and do not have the power to reason for themselves.

Cramming May Suit the Pupil, But Not the Industry

Perhaps, however, cramming is all right for the man who wants the certificate, but certainly not for the man who would hire the certificated man. The company which deliberately starts a school to cram scholars for mine foremen is riding to a fall. A company school should give the broadest kind of instruction, and then if a man passes his examination he is sure not to have merely a minimum qualification of knowledge, but an abundance of needful fact and a logical basis of reasoning. After all, the mine foreman's certificate is not the end-all and be-all of mining education as some believe.

This little book—always elementary, always thoughtful and (what is more) always correct—leads carefully from the known fact to the unknown and draws from the pupil a thoughtful consideration of the laws of nature in their relation to mining. However, the experiments described are many, and a certain amount of paraphernalia is necessary to demonstrate the course to the students. But surely every company can afford the small amount of chemicals, the bell jars and flasks which the authors require.

The subjects treated are: Combustible and Incombustible Substances; Air, Its Constituents and Its Actions; Air Currents and How They Are Caused; Increase in Size of Substances by Heat and Its Applications; Principle of the Safety Lamp; Mine Gases Known as Damps; Substances Which, Mixed with Air, Form Explosive Mixtures; Flames, Their Shapes and Parts; Ways of Producing Heat and Light; Inflammability of Substances; Substances Containing Fixed Oxygen; Diffusion or Movement of Gas Particles; Substances and Their Changes; Coal, Its Nature and Origin.

Both Miner and Mine Foreman Need Training

Every opportunity is taken to point the relation of the scientific facts established to the needs of the mining man. The training given here is such that it will be a pleasure rather than a burden when the day's work is done, and it is likely to form the matter of conversation between the pupils.

But the book gives no mathematical discussion of mine gas, ventilation or haulage, and of course the mining law is not touched. It is an introduction and only an introduction to mining science. Nevertheless it is such a pleasant pathway to the study of mining that even those who are not thrilled with the hope of attaining the dignity of mine foreman will desire to know what it has to teach and will find it of use to them in their daily vocations. And after all we waste too much effort on making mine foremen. There are other men who need to know something about the tools they use and the dangers they face and the laws natural and arbitrary by which they are governed. These also will be appealed to by these interesting lessons.

A Cambria County Coal Map

MAP OF CAMBRIA COUNTY, PENNSYLVANIA, SHOWING MINES, COAL AREAS, BASINS, RAILROADS, TOWNSHIPS AND COAL-MINING STATISTICS. By Andrew B. Crichton, civil and mining engineer, Johnstown, Penn. Map 36x39-in. Key sheet 16x32 in. Price, $2.

This map of wall size will be found of much benefit to all who have interests in Cambria County. It gives the locations of all the mines, towns, township roads, streams, township boundaries, anticlines, synclines and reservoirs. The key sheet, or supplement, shows the 212 mines, their names, operating companies, the addresses of the same, their general superintendents, their addresses, the number of employees, the seam worked, its thickness, the kind of opening, the shipping railroad, average daily output in 1912, in 1913 and in 1914, the inspection district and other annotations.

Cambria County coal was first used in 1822, yet in 1840 only 41 men were employed in the county. But in 1914, 25,787 men were working at its mines and producing 16,571,359 tons. In the year before there were 23,277 men and the tonnage was 19,265,395. The year 1914 was a distinctly unfortunate year for the miners of Cambria County, only 206 days being worked as against 268 in the year before.

All the coal in Cambria County is low-volatile in character because by far the greater part of the county lies southeast of the Laurel Ridge, or first anticlinal. Much of the coal lies well under cover, and when this is worked, as it certainly will be because of its excellent qualiity, Cambria County will put out a much larger tonnage even than today. In the whole county there are only 17 shaft operations and 44 slope mines, the other 151 operations being by drift. Of all the mines, 1 is in the A bed, 85 are in B, 3 in the rider of B, 3 in C, 36 in C', 44 in D, 39 in E and 2 are unknown. It is evident that the B bed takes the lead, and this is largely because of its excellent quality. The D bed is often sulphury in that county, while the C', which in most of the counties of Pennsylvania is a worthless, completely negligible bed, in Cambria is a seam of remarkable value. The leadership of Cambria County as a coal producer is derived from its comparative nearness to the Eastern market and the excellence of the fuel mined.

Coal and Coke News

Washington, D. C.

In his annual report just sent to Congress, the Secretary of the Interior has given a thorough review of the work of the Bureau of Mines for the past year, as well as an outline of the Alaska situation, with reference to coal mining. The report furnishes much hitherto unpublished information regarding the operation and problems of the Bureau.

With reference to the Alaska situation the report says:

Coal Areas—Surveys of the coal areas in Alaska, in the Bering River, Matanuska and Uenana regions, together with classifications of the coal lands and reconnaissances of certain areas for reservation for the use of the Government, as provided by act of Congress, were begun during the past summer. Tests of the Matanuska coal for steaming purposes were made during the year under the direction of the Navy Department, and the coal was found eminently satisfactory. The coal now consumed in the Territory continues to be imported, a considerable portion of which comes from British Columbia. A decrease in the consumption of coal is noted, due to the greatly increased use of fuel oil in the Territory. Three patents of coal lands were issued during the fiscal year. The importation of coal into Alaska from the States and from foreign countries during the last fiscal year amounted to 79,239 tons, valued at $397,290. Of this 32,927 tons, valued at $141,480, was foreign coal, and 46,312 tons domestic, valued at $255,810.

HARRISBURG, PENN.

Despite the fact that both the anthracite coal carrying roads of this state and the coal operators as well asked for a rehearing with reference to the rates for "cereal" sizes of coal, fixed last June, the Interstate Commerce Commission on Dec. 6, decided not to grant such a rehearing.

The present rates will stand. The commission made no comment in denying the petition for a rehearing, but evidently takes the position that nothing has been presented to warrant a rehearing or a revision of the existing rates.

The so-called "cereal" sizes of hard coal, including rice, barley and buckwheat, are being shipped under the schedule of rates fixed by the commission some months ago. There was a hearing on the petition of the coal operators from the state for lower rates last summer and concessions were granted by the commission, the various rates being lowered, but not as much as the operators desired.

The coal operators and the railroads both petitioned for a rehearing, the one side asking an opportunity to show that still lower rates would be justifiable and the other seeking to show that present rates were unprofitable and that higher rates should be restored.

It was decided that there should be no reopening of the anthracite coal cases. Although the railroads claim that they are carrying the coal at rates that are unprofitable, this decision makes it certain that they must continue to carry the sizes of coal that have been under consideration at the rate now in effect.

Is There To Be Discrimination

The State Compensation Board on Dec. 9, adopted a ruling which will require employers seeking exemption from the necessity of insuring their compensation liability to declare whether they will discriminate against a married employee or one with a large family in favor of an unmarried employee or one with a small family. A ruling was also adopted that the board will require a statement whether discrimination will be made against an American in favor of an alien employee and whether any discrimination will be made against a man on account of his age when he is otherwise qualified.

The Attorney General on Dec. 10, gave an opinion holding that the State Treasurer is custodian of the compensation insurance fund and receipts issued by him for payment made for the use of the fund do not have to be countersigned by the Auditor General; that the bonds shall be made to him as State Treasurer and not to the Commonwealth, and that the State Treasurer may designate the depositories for the fund from the list of banks approved for deposit of state money.

Underwriting of Liability Insurance has Begun

Underwriting of compensation insurance covering the liability of employers subject to the workmen's compensation act of 1915, began in all sections on Dec. 13. The statewide activity in liability insurance will follow by the announcement of the State Workmen's Insurance Board of the rates approved by the Insurance Department.

The approved rates which must be observed by the authorized stock and mutual companies are based on each $100 of annual pay roll, and must be applied only for coverage of compensation liability. The state insurance fund is allowed a 10 per cent. deduction under the rates as approved for stock companies.

The manual to be issued containing the approved rates will be the first to be issued in this state, and will contain a number of rulings regulating the writing of compensation insurance.

Rates on coal mining have not been approved by the Insurance Department. Additional data on the hazard in coal mining is being collected and compiled and these rates will probably be available for distribution about Dec. 22.

Principal operation is the governing classification of its risk. Sub-division will not be permitted, unless separate and distinct enterprises are conducted by the same employer without interchange of labor.

Exceptions are made for executive officers, clerical and office employees, salesmen, collectors and messengers, draftsmen, chaffeurs and chaffeur's helpers.

The minimum premium that will be charged by stock companies and mutual companies is $10, except on contractors risks for which it is $20. Blasting operations require an additional minimum of $25.

Francis H. Bohlen, counsel for the Workmen's Compensation Board, on Dec. 13, submitted an opinion declaring that an employee who has accepted the provisions of the workmen's compensation act cannot bring suit at common law against his employer for a work accident resulting in the mutilation of the employee.

A suit now pending in the Court of Appeals in New York State, in which an employee whose ear was mutilated by a horse he was employed to drive, seeks to recover damages from his employer, is regarded by Mr. Bohlen, at not "even persuasive authority in support of the right of an employee similarly injured to maintain a common law accident in this Commonwealth."

Mr. Bohlen points out that under the Pennsylvania act the employee voluntarily accepts the compensation provisions, while in New York he has now power to reject them. Mr. Bohlen further states that the difference in wording of the Pennsylvania act and the New York compensation act would prevent the decision of the New York Appellate Court even if affirmed by the Court of Appeals, from being applicable in determining the right of an employee under the compensation act.

In discussing the status of the employee under the Pennsylvania law, he says: "The employee agrees to give up his common law rights to recover damages for any personal injury due to a work accident and all the harmful consequence which he suffers therefrom and in return receives a right to the compensation provided in the article. He and his family obtain a certainty of a speedy and fixed compensation whenever he is disabled or killed, in place of his previous right to full damages on the comparatively rarely-occurring occasions when he could prove that the accident was due to his employer's negligence. In return he gives up not only his right to full damages for those harms for which compensation is provided, but also all right to any compensation or damages for those infrequent harmful consequences such as mutilation and disfigurements which do not entail loss of earning power and so are not the subject of compensation. It is therefore clear that the sole remedy of any employee who has agreed to accept the compensation provisions of article 3 is under that article and that he can maintain no action at common law for any harm resulting from a work accident whether covered by the compensation schedules or not. There is therefore no right of action at law to recover damages for mutilation or disfigurement not causing disability for more than 14 days. An employee so mutilated is only entitled to the medical, surgical and hospital services which the employer is required by section 306 to supply him and if these are refused and he is forced to provide for himself, his sole remedy is by petition to the Workmen's Compensation Board under section 412 of the Compensation act.

PENNSYLVANIA

Anthracite

Tamaqua—Car shortage due to embargoes and increased freight shipments of other than coal, is causing a serious curtailment in the production this month. Fourteen of the 16 Lehigh Valley Coal Co.'s collieries in the Mahanoy region were compelled to go on short time recently because of car shortage.

Mauch Chunk—During the past week the Lehigh Coal and Navigation Co. has experienced considerable difficulty in securing an ample supply of labor with which to continue the extensive stripping operations which it has under way in various parts of this county.

Duryea—Independent operators who purchased the Bowkley tract of land in this section are making preparations to mine the coal. Drifts have been driven at a point west of Main street and a short distance south of the Lehigh Valley Coal Co.'s Seneca colliery, toward Main street, where the Checker vein is located. The coal will be prepared at the Seneca Colliery which is only a short distance away.

Shenandoah—Many collieries in the Shenandoah Valley were compelled to suspend all operations one day last week for want of railway cars. Thousands of men were made idle.

Jessup—The Dolph Coal Co.'s breaker and boiler houses, one of the best equipped in the Lackawanna Valley, burned on Dec. 11, entailing a loss of $150,000 and throwing 800 men and boys out of work. The breaker was comparatively new, replacing one burned a few years ago. This is the third coal breaker burned in this section within two months.

Dupont—The two public schools of this town, were closed on Dec. 8, on account of surface subsidence. Several homes in the immediate vicinity of the schools were also affected. The cave is believed to be due to disturbances in the workings of No. 2 Heidelberg Colliery. The foundations of the buildings were cracked and the plaster shaken down and the structures thrown out of plumb. One of the buildings is practically a wreck.

Plymouth—The compressor pipe line at Lance No. 11 Colliery of the Lehigh & Wilkes-Barre Coal Co., burst on Dec. 9, and for a time consternation reigned. The pipe line leads down the shaft to the air locomotives and pumps and was carrying a pressure of 850 lb. A length of pipe with an elbow attached was blown across the street, tearing down the fences, poles, telephone and street railway wires. The force of the concussion was so great that the report was heard a mile away and many feared that an interior explosion had occurred.

Laurel Run—The fire which had been raging in the No. 2 colliery of the Red Ash Coal Co. for several days, and which caused thousands of dollars worth of damage, was extinguished on Dec. 9. Water was used to fight the flames. Pipe lines were laid into No. 2 slope and a large force of men were put to work day and night. The cause of the fire is not known.

Bituminous

Connellsville—Two hundred and forty-nine additional ovens were recently put in blast in the Connellsville region, the weekly coke production being now approximately 437,000 tons. The total number of ovens now in operation is about 32,000.

Portage—The local plant of the Miller Shaft Coal Co. was recently compelled to suspend operations as the result of an accident. The breaking of the "bull" wheel allowed the cages to drop to the bottom of the shaft, resulting in their destruction. No one was injured. The cause or reason for the failure of the wheel is not known.

WEST VIRGINIA

Charleston—Fifty-five fatalities in the coal-mining industry were reported to the State Workmen's Compensation Commission for November; 23 of these were caused by the explosion at Boomer the last day of the month. Aside from these the number of deaths for November in all industries was the same as in October, being 40.

A mine-rescue car for the State Department of Mines is proposed. The need of this car has been pointed out by Earle Henry, chief of the Department of Mines, who states that there are 1,100 mines in the state, employing 80,000 men. It is said that had such a car been in use at the time of the Boomer disaster, fewer fatalities would have been the result of the explosion, as it is believed that such a car could have reached the scene in time to have saved many lives.

Gary—The United States Coal and Coke Co. is advertising for more men. This firm is attempting to increase the output of its coke ovens to 2,500 tons per day. It is in need of coke-yard men, coal miners and coal loaders, to the number of about 500.

Phillippi—Improvement in the coal and coke industries of Barbour County continues. The Junior mines, which were closed for a year, are now operating up to the car supply, and more workmen are needed. The coke ovens at this plant have also been fired. The Gage Coal and Coke Co. has fired the 60 ovens at the company's plant. Scales for weighing the mine cars have been installed and the men are now paid by weight instead of by the car, as formerly.

KENTUCKY

Whitesburg—Reports from the Letcher County coal field are to the effect that mining operations have been making a continued increase during the last several weeks, while further increases are said to be planned by all the operating companies. The railroads report an increase of nearly 40 per cent. in coal shipments in the last month and improvement of trackage and equipment is in order.

Providence—The Lamb Coal Co. is opening a new mine at Wheatcroft. The shaft adjoins the Illinois Central R.R.

OHIO

Columbus—Miners in western Pennsylvania, Ohio, Indiana and Illinois have asked the operators in the four states to meet in informal conference for the purpose of discussing the question of reviving the four-state wage agreement. So far the operators in Ohio have not expressed a willingness to meet in conference with the miners. Some time ago when Ohio operators were sounded on the question the opinion was almost unanimous that Ohio would not join the other states in the agreement and it is doubtful if operators in other states want the four-state agreement revived.

Stripping operations in Jefferson County, Ohio, are proving successful. The Piney Fork Coal Co., which has offices in Columbus will soon be in a position to load coal at its new operation along the Wabash R.R. The gigantic electric shovel has been installed and the past two weeks has been devoted to removing the earth from the coalbed. It is believed that coal will be loaded by Dec. 15. The Modern Coal Co., which is a subsidiary of the Hocking Fuel Co. has been loading at its stripping operation at Parlette, Ohio for more than a month. The output up to date is in excess of 8,000 tons and the daily capacity is now about 500 tons. Pennsylvania capitalists have started a stripping plant in the same section.

Athens—An order has been issued by the State Industrial Commission's Department of Mines requiring all Ohio mine operators to install a system of checking the employees, as a matter of safety. Checks are to be issued to all persons entering a shaft mine, which must be given up and preserved when they leave, thus forming a record. An order was issued in May suggesting such a system for all shaft mines and all other mines generating gas.

Bellaire—The new mine of the Morgan Coal Co. at Bannock is ready to start operations and will begin working as soon as power can be secured. The company has a contract with the Sunnyside Electric Co. for furnishing power, but the wiring has not been completed. The Morgan mine, at Edge Hill, is still operating, although it will soon be exhausted. The machinery and equipment will then be transferred to the Bannock mine.

ILLINOIS

Duquoin—Depositors of the defunct private bank of Henry Horn, coal operator, have been notified that the trustees of the estate have realized enough from the sale of property to pay a 20 per cent. dividend early in January. This means that about $60,000 will be distributed.

Johnson City—Installation of equipment at the Stiritz mine near here has been completed and operation has begun. The company is composed of local men, headed by City Treasurer A. C. Stiritz. The shaft is located on the old Stiritz homestead.

IOWA

Des Moines—Ten first-aid teams of six men each have been organized by J. J. Forbes, representative of the bureau of mines. This marks the first permanent organization effected in any county of district No. 13, which comprises all of Iowa and northern Missouri. Mr. Forbes has concluded his safety-first campaign at the Iowa Industrial Hospital, but will keep in touch with the teams and return to Des Moines from time to time.

Iowa coal mines are now being operated only 80 per cent. of the time. Most of them are open only five days a week.

according to mine inspectors in conference here. Mild weather has decreased fuel demands. As a general rule the mines are running full blast the early part of December.

WASHINGTON

Zillah—A discovery of coal about 2 mi. from town recently caused the Northern Pacific R.R. to send its experts here to make surveys and tests with a view of securing a new supply for trains.

FOREIGN NEWS

Zurich, Switzerland—Reports reaching here from Austria are to the effect that the supply of coal in Vienna is so small that the question of lighting the city has become acute. The Burgomaster has appealed to the Governor to provide coal for the municipal gas works, so that the capital may not be left in darkness. The city of Laibach and Styria, it is reported, already are without gas on account of the lack of coal.

PERSONALS

E. L. May has severed his connection with the West Virginia Coal Co., to join the selling force of the St. Louis Coal Co.

Paul Bray, recently assistant sales manager for the Joe Taylor Coal Co., St. Louis, Mo., has gone over to the selling force of the Briquette Mfg. Co.

F. L. Swanson, formerly associated with the Kerens-Donnewald Coal Co., has allied himself with the selling force of the West Virginia Coal Co., of St. Louis, Mo.

John J. McDonald, at Hannastown, Penn., was recently appointed mine inspector of the Greensburg District, succeeding D. J. Blower. Mr. McDonald has for many years been the mine inspector of the Jamison Coal and Coke Co.

John Bradwell, of Nesquehoning, Penn., who has been in the employ of the Lehigh Coal and Navigation Co. for 65 years, has been retired by the company on a pension. At the time of his retirement he was assistant mine foreman.

D. J. Stoddard, for several years manager of the People's Mine at Lebanon, Ill., has been promoted to the newly created office of mine superintendent and is succeeded as manager by Thomas Jones. Heretofore Stoddard has acted as both manager and superintendent.

Maj. E. C. Camp, of Knoxville, Tenn., president of the Coal Creek Coal Co., at Coal Creek, Tenn., has been chosen by the Tennessee delegation to the National Rivers and Harbors convention now in session at Washington, D. C., as their candidate for vice-president of that organization.

George W. Fleming has been elected president of the Elkhorn Coal Corporation, which was recently formed by the merger of the Elkhorn Fuel Co., the Elkhorn Mining Co. and the Mineral Mining Co. The firm of which Mr. Fleming is president will operate a large coal tract in the eastern coal fields of Kentucky.

R. H. Buchanan, at present superintendent of the Pine Hill Coal Co.'s colliery at Minersville, Penn., has resigned and it is reported that on Jan. 1 he will enter the employ of the Delaware & Hudson Coal Co., at Scranton. A number of mining men from the Schuylkill County field have taken positions with this company during the past year.

F. Peiter has severed his connection as coke-oven engineer with the Gas Machinery Co., of Cleveland, Ohio. For three years past Mr. Peiter has been engaged in designing and developing the top-burner regenerative coke oven for the Gas Machinery Co. Previous to this association, he was connected with the H. Koppers Co. as designing and constructing engineer. Mr. Peiter has several connections in view, but will take a rest before assuming other responsibility.

General Superintendent William Reinhardt, of the Mineral Coal and Mining Co., at Shamokin, Penn., it is reported will retire from the service of that company on Jan. 1. With his retirement a change in the official personnel of the Mineral company's collieries will be made. Superintendent Auman, of the Lykens-Williamstown district will succeed Mr. Reinhardt, Superintendent Randall, of the Lytle colliery, at Minersville, will go to the Lykens field, A. E. Van Horn, superintendent at William Penn colliery goes to Lytle, while David Williams, at present an official in the Susquehanna field of that company, will succeed Mr. Van Horn.

OBITUARY

William A. Conner, of Plainfield, N. J., died recently at his office in Perth Amboy. Mr. Conner was born in Baltimore in 1859, beginning his business career in Pittsburgh in 1876 in the oil-refining business, in which he later reached the position of assistant manager of the Standard Oil Co. In 1885 he took charge of the first plant built by the Standard Underground Cable Co. in Pittsburgh, and from then until the time of his death he was the head of the manufacturing business of that company, including large plants planned and built by him in Pittsburgh, Penn., Perth Amboy, N. J., Oakland, Calif., and Hamilton, Ont. He has resided in Plainfield since 1904. Mr. Conner, who was a relative of O. G. Waring, of the Standard Oil Co., E. J. Waring, of the Standard Underground Cable Co., and of the late Richard S. Waring, founder of the Standard Underground Cable Co., is survived by a widow, a brother and a sister.

INDUSTRIAL NEWS

Philadelphia, Penn.—The Philadelphia & Reading Ry. in November hauled the largest tonnage of anthracite coal in its history, for that month, 1,163,851 tons, which was an increase of about 30,000 over the previous best November, that of 1911.

St. Louis, Mo.—The Laclede Steel Co., of this city, has purchased the plant of the Alton Steel Co., of Alton, Ill., which was sold recently to Pittsburgh interests under a foreclosure sale. The plant will resume operations Jan. 1, with about 400 men.

St. Louis, Mo.—Increased rates ranging from 3 to 20c a ton on coal in carloads over the Missouri Pacific Ry. from producing points in southern Illinois to stations in Missouri were recently suspended by the Interstate Commerce Commission until Apr. 13.

St. Louis, Mo.—A bill was presented recently before the Board of Aldermen, seeking to supplant the present system of municipal inspection and weighing of coal, eliminating the city weight tickets costing 3c. each required with each load. If enacted into law, it will save to the coal dealers about $30,000 annually.

Terre Haute, Ind.—The Indiana Gas and Coke Co. has let the contract for its plant to the Gas Manufacturing Co., of Cleveland, Ohio. It will represent an expenditure of $750,000 and will have 30 ovens. The subcontract for the coal and coke handling machinery has been awarded to the Heyl & Patterson Co., of Pittsburgh.

Charleston, W. Va.—Harrison B. Smith, Buckner Clay and others, of this city, have organized the Mann's Creek & Meadow River Ry. Co., for the purpose of constructing a line of railroad from Ephraim's Creek to Brackin Creek, in Fayette County, tapping an extensive coal field. The company is capitalized at $100,000.

Whitesburg Ky.—The Consolidation Coal Co., of Jenkins, which is supplying all the near-by operations with light and power, is building transmission lines from Wayland and Garrett, on Beaver Creek, via Lackey, Beaver and Harold, to Pikeville, Pike County, to a connection with the transmission lines there from Jenkins.

St. Louis, Mo.—The Interstate Commerce Commission has set Dec. 27 for the taking of testimony in the case of the Coal Operators Traffic Bureau of St. Louis vs. the Terminal R.R. and other carrier defendants, alleging an overcharge of 5½c. per ton on all soft coal originating in Illinois and delivered in St. Louis between the dates of Feb. 1 and Sept. 30, 1915.

Wheeling, W. Va.—It is stated that actual work has begun on the erection of a power plant at Beech Bottom. It is stated that this generating plant will be second only to the power house at Niagara Falls and will, when completed, be in a position to furnish the entire section with power. It is further stated that an electric railroad will be built to the coal fields of Pennsylvania.

St. Louis, Mo.—A traction line from Bicknell, Ind., in the Knox County coal fields to Evansville, Ind., is being planned, and it is said the line will be surveyed in a short time. A Cincinnati concern is building a $100,000 power plant at Bicknell to supply the city and the coal mines with power, and it is said the plant will also furnish a part of the power for the new traction line.

Ramy, Penn.—T. E. Womelstorff and G. F. Dunkle, operating under the name of the Bermosham Coal Co., recently purchased the Eureka No. 16 Mine from the Berwind-White Coal Mining Co. This firm is operating in the Moshanon seam of coal. The present output is about 100 tons per day, which it is proposed to increase as rapidly as possible. Later on, the B or lower seam will be developed.

Buffalo, N. Y.—A final test of the new McMyler box-car loader was recently made at the coal docks of the Lehigh Valley company here with what appears to have been entire success. Being a new invention the work was slow and it appears to have been perfected only for work on the last Lake cargo of the season. In case it is found to work satisfactorily all work of loading in the Lake trade will be done by it.

Reading, Penn.—The Reading and the Pennsylvania railroad companies have been storing large quantities of bituminous coal for the past two months. The Reading has dumped several thousand tons and a large number of cars have been sidetracked in the vicinity of the water station. This fuel is stored to guard against a sudden change in the weather which would render shipments from the mines uncertain.

Brookville, Penn.—The Pawnee Coal Co., recently incorporated and having large holdings in Knox Township, Jefferson County, Penn., is working out preparations which will, if carried out, eventually make it one of the most important independent concerns in this immediate section. Power plant machinery is being installed and coal cutters will be added shortly. An output of 500 tons per day is anticipated in the near future.

Uniontown, Penn.—To take the place of men which it cannot secure, the Oliver & Snyder Steel Co. is installing two Covington coke-drawing machines at its No. 2 plant. The company has been unable to secure enough men to operate 275 of the ovens. These machines can each pull 40 ovens per day. The plant has been operating six days per week and at the greatest capacity which the limited number of men available would permit.

Harlan, Ky.—The White Star Coal Co. has been organized it Wilhoit, near here, in the Harlan County coal fields, by Major Moss, R. B. Moss, M. J. Moss, Jr., W. L. Moss and R. L. Phillips, all of Pineville, for the purpose of starting work immediately on a coal development near Wilhoit. It is expected, also, that the company will take over the Moss Coal Co., at Wilhoit. The company plans a daily capacity of about 2,000 tons. Mines will be electrically equipped.

Birmingham, Ala.—It is stated that in order to meet the demand for coal resulting from the blowing in of numerous furnaces in the Birmingham district, five new coal mines will be opened in Bibb County in a few weeks. Definite plans have been made by the Coyle Coal Co. for the expenditure of several thousand dollars in the opening of the new mines, the exact amount of which cannot now be determined. The work of erecting the new plants will begin immediately.

Buffalo, N. Y.—With the close of the Lake season the shipping trestle of the Delaware, Lackawanna & Western company will be abandoned and torn down, in accordance with the order of the Secretary of War, to make way for a dump and car loader that will obstruct navigation less. A tariff has been issued for continuing shipments over the Erie Railroad trestle, as the company commonly continues to load storage coal during the winter, for shipment next season.

Cleveland, Ohio—Officials of the Pursglove-Maher Coal Co. and of W. H. Warner & Co., recently announced that they had purchased jointly a coal dock at Superior, Wis., known as Dock No. 4. This dock was purchased from the Reiss Coal Co., of Sheboygan, the site being owned by the Northern Pacific Ry. The Cleveland firms will take possession of the property in May, 1916. This dock has a capacity of 300,000 tons per year and will enable the two concerns to enter a new market.

Charleston, W. Va.—A decree foreclosing a mortgage on the properties in this state of the Paint Creek Collieries Co. and ordering a sale of the holdings for the benefit of bondholders, was recently entered in the United States district court by Judge B. F. Keller. The Scranton Trust Co., of Scranton, Penn., which petitioned for the decree, alleged that the company had defaulted in the payment of interest on $3,000,000 of first-mortgage bonds. No date was set for the sal of the property.

Benton, Ill.—The Illinois Central R.R. Co. is seeking by quo warranto proceedings to get control of a charter granted the Toledo, St. Louis & New Orleans R.R. and the Gulf Line Connecting R.R. of Illinois, to enable the construction of a 100-mi. railroad from Metropolis to Grayville, which would afford an outlet for the big coal fields of that section. The Illinois Central is said to contemplate the expenditure of approximately $3,000,000 on the road. It is hoped to start work early in the spring.

Pittston, Penn.—James White and Theodore Hogan, independent coal operators, have driven a drift into the Checker vein on the old 60-acre Bowkley tract, in Upper Pittston, preparatory to mining operations. The Checker vein and splits from the Red Ash and Marcy underlie the tract. The coal will be sold to the Lehigh Valley and will be prepared at the Senaca breaker, only a short distance away. Much of the mineral in the Checker vein is virgin coal, but the operations in the other measures will be remining.

Cleveland, Ohio—The most important deal put through since the scramble for bulk freighters was started by the Great Lakes shippers and consuming interests more than a month ago was closed when the Cambria Steel Co. and M. A. Hanna & Co., jointly bought four 10,000-ton steamers from the Frontier Steamship Co., of Tonawanda, and one steamer of the same class from the Niagara Transit Co. of the same port. The price paid for the ships was not given out, but it was believed to be something more than $1,500,000.

Ethel, W. Va.—The Rex Coal and Coke Co.'s mine, at Ethel, W. Va., was sold Dec. 6. The new company will operate under the name of New Rex Coal and Coke Co., and will be managed by the following men: L. R. Reese, president, Huntington, W. Va.; J. F. McClung, vice-president and general manager, Ethel, W. Va.; George S. Wallace, secretary and treasurer, Huntington, W. Va. This mining property is known as one of the very best in the Logan field. Negotiations for the sale were conducted by Karl F. Schoew, consulting mining engineer and coal-land broker, of Huntington, W. Va.

Buffalo, N. Y.—The Donner Steel Co. has been incorporated, with a capital stock of $5,000,000, to take over and operate the blast-furnace plant of the New York State Steel Co. The plant, which is to be extensively enlarged, will use large tonnages of coal and coke. The present blast furnace and openhearth furnaces and the blooming mill will be started about Jan. 15, as soon as necessary repairs can be made. Mr. Donner, president of the company, states that a new blast furnace will be built at once and that the company also plans to build a byproduct coking plant to cost $1,500,000.

St. Louis, Mo.—Railroads operating eastward from St. Louis report that the volume of traffic exceeds nearly all periods in which comparisons should be made and that the diversification of freight is now greater than for several years. The westbound movement of freight which has lagged for more than a year is now again about normal. Western roads for the past week report gains ranging as high as 65 per cent. in some commodities over a year ago. The gains in all classifications reflect a sharp betterment. Southern roads report improvement in all classifications of freight. Business is picking up rapidly. Grain, principally corn, is moving freely.

Philadelphia, Penn.—Local exporters of bituminous coal have had their attention called to the extreme shortage of fuel in Italy. The prices have soared rapidly in the past few weeks until $40 has been asked for a ton. It is understood the Italian Government is having considerable difficulty in keeping the various public utilities, such as water-works, lighting plants and gas concerns, in operation. Inasmuch as Italy has no coal mines, it is dependent on other countries and since it became involved in the war the only supplies have been coming from England and in a small measure from the United States. Those consulted in the trade here can hold out but little encouragement of increased shipments from this country, due to the greatly increased consumption at home and also owing to the lack of ships in which to carry the coal.

Uniontown, Penn.—The Tower Hill-Connellsville Coke Co., its receivers, L. W. Fogg, G. S. Harah and John R. Thompson, and the Citizens' Title and Trust Co., of Cleveland, Ohio, are made defendants in a proceeding instituted before Judge E. H. Reppert. J. P. Nutt, Andrew Squire and Philip A. Meyers, holders of general mortgage and improvement bonds of the coke company, have filed a petition praying for the foreclosure of the mortgage given to protect bondholders. The action arises from the failure of the company to meet the last two semi-annual payments of interest on its bonds which were issued Sept. 1, 1910, to the amount of $1,000,000. Under the terms of the mortgage, holders of 25 per cent. of the bands issued can take steps to foreclose in event of default in payment of interest. The petitioners in the present action allege that the trustee has, after due notice, failed to act, and the bondholders named now appeal to the court for enforcement of the provisions of the mortgage. An answer to the petition must be filed within 30 days.

Coal Trade Reviews

General Review

Severe weather precipitates a rush for anthracite. Speculative element in control of the bituminous market and spot tonnages commanding high prices. Coal famine in parts of Europe.. Middle Western steam coals make substantial gains and there is considerable stocking.

Anthracite—Storms and lower temperatures, particularly severe at the opening of the week, interrupted deliveries, and caused a heavy influx of rush orders. The situation is decidedly strong, and shows every indication of gaining momentum as the season advances. Pea coal continues the leader, with prices at a high level, and consumers crowding the producers for maximum tonnage. Steam sizes, acting in sympathy with the rapid advance in bituminous, are firmly established at full circular prices, or better, with buyers showing more interest each day. Lake shipments wound up with a rush though the gross tonnage for the season showed a loss, due to the lack of storage room at upper ports.

Bituminous—The soft-coal market has developed into a highly speculative proposition, coal at destination ready for unloading, frequently changing hands several times. The situation is marked with a certain tenseness, as is evident by the fact that large consumers are sending representatives into the mining regions to look up extra tonnage, and by the further fact that there have been tentative negotiations on Pittsburgh coal for delivery at Tidewater points. Prohibitive coastwise freights have diverted considerable business to the Pennsylvania all-rail fields and there is a marked anxiety among consumers at Down East points. Some exceptionally high prices have been done in the spot market on Southern coals, but there is only a meagre tonnage available for such business.

Export—Foreign cables report fabulous prices, and impending coal famines in certain of the nonproducing European states, in spite of which the export movement is constantly receding. The situation is aggravating in the extreme to prospective exporters, and it is difficult to foresee any relief. Each week sees vessel rates marked up to new high levels, and foreign shipping has been confined for some time to contract obligations. Evidence of the restricted market for export fuels is seen in many directions; so much surplus West Virginia coal has been diverted to the Middle West that these grades are noted for their heaviness in an otherwise uniformly strong market, while tonnage statements of the Tidewater coal roads show significant losses, both in the movement and loading at Hampton Roads.

Ohio Valley—The lower temperatures have had a beneficial influence on the local market, though there is no appreciable increase in the business. Further expansion in manufacturing demand, and Eastern inquiry for Pittsburgh coal at Seaboard points, are constructive factors indicating an expanding market, though the demand from these sources has not been in sufficient volume to materially affect the situation. The car shortage remains an important influence in the market; Ohio roads are apparently much better equipped in this respect, and consumers of West Virginia coal are beginning to divert some of their business to operators in the former state. Lake insurance expired at midnight, Dec. 12, and the shipping season is now definitely closed.

Middle West—There is further evidence of increased strength on the steam sizes, prompt tonnages commanding substantial premiums, and indications pointing to higher price levels on these grades than for several years. Manufacturing and railroad interests are taking heavy tonnages, and industrial plants having orders for their products well ahead, and now taking energetic measures to insure their fuel supply. Occasional concessions are noted, but on the whole, the circulars are well supported. Relatively mild weather in the extreme Northwest has restricted domestic buying, though prices remain firm. The expected relief from the car shortage, resulting from the release of equipment used in the Lake trade, has not had time to materialize, though it is noted that the shortage is a trifle less stringent at the moment.

A Year Ago—Cold weather causes a sharp advance in anthracite, though the wholesale market continues heavy. Bituminous operators still pushing vigorously for business. What few changes there are seem to be of a constructive nature.

BUSINESS OPINIONS

Iron Age—Current market reports still deal largely with business offered, which steel companies cannot entertain. Yet in November, when a similar condition prevailed, actual bookings were enormous, as the Steel Corporation's increase of over 1,000,000 tons in unfilled orders is full proof. Some independent companies also booked nearly as much as they shipped last month, but others kept their new contracts down. The outcome of the railroad congestion, particularly in the East, is a matter of no small concern. Iron ore, pig iron and finished materials have been active in the past week in the order named.

Boston News Bureau—It would be difficult to imagine a situation more difficult to diagnose. Now it is the Austrian note, and there are serious potentialities regarding this. But it has been a question of notes for a long time without any important results. There is, however, a more or less indefinite feeling as to the future. There is certainly no greater evidence of peace. There is no longer any doubt as to our business recovery. The improvement is evidently here to stay. When our defence program is started the incentive to much greater activity will be at hand.

Dun—There is no longer complaint of deferred buying, but of difficulty in meeting the steadily expanding requirements. Consumptive demand exceeds supply in some lines and distributing channels are obstructed by the congestion of freight, rail and oversea shipping facilities still being inadequate to cope with the rush of traffic. Evidence of a further recovery in the building industry is provided by the building permits taken out during November, the total from the building departments of 79 leading cities in the United States calling for the expenditure of no less than $56,339,078, an increase of 70.3%, as compared with the $33,073,525 reported for the same month last year. The gains made in November and in the two preceding months have more than made up for the falling off in the earlier months, and the total is not only greater for the year to date than in 1914, but is also well up to that of the active year 1913.

Bradstreet—All reports agree that movements are smarter than they have been at this season for three years past, and in some aspects the situation excels the flush times of December, 1906. Activity covers a multiplicity of lines; whereas this season of the year usually finds wholesale trade quiet, with inventories either under way or in preparation, present currents are such that seasonal dullness is conspicuous by its absence. Business failures for the week ending Dec. 9 were 373, which compares with 333 last week, 427 in the like week of 1914, 371 in 1913, 281 in 1912 and 309 in 1911.

American Wool and Cotton Reporter—The wool market has remained quiet because mills have been taking account of stock, and getting ready for the new season. A fair amount of business has been transacted both in foreign and domestic wools. Values are tending upward in sympathy with the foreign market. Mills are running largely on domestic business, which are in greater volume than war orders.

Marshall Field & Co.—Current wholesale distribution of dry goods for the week was in greater volume than in previous years. Many lines have been advanced, and the market continues firm. Collections are better than last year at this time.

Southern Lumberman—Stability of the yellow pine market, at the price advances which have been noted during the past two months and with present increases in value, now seems assured. This condition is due to the continued and extensive building activity which the unusually fine weather of the fall and early winter has permitted, and to the fact that the railroads are again in the market, on an extensive scale. Despite the near approach of the time for taking inventories and the general slackening up in buying which customarily precedes that business function, in order to put purchases of raw material on the expense sheets of the coming year, the hardwood market is also coming down the home stretch of 1915 with increasing momentum. Consuming factories apparently realize the strength of the market, and exhibit a disposition to buy somewhat in advance of their requirements.

ATLANTIC SEABOARD

BOSTON

Pocahontas and New River temporarily cut off from Eastern spot market. High prices rule at distribution points. Georges Creek out of the market. Pennsylvania grades very active at new high figures. Water freights soaring. Anthracite deliveries slow; active demand.

Bituminous—With Pocahontas and New River at Hampton Roads there is no material change. Accumulations are still heavy and aside from steamers, arrivals are very slow. There is much anxiety in this territory over the light shipments the last month or more and a good many consumers with coal due them are trying to buy all-rail to give them the reserve stocks they require. The situation gets worse from day to day and unless the weather clears for longer periods allowing tows to move, or unless more steamers are available, New England will be getting seriously short of steam coal. It is only a question of time when prices f.o.b. Hampton Roads will stiffen with those at Philadelphia and New York, but as it is the famine in boats is so great that there is small opportunity for merchants to speculate by getting cargoes forward. What boats are chartered at current rates are chiefly to replace others that are behind schedule or lost, and practically all of the coal is for application to season contracts.

As high as $6.25 has been paid for spot Pocahontas and New River on cars, Boston, for delivery up the line, but these grades are available only in small quantities.

The Georges Creek shippers have practically withdrawn their coal from the market and are confining themselves to contract business. Orders are being filled with reasonable promptness but interruptions are feared for the near future. All-rail deliveries do not improve.

The market for the Pennsylvania grades, practically the only coals available for this market for anything like prompt shipment, is very active with prices advancing from day to day. While it is understood that numbers of shippers sent cars forward to the transfer points in anticipation of such a market, yet prices are firm up to $2.75 at the mine and buyers are thick in the regions. Only a fair grade of Somerset County coal sold at more than $5 a week ago, and $4 f.o.b. Philadelphia is not far from the market price there.

Boston dealers advanced contract prices on bituminous from $4.40 to $4.65 per ton of 2,000 lb., delivered by team, beginning Dec. 31.

Water Freights reach a new notch every few days. Bottoms are so scarce that there is no knowing how high rates will go; $3 has been paid to Boston from Hampton Roads, and $2.75 to Providence. One charter is reported of a barge of any size and at any time between now and Mar. 1 at $2.50 to Boston. It is hard to see how freights can recede for a long while to come, unless a lot of tonnage now offshore is attracted to the coastwise trade by rates now prevailing.

Anthracite—Orders continue to pile up and there is a good deal of uneasiness on the part of Tidewater dealers over slow shipments. Some retailers are entirely out of certain sizes, and meanwhile the weather continues cold and unfavorable to movement along the coast.

Bituminous quotations, f.o.b loading ports at points designated, are about as follows:

	Philadelphia	New York	Baltimore	F.o.b. Mine
Clearfields	$3.60@4.00	$3.85@4.25	....	$2.40@2.75
Cambrias and Somersets	3.75@4.10	4.00@4.35	....	2.50@3.00
Georges Creek	....	....	....	(Nominal)

Pocahontas and New River prices, on cars Boston, are $6@6.25; Providence, $5.75@6; and f.o.b. loading ports at Hampton Roads, $2.85.

NEW YORK

Anthracite market stimulated by cold and storms. Domestic coals easy but in good demand. Steam grades strong. Bituminous active with Pittsburgh grades being offered here. Many export inquiries.

Anthracite—Colder weather and storms early in the week stimulated the hard coal situation and the market has tightened up. Deliveries were for a time somewhat delayed. Wholesale dealers received many inquiries as to the outlook but were able to reassure their customers. Efforts to increase the movement from the mines met with no more success than last week.

The companies are easy on all domestic coals. Stove is moving slowly, dealers being asked to take mixed cargoes where this size is wanted. There is plenty of egg to meet all demands and chestnut is easy. No pressure is being brought to bear on individual coals which are apparently well sold up. The steam grades are strong. Pea is easy and commanding full circular. All small grades are commanding full prices, the low ash coals being practically sold out. Very little No. 2 buckwheat is to be had at the upper ports.

Reports from along the line are encouraging. Most dealers are fairly well supplied but there is complaint of poor deliveries by the railroads. Demand from New England continues heavy. There is much anxiety over the high water rates and it is predicted that buyers will soon order shipments direct from the mines. This will help to relieve the situation at Tidewater.

Quotations, f.o.b., gross tons, at Tidewater, follow:

	Lower Ports		Upper Ports	
	Circular	Individual	Circular	Individual
Broken	$5.05		$5.10	
Egg	5.30	$5.30@5.30	5.35	$5.35@5.35
Stove	5.30	5.30@5.30	5.35	5.35@5.35
Chestnut	5.55	5.55@5.55	5.60	5.55@5.60
Pea	3.50	3.45@3.50	3.55	3.50@3.55
Buckwheat	2.75	2.45@2.75	2.80	2.45@2.80
Rice	2.25	1.95@2.25	2.30	2.00@2.30
Barley	1.75	1.50@1.75	1.80	1.75@1.80

Bituminous—The soft-coal market is active and prices have advanced from 35c. to 50c. over last week, due to the slow delivery. Offers to ship Pittsburgh high volatile coal at $1.25 f.o.b. mines have been received by many local dealers but no orders have been reported as yet.

There has been no improvement in the congestion and many shippers have boats tied up at the docks waiting for deliveries. This has caused an increased shortage of bottoms and also an advance in the harbor freight rates, quotations going as high as 35c.

There is not much quibbling over prices or quality in negotiations on free coals. Contract holders continue to take their full allowance and more when they can. There is sufficient coal at the docks to meet urgent demands but it is nearly all contracted for, very little free coal being offered. Slack is quoted at $1.50 to $1.60.

Current quotations on the various grades, f.o.b. gross tons, at Tidewater follow:

	South Amboy	Port Reading	St. George	Mine Price
Georges Creek Big Vein	$4.30@4.55	$4.30@4.55	$4.30@4.55	$2.75@3.00

PHILADELPHIA

Anthracite brisk with particularly strong demand for buckwheat and rice and heavy orders for pea. Chestnut also beginning to move and broken shows a substantial increase. Bituminous prices touch the $2 mark with the demand still on the increase.

Anthracite—The cold weather and storms have opened up the anthracite trade in full blast and the situation shows indications of continued activity for some time to come. If railroad facilities permit, December tonnage records will no doubt be broken as the trade will gather still greater momentum as the season advances. The dealer trade and manufacturers are now taking energetic measures to cover their requirements and this condition will shortly spread to domestic consumers. But in spite of the strong technical position of the market, there is still a pernicious price-cutting being carried on in certain quarters.

Pea coal continues the leader, individuals now obtaining $2.50 and the tax on this grade, as compared with $1.75 last summer. The $2 and tax price, at which the big companies have protected customers, is probably one of the biggest bargains the trade has known for a number of years.

Broken coal continues brisk at $3.25 on contracts and $3.50 in the spot market, both including the tax. The companies have notified their customers that this grade will be advanced 10c. on Jan. 1, when the current contract expires, so that buyers are urging as rapid deliveries as possible. Egg coal is the only weak size, individuals having been compelled to make concessions of 15 to 25c. off the $3.75 circular price on cars standing at the mines without orders. Stove continues strong at the full circular of $4.90 and the tax, and there is apparently little surplus of this grade available.

The outstanding development of the week has undoubtedly been the impressive advance of the steam coals which are now commanding the full circular, even on the storage grades. The steam sizes have apparently been carried up with the rapid advance in bituminous coal, with which they are in competition, and with hundreds of thousands of tons in storage, the increased demand is more than welcome. The call for buckwheat has been so heavy that many orders are still unfilled, and rice coal, which has been dragging behind for so long, is now moving with no trouble.

The announcement of an increase in prices on the new contracts, effective Jan. 1, was another important development of the week, and has caused a marked hesitancy on the part of buyers, so that negotiations on this business are behind a normal season.

The circular prices per gross ton at the mines for line shipment and f.o.b. Port Richmond are as follows:

	Line	Tide		Line	Tide
Broken	$3.50	$4.75	Pea	$2.50	$3.25
Egg	3.75	5.00	Buckwheat	1.50	2.25
Stove	4.00	5.00	Rice	.85	1.75
Chestnut	4.15	5.25	Barley	.50	1.50

Bituminous—The demand for coal is increasing at such a rate that some big consumers are sending their purchasing representatives to the mining regions. Brokers and speculative interests are active and it is nothing for a car of coal, after reaching destination, to pass through three or four hands before it reaches the ultimate consumer. In addition to the rapidly increasing local demand there is a growing demand for coal from the New England territory via rail because water freights have advanced to such a point that it is more advantageous to get shipments by rail. Prices have gone steadily upward and the $2 price has been recorded for four or five of the different grades. There is hardly any foreign trade outside of that contracted for some time ago. While prices for the local trade are only quoted for prompt acceptance, often changing over night, the following table will give an idea of the average, prevailing up to date, per gross ton at mines:

Georges Creek Big Vein	$2.20@2.30	Fairmont gas, ¾	$1.60@1.70
South Fork Miller Vein	2.25@2.30	Fairmont gas, mine-run	1.40@1.50
Clearfield (ordinary)	2.00@2.15	Fairmont gas, slack	1.20@1.30
Somerset (ordinary)	2.00@2.10	Fairmont lump, ordinary	1.45@1.55
West Va. Freeport	1.90@2.00	Fairmont mine-run	1.35@1.45
		Fairmont slack	1.20@1.30

BALTIMORE

Car supply occasionally down to 25% requirements. Vessel freight rates at prohibitive levels. Practically no coal at Tide. Heavy snow complicates retail situation.

With the Baltimore & Ohio, Western Maryland and Pennsylvania supplying at times, less than 25% car requirements at the mines, coal has been growing steadily scarcer at the terminals. The supply at Tide here occasionally falls off to practically nothing. Many coals are selling at big advances over what they would bring at the mines if cars could be supplied. Some of the railroads such as the Erie and Lehigh Valley have sent their own equipment to mines on the Baltimore & Ohio to obtain coal for their own use. Where coal is bought on a basis insuring early delivery prices are substantially higher.

Quotations, while changing from day to day, are about as follows:

	Mines	Balt.*	Fairmont	Mines	Balt.*
Geo. Crk. Big Vein	$2.50	$3.68	Ordinary mine run	$1.65	$3.13
Geo. Crk. Tyson	2.10	3.28	Ordinary ¾	1.80	3.28
Clearfield	1.90	3.08	Ordinary slack	1.25	2.68
South Fork	1.95	3.13	Low sulphur mine-run	1.90	3.38
Latrobe	1.85	3.03	Low sulphur ¾	2.00	3.48
Somerset (best)	1.90	3.08	Low sulphur slack	1.30	2.73
Somerset (good)	1.80	2.98			
Quemahoning	2.00	3.18			
Freeport	1.80	2.98			
Miller Vein	1.90	3.08			

* F. o. b., outside Capes.

The retail situation has been complicated by the heavy fall of snow on Monday and Tuesday. This caused an increased pressure for deliveries of anthracite and dealers were forced to draw more heavily on reserve stocks than they desired.

HAMPTON ROADS

Dumpings for week fair. Vessel tonnage scarce and rates high. Concessions on prompt tonnages.

Dumpings over Hampton Roads piers for the week have been fair. Bunkering has been rather light. The accumulation at Tidewater is above normal and demand light, especially on the New River and Pocahontas coals. On high volatiles there seems to be some improvement and some small quantities of gas coal have moved foreign during the week. There is some scarcity of high volatile grades at Tidewater due to the usual demand at about this time in the West. While the regular circular is being quoted it is believed that prompt coal can be bought at 10 to 15c. off. Prices on high volatile range from $2.55 to $2.65.

During the last few weeks householders here have been offered a new fuel in the form of briquettes for domestic use. The promoters claim that they are smokeless and odorless, give 50% more heat and are much cheaper than coal. It is understood that they will sell at about $6 per ton against $7.50 for Pennsylvania anthracite.

Railroad Tonnages—Dumpings over the local piers for the past five weeks compare as follows:

	Week Ending				
Railroad	Nov. 13	Nov. 20	Nov. 27	Dec. 4	Dec. 11
Norfolk & Western	133,329	100,598	118,065	116,450	87,726
Chesapeake & Ohio	70,282	67,209	93,924	81,875	70,535
Virginian	72,888	39,485	54,591	41,386	52,247
Totals	276,499	207,292	266,580	239,711	210,508

OCEAN FREIGHTS

Since last report the Greek Steamer "Platea," about 5,000 tons coal capacity, December loading, was chartered from Virginia to a Lower Plate port at $12.60, with 500 tons per day discharge at 30c., and we have another boat offered on these terms. There is an active demand for steamers for Cuban and West Indian ports and we have recently closed a number of boats on terms quoted below. The only coal that we are moving for Mediterranean ports is on steamers that we are chartering on time charter. About $22.80 is now offered on grain to the west coast of Italy, and vessel owners seem to prefer grain to coal on the same basis of freight.

We would quote freight rates on coal by steamer as follows:

To	Rate	To	Rate
Havana	$3.00@3.25	Bermuda	$4.00@ 4.25
Cardenas or Sagua	3.50@4.00	Vera Cruz	5.50@ 6 00
Cienfuegos	3.75@4.00	Tampico	5.50@ 6 00
Port au Spain, Trinidad	4.75@5.00	Rio	12.00@12 60
St. Lucia	4.75@5.00	Santos*	12 00@13.20
St. Thomas	4.25@4.50	Montevideo	12.60@10.80
Barbados	4.75@5.00	Buenos Aires or La Plata†	12.60@13.20
Kingston	4.25	Rosario	13.20@14.40
Curacao	4.50	West Coast of Italy	22.60@24.00
Santiago	4.00@4.25	Barcelona**	20.40@21.60
Guantanamo	4.00@4.25	Valparaiso or Callao	12.00@13.00
Demerara	6.50@7.00	Marseilles	20.40@21.60

* Consignees paying dockage dues. ** Spanish dues for account. † Quotations on Plate coal by British steamers; neutral steamers are more difficult to obtain and the rates are always higher.

W. W. Battie & Co.'s Coal Trade Freight Report.

Note—Charters for Italy, France and Spain read: "Lay days to commence on steamer's arrival at or off port of discharge. 24c. per net register ton per day demurrage."

OHIO VALLEY

PITTSBURGH

Inquiry for Pittsburgh coal at Seaboard. Car scarcity continues. Line demand good. Slack higher.

As a result of the heavy demand for coal in the East, it was positively asserted on excellent authority that $1.75 had been bid for Pittsburgh coal where the seller could assure immediate shipment by furnishing car number at the time the business was negotiated. With the car supply continuing very short it has not been possible to accept much of this business, but it is understood that some shippers have been able to take up some of these offers in the case of a few cars. The full quota of empty cars has not returned to the coal mines upon the closing of Lake navigation, just as was expected in some quarters.

Domestic trade has improved considerably and there is a moderately good movement to retail dealers. There continues to be an excellent demand from manufacturing establishments, and perhaps a slight increase. The market is not suffering particularly from the cessation of Lake shipments, as to mine-run and screened coal, while as to slack there is naturally a further stiffening. Prompt slack is now bringing very close to the mine-run basis and in some quarters predictions are made that eventually the two descriptions will sell at practically the same level.

We quote free coal as follows: Slack, $1@1.05; nut, $1.15; mine-run, $1.15@1.20; ¾-in., $1.25@1.35; 1¼-in., $1.35@1.45; on contract to Apr. 1. Slack, $1@1.10; nut, $1.25; mine-run, $1.25@1.35; ¾-in., $1.35@1.40; 1¼-in., $1.45@1.55, per net ton at mine. Pittsburgh district.

BUFFALO

Marked activity in bituminous and the supply is short. Scarcity of men and cars. Fictitious prices being quoted.

Bituminous—The demand exceeds the supply everywhere and there is no surplus coal. Allegheny Valley grades are difficult to get and prices are past any sort of intelligent quoting. Shippers generally advise making a nominal quotation only, as it is often purely a matter of getting the coal. Slack is sometimes bringing prices that would have seemed extravagant a month ago. One shipper estimates that the Buffalo market proper has advanced 25c. An out-of-town jobber is reported to have bought a block of coal here that he sold in New England at 35c. advance. As a rule the Allegheny Valley mines are out of slack and will not quote on it. Pittsburgh slack is not so scarce and it may not give out.

Quotations are made with a certain reservation, especially as regards Allegheny Valley coal, as follows:

	Pittsburgh	Allegheny Valley	Penn Smokeless
Lump	$2.80	$2.60	$2.55
Three-quarter	2.65	2.40	.....
Mine run	2.55	2.30	2.30
Slack	2.15	2.15	2.30

Quotations are f.o.b. cars at Buffalo or the Niagara bridges and per short ton except east of Rochester or Kingston, Ont.

Consumers of bituminous are now sending in nervous telegrams, urging dispatch on the part of shippers, much as anthracite buyers commonly do in December.

Anthracite—There is some improvement in the demand, and with the coming of snow the trade ought to show more life. Should Canadian activity increase the shippers would be satisfied, though there is not much prospect of regaining the lost tonnage. As the season progresses the prospect of making up the loss becomes more remote though sales are fairly good. Chestnut is very scarce, but egg is abundant. The independent shippers are getting full circular prices and are predicting a premium in certain sections soon. Locally, the trade is only fair, though domestic consumers have not stocked up much yet.

The Lake season is practically closed The December shipments are about as heavy as in any previous season, being 104,126 net tons. That the entire amount has been less than for the season of 1914 is only because unloading space has not been available, owing to the large amount left over last spring.

COLUMBUS

Steam business continues to improve. Domestic trade a trifle slow. Prices are generally well maintained.

The best feature of the trade is the increased demand for steam sizes in sympathy with the general expansion in manufacturing. Steel plants are buying well and railroads are taking a larger tonnage both for immediate use and for storage purposes. Shortage of cars is having its effect on the trade and many factories which formerly depended on West Virginia mines are looking to Ohio for steam grades. The car shortage is the most pronounced on West Virginia roads.

Domestic business is a trifle slow following a rush of orders due to the lower temperatures. Dealers have placed orders for immediate shipment and are going slow in taking on extra business. Retail prices have advanced; Pocahontas lump is now selling at $4.75 and Hocking lump at $3.50. Anthracite business is slowly increasing in central Ohio territory.

The Lake trade is now over and arrangements are being made for the coming year. Operators generally predict a better Lake trade in 1916 than in 1915. It is believed that the tonnage on the docks of the upper Lake ports will be used up completely during the winter leaving a deficiency, compared with the spring of 1915.

Prices in Ohio fields f.o.b. mines, per short tons are as follows:

	Hocking	Pomeroy	Eastern Ohio	Kanawha
Re-screened lump	$1.60	$1.65	.....	.....
Inch and a quarter	1.50	1.50	$1.35	$1.50
Three-quarter-inch	1.35	1.40	.....	1.35
Nut	1.25	1.30	.....	1.25
Mine-run	1.15	1.20	1.05	1.10
Nut, pea and slack	.90	.95	.80	.80
Coarse slack	.80	.85	.70	.70

CLEVELAND

Eastern demand seems to be affecting this region. Prices are unaccountably higher. The retail trade slowing up.

The trade here is having no difficulty getting all it needs, but fine coal prices are higher, due to the larger demand from the East and from the steel industry. The shutting off of Lake shipping has also curtailed the production of fine coal and this is felt distinctly. Operators have refused orders for coal for this district because of the higher market in other directions.

The retail trade is over the first rush, having taken in the initial fall orders, and is now waiting for the steady business that marks the winter, with now and then a spurt, due to cold weather. Ohio fine coals are coming into this market now; coarse grades are confined to Ohio coals and domestic sizes of smokeless. Youghiogheny does not come into this market very much, but jobbers are buying for out-of-town trade at quotations. The Pocahontas coarse coal market is weak, due to the fact that New England shipments are curtailed by a shortage of coastwise tonnage and operators are forced to sell where they can.

Jobbers are paying the following prices f.o.b. Cleveland per short ton:

	Pocahontas	Youghiogheny	Bergholz	Wainwright	No. 8
Freight	$1.45	$1.00	$0.70	$0.70	$0.90
Lump	3.25	.....	.....	....	....
Lump, 6 in.	....	.....	2.30	....	.....
Lump, 1¼ in.	....	2.30	2.10	2.30	2.05
Lump, ¾ in.	....	2.20	2.00	2.10	1.95
Lump, 3 in.	....	.....	.....	2.40	....
Egg	3.25	.....	.....	....	....
Mine run	2.70	2.15	1.90	1.95	1.90
Slack	....	2.00	1.90	1.90	1.90

TOLEDO

Domestic grades quiet but steam business active. Navigation closed.

The domestic market has been a little off owing largely to unfavorable weather conditions. There seems to be something of a surplus of this grade. Steam coal is generally strong so far as egg and slack is concerned. Lump is more of a drug on the market and Pocahontas lump is down to $2. Some of the dealers claim to be getting this price but there are some offerings as low as $1.80. Large steam consumers do not seem to be over supplied although all are carrying average stocks. The navigation season has officially closed but there are still a few boats moving, cleaning up the stocks on the local docks.

The Hocking Valley Railroad Co., it is announced is planning to spend $250,000 in extensions of its Toledo dock yard on the East Side. Millions are to be spent in double tracking this road between Toledo and Columbus. With the completion of a connecting link between the C. & O., and the Hocking in 1916, it is estimated that additional room will be needed as will also additional yard facilities at Walbridge.

DETROIT

Steam coal buying continues steady. Demand for domestic coal shows slight improvement. Anthracite quiet. Shippers pay higher rate for boats.

Bituminous—Regularity of orders, even though sales are not particularly large, is a steadying influence in the market. Small sizes are the most active and shortest in supply. Egg coal is the slowest size though there has been no reduction in price or large accumulation of stocks. The domestic market has improved due to the continued low temperatures. Car shortage appears more acute on certain Pennsylvania lines in Pennsylvania, than on any of the Ohio roads. Sales of consignment coal are now being made on practically the same basis as mines prices.

Anthracite—The trade is fairly active on chestnut. Some shippers have difficulty disposing of the larger sizes they are obliged to take in order to obtain enough chestnut for their needs.

Lake Trade—With only a few days of the navigation season remaining shippers are showing considerable anxiety to get boats. Rates of 75c. a ton are being paid on small cargoes. Some vessel owners are offering boats at a $1 rate but contracts have not been made and the expiration of the insurance limit at midnight, Dec. 12 leaves very few freighters available.

CINCINNATI

Improved sentiment, with better demand and firm prices. More cars and colder weather.

There is a more optimistic feeling in the trade though without any tangible improvement. More wintry weather has appeared resulting in greater strength on the domestic grades while the steam market has also been strong. Both nut and slack and mine-run have participated in the improvement. Slightly better car supply at the mines is also reported, the average supply now being about four days, as compared with three days and less a short time ago. The market will be stronger as the winter advances.

LOUISVILLE

Winter demand has greatly stimulated the domestic market. Operations at the mines are generally on a larger scale and the supply of labor will apparently prove equal to requirements. Steam coals are in continued good demand and reflect the improved industrial conditions. Prices show little if any change.

COKE

CONNELLSVILLE

Anxiety concerning supplies over the holidays causes a heavy buying movement and sharp advance in the prompt market. Production and shipments slightly increased.

Conditions in the pig-iron market make it certain that all furnaces capable of operating will be blown in, as pig iron prices have been advancing sharply, but the advances may be due chiefly to there being no means of increasing output, and hence there can be no material increase in coke consumption. With so many byproduct plants to be completed in the next six months the coke outlook is particularly blue since beehive coke will be correspondingly released.

Anxiety over the increasing car shortage and the possibility of interruptions over the holiday period created a spectacular advance in the coke market the early part of the week. Sales of prompt furnace coke have been made at $2.50, while rumors of a $3 figure were heard and prompt foundry coke sold as high as $3.75. We quote prompt furnace $2.50@3 and prompt foundry at $3.25@3.75; contract furnace, six months, $2.35@2.50; year, $2.25@2.35; contract foundry, $3@3.25, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Dec. 4 at 437,251 tons, an increase of 4,910 tons, and shipments at 439,165 tons, an increase of 4,081 tons.

Buffalo—The market is a trifle dull. There was a slight falling off in the price last week, caused by reaction from over-booming the trade. The market has recovered, probably on account of car shortage. The consumption appears to increase. Prices for this market, f.o.b., range from $5 to $5.20 for best 72-hr. Connellsville foundry and $4.30 for stock coke.

Chicago—The coke market is brisk with the demand for furnace and foundry sizes unabated. Byproduct domestic sizes are also in better demand. Prices per net ton, f.o.b. cars Chicago, are as follows: Byproduct, foundry, $5.25@5.75; byproduct, domestic, $4.75@4.95; Connellsville, $5.25@5.75; Wise County, $5.25@5.50; gas coke, $4@4.25.

St. Louis—Between domestic and industrial consumption, byproduct coke is enabled to maintain a fairly steady movement. Mild weather has checked sales for gas house. Very little demand for petroleum coke. The following prices prevail f.o.b. cars St. Louis: By-product (all sizes), $5; gas house (lump or egg), $4.25; petroleum, $6.25.

MIDDLE WESTERN

GENERAL REVIEW

Weather more seasonable. Steam coal buying continues in steady volume. Domestic demand below expectations. Screenings strong.

Developments of the past week have shown pronounced evidence of strength in steam coals and screenings, while domestic buying has slacked off owing to lack of snappy cold weather. Retailers complain that buying by the public is still in small lots, with little disposition to put in reserve stocks. Some concessions in spots have been made on coarse domestic sizes, but on the whole list prices are well supported. The domestic trade is fair but not up to expectations, though the steam sizes are bullish at higher prices.

Fine coal is likely to continue at maximum prices unless severe wintry weather prevails for an appreciable period. Many operators and wholesalers refuse to quote on fine coal, and open shipments are sold quickly at high prices; it is felt that many industrial plants will have to pay higher prices than for a number of years. Operators are holding coarse coals at the mines rather than rush shipments into the markets to be sacrificed at low prices. The smokeless market is still feeling the effects of the recent sacrifice of several hundred cars of smokeless lump and egg at mine-run prices; this is about the only real weak feature of the situation. The expected improvement in the car supply due to the release of the equipment used for lake cargoes, has hardly had enough time to materialize, though it is noticeable that supply is easier.

INDIANAPOLIS

Indiana mines on full schedule, due to demand from railroads and industrial plants. Screenings prices higher. Weather still unfavorable to domestic trade. Car situation satisfactory.

Indiana has had no real winter weather as yet but most of the mines are making full time, due chiefly to the buying of railroads and industrial plants, many of which are stocking earlier than usual in preparation for the biennial wage conference. Screenings have strengthened and are commanding 85c. in the open market for Nos. 5 and 6. The larger companies say they have very little to offer in their home territory. No. 4 1¼-in. steam coal sells at $1.40 f.o.b. mine and domestic lump at $1.50 for Nos. 5 and 6 and $1.65 for No. 4. Many of the industrial plants, particularly steel concerns have sold far ahead and are taking no chances on their coal supply, which accounts for the large orders. The weather is against an active retail trade, but dealers are not complaining.

CHICAGO

Smokeless coals still demoralized. Screenings advancing. Coarse steam shipments heavy. Anthracite quiet.

Orders for Franklin County domestic sizes have been arriving in better volume lately. Williamson County coal is moving slowly, but at good prices, mostly to Northern points, shipments to the South having fallen off slightly. Screenings are in stronger demand, and No. 2 nut is taken freely. Fine coal is strong at about 80c. with future shipments quoted at 85c. Saline domestic lump, egg and No. 1 nut are easy.

Springfield domestic lump has been easy, but no sales are reported at less than $1.65. The demand for Springfield screenings from the Chicago district has been unusually heavy the past week. Egg coal seems to be in better demand than lump.

Railroads are stocking increased quantities of Indiana 1¼-in. steam lump. Less than the usual volume of Indiana coal is moving to Chicago. The demand for steam coals seems to come chiefly from Indiana factory towns. Mines are operating every day, screenings are scarce and domestic-lump business is good.

Smokeless is still in a poor position because of the recent dumping of a heavy tonnage of consignment coal in the Chicago market. Prepared sizes have sold as low as $1.65, and some mine-run has been sacrificed below $1.25; $2 on lump and egg, and $1.75 on nut in flat bottoms, with prices 15c. lower on hopper shipments are claimed to be the established prices at this time. Stocks of West Virginia smokeless coal are at the maximum, and the outlook is not promising. The situation is due to the closing of navigation, which caused an abnormal amount of Lake smokeless to be thrown into the Chicago market by rail at an unpropitious time, though it is thought that all this surplus coal has now been absorbed. Pennsylvania smokeless was but little affected by this state of affairs. Splint shows no life because prices continue too high to make shipments into this territory attractive.

A slight improvement is shown in the demand for anthracite, and orders for chestnut the last few days have reached Chicago in increasing volume. In many Illinois cities coke is now becoming the formidable competitor of anthracite. The increasing use of coke is causing many retail dealers to question the continued use of heavy coal-lifting machinery because of the light weight of coke as compared with anthracite.

Quotations in the Chicago market are as follows, per net ton f.o.b. mines:

	Williamson and Franklin Co.	Springfield	Sullivan	Clinton	Knox and Greene Cos.
Lump	$1.60@1.75	$1.60@1.75	$1.50@1.65	$1.40@1.60	$1.40@1.60

Screenings	70@ .80	.70@ .80	....	....	.75@ .90

ST. LOUIS

Screenings advance still further. Standard grades slightly stronger.

Screenings advanced another notch during the past week. Franklin and Williamson County screenings which were around 65 to 70c. are now strong at 75c. Standard and Staunton, which ranged last week from 55 to 60c. are now from 60 to 65c. The Standard list is a trifle stronger in almost all grades, but there is little movement of lump. The industrial situation is about the same.

Quotations f.o.b. mines are on the following basis per short ton:

	Frnk. Co.	Wlmson. Co.	Staunton	Standard
6-in. lump	$1.50@1.65	$1.50@1.65	$1.25	$1.15@1.25
8-in. lump	....	....	....	1.15@1.25
2-in. lump	....	....	1.15	1.00
3x6 egg	1.40@1.65	1.40@1.65	....	.95
2x6 egg	....	....	....	.85

Screenings	.75	.75	.60@.65	.60@.65

Freight Rates—Inner group, St. Louis, 57½c., East St. Louis, 37½c. Outer group, St. Louis, 72½c.; East St. Louis, 57½c.

DULUTH

Mild weather affects the trade. Only a fair amount of coal moving. Prices firm. Lake shipping practically over.

The absence of any really cold weather caused a rather sluggish movement on all the prepared sizes of bituminous coal. Hand-to-mouth buying prevails to a large extent. Very little coal was received during the week, many of the boats having been laid up for the winter and navigation is now practically over. Prices remain very firm, no deviation from circular being reported. Quotations per short ton, f.o.b. cars at Duluth docks are as follows:

	Yough	Splint	Hock	Smokeless	Elkhorn
Lump	$3.40	$3.40	$3.40	$4.75	$3.75
Dock run	3.10	3.10	3.10	3.25	3.25
Egg, stove and nut	3.40	3.40	3.40	4.75	3.65
Screenings	2.40	2.40	2.25	2.[illegible]	2.55

There has been very little life to the anthracite trade due to the extremely mild weather, and the trade is anxiously awaiting a drop in the temperature that will undoubtedly create an influx of orders. Prices are as follows per short ton f.o.b. docks: Nut, $7.10, stove and egg, $6.85, pea $5.55 and buckwheat, $4.

KANSAS CITY

Steam demand is somewhat heavier and colder weather has quickened the domestic trade. Selling has been heavier than for some time past and mines in the Missouri, Kansas, Oklahoma, and Arkansas fields are working steadily. No increases have been asked, although some mine owners have been forced to go into the open market to obtain supplies. A tendency is noted among concerns using fuel oil to change back to coal as a result of the present high prices that have greatly forced up fuel oil.

PRODUCTION AND TRANSPORTATION STATISTICS

ANTHRACITE SHIPMENTS

The shipments of anthracite for November 1915 as reported amounted to 6,297,215 long tons, which establishes a new record for November shipments for the region. The largest previous November shipments were in 1911, when 6,193,314 tons were sent to market. The largest shipments in any one month were in October 1912, when they totaled 6,665,321 tons. These figures were closely approached by the shipments of October 1914, which amounted to 6,664,476 tons. Compared with November 1914 the shipments last month showed an increase of 368,929 tons, and compared with October of this year they exhibit a decrease of 208,677 tons.

TIDEWATER STOCKS

	Tons		Tons
Port Reading	44,040	Port Johnson	21,954
Port Richmond	153,970	South Amboy	306,058
Greenwich	8,006	Perth Amboy	53,868

LAKE SHIPMENTS

Anthracite shipments through the Sault Ste. Marie Canal for November amounted to 233,708 tons, and bituminous was 1,343,248.

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

✚Indicates contracts regarding which official information has been received.

Supplemental Notes

Under this heading additional or supplemental information regarding old contracts appears, together with the page number of the original notice.

1598—New Orleans, La.—Bids have been received on this contract (pp. 736, 957), which provides for furnishing the Public Belt Railroad Commission with approximately 8,000 tons of coal, as follows:

Company	Coal	Price per Ton
W. G. Coyle & Co.	Sipsey egg	$3.15

[1] Jagger Creek. [2] From Dixiana, Ala. [3] Black Creek washed. [4] Mine-run.

Address Secy. F. H. Joubert, Public Belt Railroad Com., Municipal Bldg., New Orleans, La.

1603—Krumroy Station, Ohio—Awards on this contract (p. 737), which provides for furnishing the Springfield Lake Sanitorium with approximately 15,000 tons of coal, will not be made until Jan. 1. Address Secy. F. L. Allen, Bd. of Trustees, Springfield Lake Sanitorium, Canton, Ohio.

1622—Spokane, Wash.—There were only two bids submitted on this contract (p. 787), which provides for furnishing the City Government with coal. The Diamond Ice and Fuel Co. bid $4.75 per ton for Carbondale slack and $5.45 per ton for mine-run, while the Crows Nest Pass Co. bid $4.80 on slack and $5.35 for mine-run. The contract involves approximately 600 tons for use at the various city institutions. It is understood that there is considerable controversy over the contract, and no award has as yet been made. Address Purchasing Agent, City of Spokane, Spokane, Wash.

1677—Chicago, Ill.—No awards have as yet been made on this contract (p. 912), which provides for furnishing the City Pumping Station with coal during the ensuing year, and it is now understood that the city will continue taking coal on the old contract for the next three months, provision for such an extension being embodied in that agreement. Address Comr. of Pub. Works L. E. McGann, Room 406, City Hall, Chicago, Ill.

1718—Robesonia, Penn.—The distribution of requirements on this contract (p. 998), which covers the purchases of the Robesonia Iron Co., are as follows, per annum: At the Robesonia, 2,400 tons of bituminous, 1,500 tons of anthracite and 60,000 tons of furnace coke; at Miners Village, 2,400 tons of bituminous. Address Supt. S. B. Patterson, Robesonia, Penn.

New Business

Volume and page number in parentnesis at the end of an item indicate where the previous announcement, bids and awards on that contract may be found.

1747—New York, N. Y.—Bids will be received until 2 p.m. Dec. 20, for furnishing and delivering approximately 3,000,000 lb. of buckwheat No. 2, and 500,000 lb. of egg coal alongside of dock at the Asphalt Plant between 90th and 91st St. and East River. The contract is to expire on Apr. 1. Address Commissioner of Public Works, Room 2032, Municipal Bldg., New York, N. Y. (No. 605, Vol. 7, pp. 795, 918.)

1748—Mansfield, Ohio—The Mansfield Sheet and Tin Plate Co. is in the market for its annual fuel requirements, involving approximately 30,000 tons of Ohio ¾-in. steam coal. Deliveries are made by B. & O. R.R. Address Pres. W. H. Davey, the Mansfield Sheet and Tin Plate Co., Mansfield, Ohio.

1749—Mt. Vernon, Ill.—The Citizens Gas, Electric and Heating Co. is receiving bids for furnishing its fuel requirements, involving from 400 to 500 tons of 3-in. screening per month. Address Pur. Agt., H. A. Lomire, The Citizens Gas, Electric and Heating Co., Mt. Vernon, Ill.

1750—Urbana, Ohio—The United Paper Board Co. is receiving bids for a prompt shipment of 15 cars of nut and slack coal. Address Cashier R. R. Owen, United Paper Board Co., Urbana, Ohio.

1751—Chelsea, Mass.—The Revere Rubber Co. at this place usually contracts for its annual fuel requirements involving approximately 15,000 tons of New River mine-run coal in February. Deliveries are made by wagon at the rate of approximately 50 tons per day and the coal is bought under a guarantee of 14,500 b.t.u. The company has a storage capacity for 2,200 tons. Address Mgr. E. H. Scribner, Revere Rubber Co., Eastern Ave., Chelsea, Mass.

1752—Kalamazoo, Mich.—Chase & Woodruff are in the market for between 1,200 and 1,500 tons of West Virginia splint, nut and slack coal for prompt delivery. Address Pur. Agt. E. W. Chase, Chase & Woodruff, Kalamazoo, Mich.

1753—Lisbon, Ohio—The Board of Public Affairs will receive bids until 7 p.m. Dec. 15, for furnishing coal as may be required for the local Water-Works during the ensuing year. Bids were requested on mine-run, slack, and nut from Nos. 3 and 6 and from Pittsburgh vein coal. Quotations should be made f.o.b. switch at the Water-Works plant and a certified check for $50 must accompany each bid. Address Clk. W. E. Ferrall, Bd. of Pub. Affairs, Lisbon, Ohio.

1754—Philadelphia, Penn.—The Vulcanite Portland Cement Co. usually contracts for its annual fuel requirements involving between 25,000 and 50,000 tons of mine-run steam coal, and 50,000 to 75,000 tons of gas slack some time in January. The company has a storage capacity for 10,000 tons and deliveries are made by railroad. Address Purchasing Agent, Vulcanite Portland Cement Co., Land Title Bldg., Philadelphia, Penn.

1755—St. Louis, Mo.—The United States Engineering Department will receive bids until 11 a.m. Dec. 29, for furnishing the department with approximately 30,000 tons of coal during the ensuing year. Complete information may be had on application. Address United States Engineer Office, Custom House, St. Louis, Mo. (No. 26, Vol. 6, p. 972.)

1756—Delphos, Ohio—The Delphos Gas Co. is receiving bids on its annual fuel contract involving approximately 600 tons of ¾-in. gas lump or egg coal. Address Pur. Agt. W. M. Moran, the Delphos Gas Co., Delphos, Ohio.

1757—Hattiesburg, Miss.—The Hattiesburg Trading Co. usually contracts for its annual fuel requirements involving approximately 6,000 tons of Kentucky pea and slack and 1,200 tons of No. 2 lump gas coal some time in January. Deliveries are made by rail at the rate of about 600 tons per month and the company has a storage capacity for 800 tons. Address Pur. Agt. H. F. Wheeler, Hattiesburg Trading Co., Hattiesburg, Miss.

1758—Hanover, Ont., Can.—The Hanover Portland Cement Co., Ltd., usually contracts for its annual fuel requirements involving from 12,000 to 15,000 tons of slack, 500 to 1,000 tons of three-quarter lump and 1,000 tons of nut and slack coal some time in January. Deliveries are made by G. T. R.R. via bridge at the rate of about 300 tons per week. Address Pur. Agt. E. D. Greutzner, Hanover Portland Cement Co., Ltd., Hanover, Ont., Can.

1759—Mt. Vernon, Ill.—The Mt. Vernon Car Manufacturing Co. is in the market for its annual fuel requirements comprising screenings and mine-run coal. Address Pur. Agt. Webber, Mt. Vernon Car Manufacturnig Co., Mt. Vernon, Ill.

1760—Cambridge, Mass.—The Cambridge Gas Light Co. usually contracts for its annual fuel requirements some time in January. Mine-run bituminous coal is required. Address Purchasing Agent, Cambridge Gas Light Co., Cambridge, Mass.

1761—Van Wert, Ohio—Bids will be received until noon Dec. 18 for furnishing the local Water-Works Department with coal as may be required during the ensuing year. Deliveries are to be made in carload lots in the bins at the pumping station. A certified check for $50 must accompany each bid and a satisfactory bond will be required from the successful bidder. Address Dir. W. T. Backus, Pub. Service, Van Wert, Ohio.

1762—Columbus, Ga.—Shepherd Brothers at this place usually contract for its annual fuel requirements involving from 5,000 to 6,000 tons of washed steam coal some time in February. The company has storage capacity for 12 cars and deliveries are made by railroad at the rate of about two cars per week. Address Purchasing Agent, Shepherd Brothers, Fifth St. and 10th Ave., Columbus, Ga.

1763—St. Louis, Mo.—The Hamilton Brown Shoe Co. is in the market for the fuel requirements at its Columbia factory, involving approximately 300 tons per month of 2-in. lump coal. Address Purchasing Agent, the Hamilton Brown Shoe Co., St. Louis, Mo.

1764—New York, N. Y.—Bids will be received until noon Dec. 21, for furnishing and delivering 170 tons of range coal as needed to County Clerk's Office and Court House, Richmond; Village Halls at Stapleton and New Brighton; Field Office at St. George and Coroner's Office, New Brighton, and Old Corn Exchange Bank Building, St. George; 565 tons of buckwheat No. 1 to Borough Hall, St. George, to be delivered in 150-ton lots. The range coal is to be delivered in 2- and 5-ton lots. The contract is to be completed during the year beginning Jan. 1. Address Pres. Calvin D. Van Name, Room 18, Borough Hall, New Brighton, Staten Island.

1765—New Orleans, La.—The G. H. Leidenheimer Baking Co. is now in the market for its annual fuel requirements, involving approximately 700 tons of coal. Address G. H. Leidenheimer, G. H. Leidenheimer Baking Co., 1500 S. Franklin St., New Orleans, La.

1766—Philadelphia, Penn.—The Link-Belt Co. is accepting tenders for its annual requirements of buckwheat and rice coal, involving approximately 1,500 tons. The contract becomes effective Jan. 1. Address Purchasing Agent, Link-Belt Co., Nicetown, Philadelphia, Penn.

1767—Camden, N. J.—The Southwark Manufacturing Co. is negotiating for its annual fuel supply, involving approximately 2,500 tons of pea coal. The contract is to run for one year from Jan. 1. Address Secretary Southwark Manufacturing Co., foot of Winslow St., Camden, N. J.

1768—New Orleans, La.—The Pelican Cold Storage and Warehouse Co. is in the market for its annual coal requirements, and will enter a contract shortly. Address Purchasing Agent, Pelican Cold Storage and Warehouse Co., 1561 St. Louis St., New Orleans, La.

1769—New Castle, Del.—The Baldt Steel Co. is in the market for its annual supply of broken coal, involving approximately 1,700 tons. Deliveries are to be made during the year beginning Jan. 1. Address Pur. Agt. G. A. Pederick, Baldt Steel Co., New Castle, Del.

1770—Philadelphia, Penn.—C. O. Struse & Sons, brick manufacturer is in the market for its annual supply of broken coal, involving approximately 2,000 tons, deliveries to be made during the year beginning Jan. 1. Address Purchasing Agent, C. O. Struse & Sons, Manayunk, Philadelphia, Penn.

1771—New Orleans, La.—The Ruddock-Orleans Cypress Co. is in the market for its annual fuel requirements, involving 50 to 60 cars of bituminous coal. Address Purchasing Agent, Ruddock-Orleans Cypress Co., Carrollton Ave. and New Basin, New Orleans, La.

1772—Warrensville, Ohio—The contract for furnishing the Correction Farm at this place, which is usually negotiated at about this time, is being delayed, due to plans that are under consideration for using gas when the current coal contract expires. It is understood on good authority that the administration at the farm will be changed Jan. 1, and in which event it is possible the new officials may reconsider this proposed change. Address Director of Public Welfare, City Hall, Cleveland, Ohio. (No. 57, Vol. 6, p. 189.)

1773—Cheltenham, Penn.—The Ames Shovel and Tool Co. is in the market for its annual supply of buckwheat coal, involving approximately 1,500 tons, to be delivered during the year beginning Jan. 1. Address Purchasing Agent, The Ames Shovel and Tool Co., Cheltenham, Penn.

1774—New Orleans, La.—The American Laundry Co. at this place will be in the market about Jan. 1, for their annual fuel requirements, involving approximately 25,000 tons. Address Pres. Chas. O'Connor, American Laundry Co., Julia and Magazine St., New Orleans, La.

1775—Chester, Penn.—The Crozier Home and Hospital will contract some time during the current month for its annual fuel supply, involving approximately 600 tons of anthracite pea coal. Address Secy. S. K. Ubill, Crozier Home and Hospital, Chester, Penn.

1776—New Orleans, La.—It is reported that the Union Brewing Co. at this place will negotiate its annual fuel contract some time before Jan. 1. Address Purchasing Agent, Union Brewing Co., 2809 N. Robertson St., New Orleans, La.

✚1777—Pittsburgh, Penn.—Bids will be received until noon, Dec. 24, for furnishing the Western Penitentiary of Pennsylvania with coal as may be required at the Pittsburgh Prison, North Side, during the year beginning Jan. 1. Complete specifications and proposal forms may be obtained on application. Address Warden John Francis, Western Penitentiary, Pittsburgh, Penn. (No. 1,578, Vol. 8, p. 700.)

1778—Camden, N. J.—Bids will be received until 8 p.m., Dec. 22, for furnishing the local Water Department with approximately 4,500 gross tons of bituminous coal. All bids should be made f.o.b. cars, Morris Station, N. J., and analysis must accompany each proposal. The coal must be equal to Logan No. 1, or Thorne, Neale & Co.'s Sonman Shaft, South Fork, Miller Vein coal. Each proposal must be accompanied by a certified check for $300. Address Chn. Charles H. Greer, Water Com., Room 11, City Hall, Camden, N. J.

1779—Philadelphia, Penn.—Horrocks & Bro. will contract for their annual supply of buckwheat, involving approximately 3,500 tons, some time during the current month. Deliveries are to be made during the year beginning Jan. 1. Address Purchasing Agent, Horrocks & Bro., Frankford, Philadelphia, Penn.

1780—New Orleans, La.—It is understood that the New Orleans Brewing Co. will soon negotiate a contract for their annual coal supply. Address Purchasing Agent, New Orleans Brewing Co., Jackson and Tchoupitoulas St., New Orleans, La.

1781—Philadelphia, Penn.—The Arnholt & Schaefer Brewing Co. is receiving tenders for its annual fuel supply, involving approximately 2,000 tons of buckwheat and rice coal. Address Purchasing Agent, Arnholt & Schaefer Brewing Co., 31st and Thompson St., Philadelphia, Penn.

1782—New Orleans, La.—The Pelican Cracker Factory will contract for its annual fuel requirements, involving approximately 175 tons of bituminous coal and 50 tons of coke about Jan. 1. Address Pur. Agt. E. L. Gerde, Pelican Cracker Factory, 816 Magazine St., New Orleans, La.

Contracts Awarded

Note—Successful bidders are noted in **bold face** type.

1428—Unionville, Mo.—The contract for furnishing the local Municipal Light and Water Works with coal during the year beginning Dec. 1 (p. 489), has been awarded to the **Iowa Block Coal Co.**, of Exline, Iowa, at $1.35 per ton in the bin at Unionville. The Thistle Coal Co., of Cincinnati, was the next bidder at $1.45 per ton. Address Supt. M. T. Lynn, Municipal Light and Water Works, Unionville, Mo.

1480—Massillon, Ohio—This contract (p. 576), which provides for furnishing the local Public Schools with coal as may be required during the ensuing year, has been awarded to the **Artificial Ice and Coal Co.**, on Goshen coal at the following prices, delivered: Lump, $2.28; mine-run, $1.99; slack, $1.65. Address Clk. Wm. Fielberth, Bd. of Education, Massillon, Ohio.

Marlow & Co.**, on the following basis: Egg, $6.45; stove, $6.95; chestnut, $7.05. Address Sargeant-at-Arms Charles P. Higgins, U. S. Senate, Washington, D. C.

1601—Cameron, Mo.—This contract (p. 736), which provides for furnishing the local Municipal Light and Water Plant with approximately 3,000 tons of coal, has been awarded to **S. L. Evans** at $1.60 per ton for Novinger nut coal, and $2.20 for mine-run, f.o.b. Cameron. Kindig & Gage bid $1.30 for nut and $2.05 for mine-run. Address Clk. Clarence Staples, Cameron, Mo.

1611—Williston, N. D.—This contract (p. 786), which provides for furnishing coal as may be required at the local Court House and Jail during the ensuing year, has been awarded to the **North Western Fuel Co.** on North Dakota lignite coal at $2.45 per ton. Address County Audr. M. H. Aaen, Williston, N. D.

1671—Grand Haven, Mich.—This contract (p. 912), which provides for furnishing the Eagle-Ottawa Leather Co. with approximately 4,000 tons of West Virginia mine-run coal for use at their Grand Haven and Whitehall plants, has been awarded to the **Wyatt Coal Co.** Address B. Peter, The Eagle-Ottawa Leather Co., Grand Haven, Mich.

1672—Madison, Ill.—This contract (p. 912), which provides for furnishing the fuel requirements of the Barber Asphalt

Paving Co., involving about 30 tons per day, has been awarded to the **Mt. Olive & Staunton Coal Co.** The contract expires on Apr. 1 next. Address Pur. Agt. White, Barber Asphalt Paving Co., Madison, Ill. (No. 494, Vol. 7, p. 665.)

1683—Bozeman, Mont—This contract (p. 912), which provides for furnishing the County Board of Commissioners with approximately 100 tons of coal, has been awarded to **J. C. McCarthy,** on Fromberg coal at $4.85 per ton. Other bids were: George Hoover, Bear Creek, $5.35; Kooi, $4.90; Kenyon-Noble Lumber Co., Red Lodge or Bear Creek, $5.25; Fransham Coal Co., $5. Address Clk. E. H. Schumacher, Gallatin County, Bozeman, Mont.

1688—San Antonio, Tex.—This contract (p. 957), which provides for furnishing the St. Anthony Hotel with approximately 40 tons of lignite coal per month, has been awarded to the **Phelon Coal Co.** at $1.75 per ton for lignite coal, delivered in the bins. Address Ch. Engr. Orr, St. Anthony Hotel, San Antonio, Tex.

1699—Columbus Grove, Ohio—This contract (p. 958), which provides for furnishing the Columbus Grove Water-Works with approximately 2,000 tons of coal during the year, beginning Dec. 1, was awarded to the **Sauters Coal Co.** on its Pittsburgh No. 8 Gaylord three-quarter lump coal at $1.10 per ton, f.o.b. mines. Address Clerk Board of Public Works, Columbus, Ohio

1707—Jefferson, Wis.—This contract (p. 958), which provides for furnishing the local Board of Education with approximately 150 tons of West Virginia splint, dock screened coal, to be delivered at the High School and Public Library, has been awarded to the **N. J. Braun Lumber Co.** at $4.50. George Traeger bid $4.49, Fernholy Lumber Co. $4.70, and the Jefferson Brick and Tile Co., $4.80. Address Chn. S. E. Waterbury, Bd. of Edu., Jefferson, Wis.

1710—Cleveland, Ohio—This contract (p. 958), involving a prompt purchase of 200 cars of nut and slack coal, was awarded to the **Bertha Coal Co.** of Pittsburgh, on Pittsburgh coal at $1.95 per ton, f.o.b. Cleveland, Ohio. There were 20 other bidders on this business. Address T. P. Jones, Fuel Agent, Cleveland, Ohio.

1728—Cambridge, Mass.—This contract (p. 999), which provides for furnishing the Cambridge Water Board with approximately 1,000 long tons of coal during the next six months, has been awarded to Coleman Bros. at $4.85 per ton. Address Gen. Supt. Edward W. Quinn, Cambridge Water Works, Cambridge, Mass.

Contract Notes

East St. Louis, Ill.—The Fred Callaghan Coal Co. has contracted with the **Lumaghi Coal Co.** for 200 tons per month of "Cantine" 6-in. lump.

St. Louis, Mo.—The Avery Coal and Mining Co. has concluded a contract to market the output of the Mulberry Hill mine in the Belleville district.

St. Louis, Mo.—The Breese Trenton Coal and Mining Co. has sub-let a portion of its contract with the Terminal Railroad Association to the Kolb Coal Co.

East Indies—An American consular officer in this district reports shortage of coal, and submits the names and addresses of a number of local consumers.

Danielson, Conn.—The Danielson & Plainfield Gas and Electric Co. consumes about 4,000 tons of bituminous coal per annum, which costs approximately $4.25 per ton.

St. Louis, Mo.—The Heinecke Coal Co. has contracted with the **Consolidated Coal Co.** for approximately 600 tons per month of Mt. Olive lump coal, contract to expire Apr. 1.

Madison, Ill.—The Kettle River Co. has contracted with the **Kolb Coal Co.** for approximately 600 tons of "Mascoutah" 2-in. lump coal per month. Address Pur. Agt. H. Gilliam, The Kettle River Co., Madison, Ill.

Madison, Ill.—Kosta & Co. have contracted with the **Heinecke Coal Co.** to cover their requirements until Apr. 1. They will take about 400 tons per month of Worden lump coal. Address Pur. Agt. Kosta, Kosta & Co., Madison, Ill.

Delphos, Ohio—The Delphos Electric Co. is understood to have closed its contract, involving approximately 1,500 tons of West Virginia mine-run at 65c. at the mines. Address Supt. C. K. Beilharz, The Delphos Electric Co., Delphos, Ohio.

Fall River, Mass.—The Arkwright Mills at this place consume approximately 6,000 tons of Pocahontas coal which is delivered by wagon. The company does not contract. Address Treas. Herbert H. Marble, The Arkwright Mills, Fall River, Mass.

St. Louis, Mo.—The Crunden-Martin Woodenware Co. has contracted with the **Peabody Coal Co.** for approximately 200 tons of Hillsboro 2-in. lump coal per month. Address Pur. Agt. Wm. M. Crunden, The Crunden-Martin Woodenware Co., St. Louis, Mo.

Granite City, Ill.—The Granite City Lime and Cement Co. has contracted with the **Lumaghi Coal Co.** for approximately 600 tons of "Cantine" 6-in. lump coal per month. Address Pres. C. W. Eisenmayer, The Granite City Lime and Cement Co., Granite City, Ill.

Bessemer City, N. C.—The Atlas Mfg. Co. at this place consumes about 50 tons of mine-run coal per week. The company has storage capacity for five cars, and deliveries are made by railroad. Address Pur. Agt. A. A. McLean, Jr., Atlas Mfg. Co., Bessemer City, N. C.

New Orleans, La.—The No. 3 plant of the Dixie Ice Manufacturing Co. consumes about 450 tons of lump coal per month which is being bought in the open market at the present time. Address Chf. Engr. J. A. Lamar, The Dixie Ice Manufacturing Co., New Orleans, La.

St. Louis, Mo.—The City Coal Co. has awarded the **Lumaghi Coal Co.** a contract for approximately 1,600 tons per month of "Cantine" lump, and 800 tons of "Black Brier" lump, the contract to expire Apr. 1. Address Secy. and Pur. Agt., P. A. Riley, City Coal Co., St. Louis, Mo.

St. Louis, Mo.—The Union Seed and Fertiliizer Co. will confine their purchases, involving approximately 500 tons of 1½-in. or 2-in. screenings per month to the open market during the balance of this season. Address Pur. Agt. McCullough, The Union Seed and Fertilizer Co., St. Louis, Mo.

St. Louis, Mo.—The contract for furnishing the National Utilization Co. with approximately 200 tons of 2-in. lump and 2-in. screened nut per month, has been awarded to the **Lumaghi Coal Co.** on their "Cantine" coal. Address Gen. Mgr. and Pur. Agt. P. A. Doyle, National Utilization Co., St. Louis, Mo.

St. Louis, Mo.—The contract from furnishing the St. Louis Basket and Box Co. with their annual fuel requirements, involving approximately 400 tons per month at both plants, has been awarded to the **Schroeter Coal Co.** on Breese 2-in. screened lump. Address Pur. Agt. Lehman, St. Louis Basket and Box Co., St. Louis, Mo.

St. Louis, Mo.—The John Reenan Coal Co. has placed a contract with the **Lumaghi Coal Co.** for furnishing 500 tons of "Cantine" 6-in. lump coal per month, and one with the Searles Coal Co. covering its requirements of McClintock lump and egg. Both contracts run until Apr. 1. Address John Reenan Coal Co., St. Louis, Mo.

Granite City, Ill.—The contract for furnishing the Draper Manufacturing Co., with approximately 80 tons of 2-in. screened nut coal per month, awarded to the **Lumaghi Coal Co.,** on their "Cantine" coal (p. 1000), was negotiated at $1.37½ per ton. Address Pres. and Pur. Agt. C. L. Draper, Draper Manufacturing Co., Granite City, Ill.

Louisville, Ky.—Louisville Ry. Co. contracts bi-yearly for their fuel requirements which in 1914 amounted to 116,436 tons of pea and slack coal. Deliveries are made by railroad at the rate of 300 tons per day. The company has bin-storage capacity for 1,800 tons, and practically unlimited capacity in the open. Address Supt. of Motive Power F. H. Miller, Louisville Ry. Co., 326 W. Jefferson St., Louisville, Ky.

Louisville, Ky.—The contract of the Central Coal and Iron Company (p. 1000), involving 1,000 to 1,200 tons of pea and slack coal and covering a period of five years, was awarded to the **Central Coal and Iron Co.** at $1.70 per ton. Other bids were requested on this business, but no other companies would undertake to bid on a contract covering this period. Address Pur. Agt. P. M. O'Reilly, Central Coal and Iron Co. 4th and Market St., Louisville, Ky.

Ensley, Ala.—Bids have been received on the contract for furnishing the Bessemer Fire Brick Co. with approximately 12,000 tons of mine-run coal per annum (p. 960) as follows: Pratt Consolidated Coal and Coke Co., $1.25; Sloss Sheffield Coal and Iron Co., $1.20; Eldorado Coal Mining Co. $1.15; Yolanda Coal and Coke Co. (this bid on nut coal) $1.40. No award has apparently been made. Address Pur. Agt. J. W. Minor, Bessemer Fire Brick Co., Ensley, Ala.

Indianapolis, Ind.—The contract for furnishing the County Infirmary with approximately 1,600 tons of Greene County, No. 4 .coal, has been awarded to the **Globe Coal Co.** at $1.84 per ton. This company also received further awards on this business as follows: 50 tons of Hocking Valley $2.95; 50 tons of Ohio Jackson $3.65; 700 tons for the Workhouse on Greene County No. 4 at $1.79; 1,500 tons for Marion County Asylum at Julietta, Green County No. 4 $2.09. **A. B. Meyer & Co.** obtained the contract for the Detention Home at $4.90 per ton for 75 tons of Pocahontas and $5.65 per ton for 10 tons of coke. Address County Infirmary, Indianapolis, Ind.

Financial Department

Geo. B. Newton Coal Co., Philadelphia

Pres. Samuel B. Crowell reports in substance for the half year ended Apr. 30, 1915:

The net quick assets on Apr. 30, 1915 aggregated $613.030 and the net assets $2,113,113; deducting $61,250 for the dividend declared Apr. 26, 1915, on the first pref. stock, and $17,500 for sinking fund, the actual net quick assets on said date were $534,280. While the said net quick assets are still below the sum of $600,000 contemplated by the by-laws, they show an increase of $97,169 over the corresponding item on Oct. 31, 1914. The total net assets show an increase of $31,476 over Oct. 31, 1914.

Exclusive of the first pref. stock about to be acquired with the $20,885 now available, the company has since organization acquired $94,700 of first pref. stock, which is held in the sinking fund, and the dividends on which will be added to the sinking fund.

In view of the general business depression existing during the last six months, particularly in the manufacturing districts, we consider that the company's showing for the period in question is good.

BALANCE SHEET (INCL. B. ROWLAND & BRO., INC.)

Assets	Apr. 30, 1915 $	Oct. 31, 1914 $	Liabilities	Apr. 30, 1915 $	Oct. 31, 1914 $

Total	6,463,961	6,528,201	Total	6,463,961	6,528,201

a Includes April 30, 1915, real estate, $712,411; buildings and improvements, $425,333; machinery, tools and scales, $142,719; horses, wagons and harness, $431,993; and furniture and fixtures, $35,159. b Includes April 30, 1915, special surplus (sinking fund), $74,445; provision for 1st pref. dividend, $61,250; provision for sinking fund, $17,500, and undistributed profits, $52,992.

Lehigh Valley Coal Co.

This company reports for the fiscal year ending June 30, 1915, as follows:

Results—The conditions in the anthracite trade have not been very satisfactory because of the mild weather which has prevailed during the past several winters. While the tonnage mined shows a slight increase over the preceding year, all of the increase was made in the first six months. The second half of the year shows a decrease as compared with the same period a year ago. Our total net income from all sources, after deducting charges for royalties, sinking funds, depreciation and interest on funded debt, amounted to $1,022,815, an increase of $457,955.

Coal Output—The production of anthracite coal from the lands owned and leased by Lehigh Valley Coal Co., including that mined by tenants, was 8,088,901 gross tons, an increase of 211,511 tons. The percentage of sizes above pea produced by the mining operations of the company was 65.41%, a decrease of 1.05%. The bituminous coal mined from the Snow Shoe lands, located in Centre County, Penn., amounted to 258,205 gross tons, an increase of 5,474 tons.

Additions, Etc.—The property was fully maintained and $517,542 was expended for additions and betterments. The steel fireproof breaker at Packer No. 5 colliery was completed and is now in successful operation. At Packer No. 4 colliery the alterations to the breaker and the concentration of the underground pumping are well under way. To reduce still further danger by fire, a complete spray system was introduced at each of the frame breakers, effecting a substantial reduction in the premiums paid for fire insurance.

Prospecting on the Broadwell lands in Lackawanna County is now in progress with a view to commencing mining operations thereon and taking the coal to Heidelberg colliery for preparation.

The operations on the bituminous coal lands at Snow Shoe are being steadily developed to permit of greater efficiency. As soon as the power line, now under construction, is completed, electric haulage will be substituted for mules and electric coal cutting machinery will be introduced in place of pick mining.

The properties at West Harrison St., Chicago, and Fillmore Ave., Buffalo, were sold during the year.

Suit—Included in the cash on hand is the sum of $678,085, representing an amount set aside on account of the special Pennsylvania tax of 2½% of the value of the coal mined. The constitutionality of this law has not as yet been decided by the courts.

Sinking Funds, Etc.—By the sinking fund, $404,000 Delano Land Co. first mortgage 5% bonds were purchased and canceled, reducing the fixed charges by $20,200 a year. "Deferred real estate payments," representing short-term notes given for property in prior years, have been reduced by $100,000. Payments amounting to $112,804 were made to the sinking funds of our various mortgages.

Current Assets—These are $3,521,901 in excess of current liabilities.

Note—For previous annual report of this company see Vol. 6, p. 1010.

Byproduct Coke Corporation

* From the undivided earnings as shown above, $450,335, there was deducted $6,580 for bonus to employees, leaving a balance to be carried forward of $404,788.

New England Gas & Coke Co.—Mild weather and poor general business so affected the market for coke that sales of coke and the profits therefrom fell off materially during the year ended June 30. As a result the company paid a dividend of only 3½% for the year as against a dividend of 4½% in 1913-14. The new coal-crushing plant was completed and put in operation. There was also put in operation a new modern coke-crusher.

New England Coal & Coke Co.—During the year ended June 30, 1915, the company sold and delivered approximately 3,424,000 gross tons of coal, an increase of some 651,000 gross tons over the previous year. The Coke Co. paid during the year a dividend of 10% and an extra dividend of 10% on its capital stock. [In 1913-14 paid 10% and 30% extra.] The usual liberal allowances were made for depreciation.

The New England coal market in the year ending June 30, 1915, was far from satisfactory, due to the continuation of poor conditions of general business. Water freights, however, since August 1, 1915, coastwise and particularly off shore, have shown considerable advance due to the war. The company has been able to charter one of its steamers constantly and another steamer intermittently since Jan., 1915, thus securing a share of the high off-shore freights.

During the year the company purchased the ocean-going fleet of the Commercial Tow Boat Co., consisting of two tugs and nine barges. It also purchased the steamers Arlington and Brandon, each of 3,000 gross tons cargo capacity, and has had them altered for the coastwise coal trade. They are now in service between Hampton Roads and New England ports.

During the year arrangements were consummated with the New River Coal Co., whereby this company is assured for a term of years a large supply of high-grade New River coal for shipment to the New England market.

COAL AGE

Vol. 8 NEW YORK, DECEMBER 25, 1915 No. 26

Never Again!

FRANKLIN SAID: *Resolve to perform what you ought.*
Perform without fail what you resolve.

THE time has come to sweep out the corners, brush down the cobwebs, oil the machinery and brighten the brass And this doesn't mean only engines and things made of steel, but rather the equipment of the human body.

What man is there who will start the new year without first taking an inventory of himself and then resolving to correct his faults? Every one of us knows some places where he has failed, and it's a poor sort of human who doesn't intend to make 1916 a better year than the one just closing.

If we lack health, there is one remedy that overtops all others—an orderly life. Yesterday we read the story of a great man who was given up to die when 40, but by eliminating bad habits and bad food he lived to be over 100 years old, having written a valuable book at the age of 83. When past 90, he said: "The food from which a man abstains after he has eaten heartily is of more benefit to him than that which he has eaten." How true it is !

Health is the first essential of success. Therefore our initial resolve should be to lead a temperate life. The story of the man referred to teaches that we can overcome physical handicaps at any age, provided we conquer ourselves and exercise absolute self-control.

After good health we need hope and ambition. There are no insurmountable walls of caste in America that prevent our reaching the highest offices in the land. Our greatest President was a rail-splitter. Our foremost merchant was clerking in a country store at the age of 18. Our most famous scientist, Thomas Edison, went to school but two months, having started to work when 11 years old. Edison said: "The majority of people are burning up one hundred horsepower of fuel in their bodies and taking out only eight horsepower of work."

No man's character will ever rise higher than his aims. If we are content to be nobody, we need not hope ever to be somebody. To succeed a man must be able to lose himself in his work. If a thing is not right, he must not do it; if it is not true, he must not say it. If he would command respect, he must command his temper. If he would attain independence, he must not forget that the best time to practice economy is before he has to. Last of all, he must remember that his companions are his mirror, for a fellow is known by the company he keeps.

For 1916

IN *making your resolves finally, be sure to record them and remember it's the* KEEPING *and not the "making" of good resolutions that is important in developing one's will and in shaping one's life.*

If you want to make 1916 the best year of your life, tabulate your worries and then proceed to determine what causes them. If you are not succeeding in your work, *write down why.* The chief idea is to *write it down*

When you have found out what the trouble is, don't act hastily. Spend a few days thinking it over and spend some of the time alone. The eagle is a great old bird, and one of his finest virtues is his ability to stand solitude.

Sealing Off Mine Fires*

By Joseph Cain†

SYNOPSIS—Fires usually originate at the working face. If they have gained headway, they may become inaccessible and must be sealed off. The construction of the seals as well as their ultimate removal requires great care and vigilance.

The following is a record of the methods used in overcoming no less than 23 mine fires which came within my personal experience and which required more than the ordinary agencies, water and dirt, to put out.

The last of the 23 happened as late as Aug. 2, 1915, and was, like the others referred to, extinguished without stopping the mine except in the district directly involved.

The fire of Aug. 2, 1915, started by the ignition of a gas feeder in the firing of shots in the advanced workings embracing five working places, namely, three entries and two crosscuts, 6 ft. high and between 10 and 12 ft. wide (see Fig. 1). It may here be explained that all places where shots are fired by regular shot firers are examined within two hours after shooting. The shot inspector on making his rounds travels with the intake current. Occasionally he crosses to the main return of any one district to note the conditions of the return air. On this occasion he found the odor of smoke that was not powder smoke and following up the return became fully assured that a fire existed.

His efforts to reach the fire having failed he hurried for help and advised the writer by 'phone. While a crew of workmen was being organized and preparations made for materials, we made a careful inspection of the trouble. We first tested the return at intervals, using safety lamps only. On reaching a point where smoke, fumes and heat became unbearable and it was unsafe to go farther, we decided to seal up the fire zone.

Only a Small Amount of Air Was Allowed to Reach the Fire

In the meantime we short-circuited quite a large portion of the intake current to prevent the entire volume of air reaching the fire. This would enable us to curtain off each of the working districts as near to the fire as possible, so as to prevent the smoke and fumes going to each of these districts and confine all the smoke to one return. We next hurried to the outside and other portions of the mine to obtain the necessary material for sealing. This material consisted of lumber, nails, ducking, tools, two kinds of clay, all available safety lamps, 75 ft. of rope and quite a quantity of drinking water. All material was taken in on the main intake side.

A watchman was placed at the fan and another at the first opening to the main return, so as to prevent anyone entering. The other employees were divided as follows: Two to get the lumber to the sealing location, one to procure the clay, one the water, one to mix the clay properly, two to saw the lumber to the desired lengths and two to prepare the place for the sealing. No naked lights were allowed at or near these places.

In the meantime a further inspection was made, the inspectors going as near to the fire as possible and testing the three openings leading to it, in order that the work of sealing should be done in the surest, safest and quickest manner possible. On the intake side we were able to reach a point near enough to hear the roaring, crackling sound of the fire; we were able to remain here but a moment.

To do this I, with the mine foreman 20 ft. behind, crawled on hands and knees under the smoke. We found the heat unbearable and unbreathable; the roof was falling in thick flakes and water dripping similar to a light rain. We found no showing of gas on the lamp, but we had to use care in handling this instrument to keep it from going out.

Further investigation proving fruitless we returned to seal up, beginning at the intake side. Fig. 1 shows the location, and Fig. 2 the plan and method of constructing the first seal. By this time we had ascertained the number of shots blasted and the approximate amount of loose coal exposed to the fire; thus we had a fairly definite idea of the extent of the trouble.

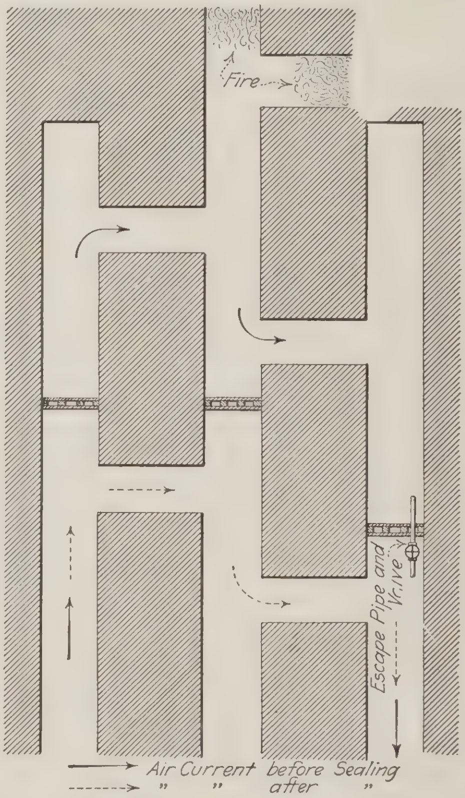

FIG. 1. SHOWING LOCATION OF FIRES AND THE THREE SEALS

All Stoppings Are Similar in Construction

The stopping in the second opening to the fire was constructed like the first. In case of mine fires in general it is not always possible to secure readily 10x10-in. posts or 2-in. planks, hence we sometimes have to use 6x6-in. posts and 1-in. or 1½-in. planks. In the case of 1-in. planks we double over the walls, making sure to break joints at the cracks. In case 1½-in. planks are used we batten the cracks on both sides of both walls with narrow 1-in. lumber. After a stopping is complete water is kept at hand to sprinkle the walls daily to keep the heat from cracking both the clay and the wood. In the event that there is a seepage of gas, this is easily detected by its odor and tendency to put the light out, when this is held near to the floor. If we cannot stop the leak by an additional layer of stiff clay, we proceed to dig out for and build up another wall with clay filling, tightly packed between the new and old walls.

---

*Paper read before the Kentucky Mining Institute, Dec. 3, 1915.

†Mine superintendent, Stearns Coal and Lumber Co., Stearns, Ky.

In the construction of each seal we allow no more air to reach the workmen than is necessary to hold the smoke back. To gain time we start the second seal before we have completed the first. We have one man keep watch of the smoke, for if a fall of roof takes place at or near the fire, if the fan should stop or any disarrangement of the main intake current occur, the smoke would back out in spite of the fact that the return from this fire is yet open. The fact is a roof fall may occur at or near the fire, the sound of which may not reach the workmen as soon as the smoke, hence the necessity of one person watching for these disturbances.

In the case of the fire mentioned after completing the first and second seals with the exception of the plastering or finishing touches, we hurried to the third and last one. Here is where trouble and danger and all kinds of annoyances are met; here is where things happen that are more or less unexpected. No two fires act alike in the work of the last sealing, hence each man taking part in this work has to be on the alert. The most experienced man has nothing to do but watch and guide the others, if sick men or something worse is to be prevented.

A Difference of Opinion

Mining men differ as to which point should be sealed up last, but as stated in the beginning of this paper, from the experience of sealing up 23 fires and the fighting of 11 others which did not require sealing up, I firmly believe that the least evils are encountered by leaving the return side to be last sealed.

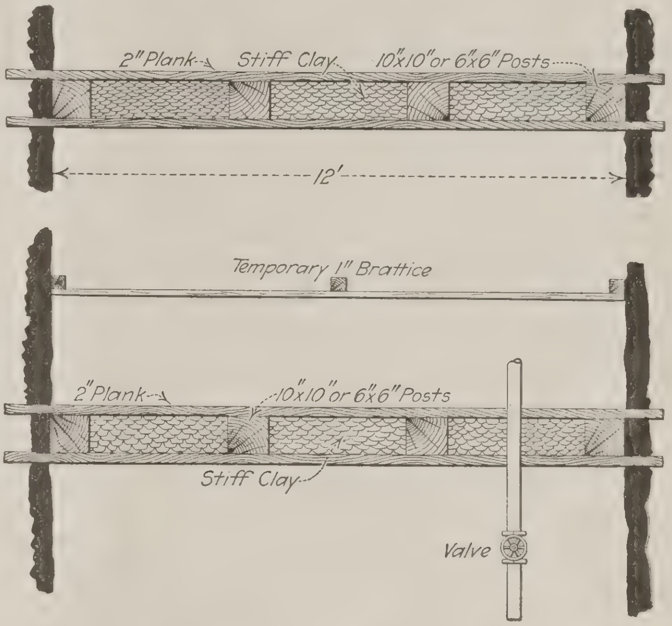
If, however, there are several openings to the fire to be closed and by oversight or delay the fire has made great headway or if a strong feeder of gas is the cause of such a fire and the sealing up is undertaken quite a distance back, I would seriously consider whether or not the return should be sealed up first.

The following points should be kept in mind when a fire occurs: Catch the fire as near to the time of its origin as possible; put it out by the direct method, if feasible and safe to do so; never allow a gas feeder of any size discharging its gas back of the advanced working face to continue to reach the working face, even though you may be able to dilute it with the air-current to a point below the explosive mixture. There may come a time when you will wish you had conducted it to the return direct from the fissure. Seal up as close to the fire as possible. Don't allow any more air at the place where the seal is to be made than is needed. Direct this air by brattice or curtains close around the workmen. Compel the men to do their work overhand and do not allow them to get their heads to the roof and inhale an overdose of smoke.

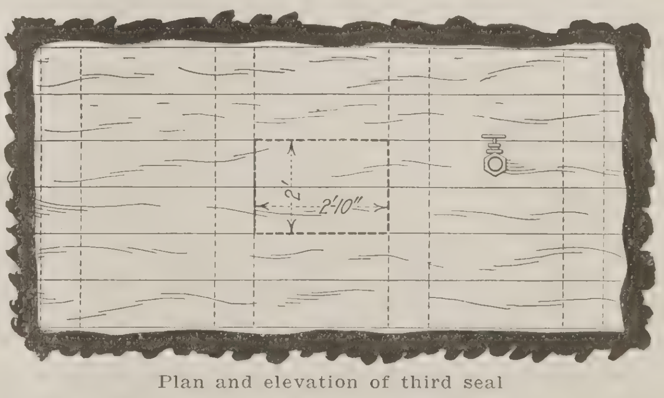
I have never yet thought it advisable to start sealing up the return from a fire first, for that would tend to make all sealing up places the return and, as stated above, erecting the last seal is a tough job which must be done with fresh men with their minds on the alert for danger. The man who has only read about sealing up a fire is likely to find himself in the wrong place.

Erecting the Seal in the Return

In erecting the last seal I proceed about as follows: Have everything ready and handy. Run up a frame curtain or rough brattice on the inby side of the complete sealing location; try to keep the smoke back (this is a difficult job) in one way or another to help the workmen. Work about two men for 15 min. at a time; run the main seal up in sections from the bottom upward; run up both partitions simultaneously, the clay wall included. Pack the stiff clay tight with pressure; have a stick in your hand to tap the first man who raises his head too high into the thick smoke. Insert the escape pipe with valve and locate it to one side and one-third or halfway above the floor (see Fig. 3).



Plan of first and second seals



Plan and elevation of third seal

FIG. 2. CONSTRUCTION OF THE THREE SEALS

When every place leading to the fire is sealed, remove all check affecting ventilation to this point, allowing the largest available amount of air to pass through the open breakthroughs and to all working places, so as to sweep out all smoke and gases that may have reached these points during the time the air has been restricted in them. In due time inspect all places to see whether O. K. and fit to work.

Near the return seal where the escape valve and pipe are located, an easily constructed brattice or curtain with a small door made of ducking or canvas is put up in front of the pipe so as to be able to test the gas coming from the fire area. This test may be made every evening after all workmen have left the mine.

With the curtain door down and the valve partly open, test the place as you test for gas. The fact is you will find no gas to show a cap for the first three or four days, but on bringing your lamp down to the floor near the end of the pipe you will find a gas that will put out the light at once. This will be found for three or four days. About the fourth day you can get a cap showing on your lamp. This showing will get stronger each day, and during the night, while no one is at work on the return side, you will leave the valve open for several hours. The showing of gas will become stronger from day to day, finally developing a cap on the lamp when held some distance from the pipe.

The Gas Shows When the Fire Is Out

From the indication of the gas from the pipe you can determine when it is proper to open the sealed area. In my experience, with one exception, 17 days was sufficient to smother the fire. In one case it was not out and we had to close it up again. This was because in this case we had to do our sealing some 500 ft. back from the fire, hence we closed in considerable air which supported combustion. In unsealing it is my experience that it is best to proceed as follows: We curtain off all other districts so as to prevent the escaping gases from reaching them and to confine the return from the fire to one aircourse, so that an inspection may be made. We then close up the crosscut brattice, leaving a curtained manhole 3x4 ft. The four thicknesses of curtain are held up until we quickly knock out a 34x24-in. opening. There must be no lights, not even a safety lamp, in line with this return, even though a full air current is passing nearby. One man is left to complete the opening in this seal.

As soon as the 34x24-in. opening is made we proceed to the first or intake, seal. The 3x4-ft. four-thickness curtain is dropped down over the opening in the crosscut. The air current then passes through to the heretofore closed-up fire area.

With the air current connection now made certain we leave this district, placing one man with a safety lamp at the first easy opening to the return, or about 400 ft. outward. Another man is stationed at a similar place and distance outward, as is also a third, while the fourth man passes along this distance and takes the record of the tests now made in this return from each man. The lamp test in each case is made with great care and at intervals of 10 to 15 min.

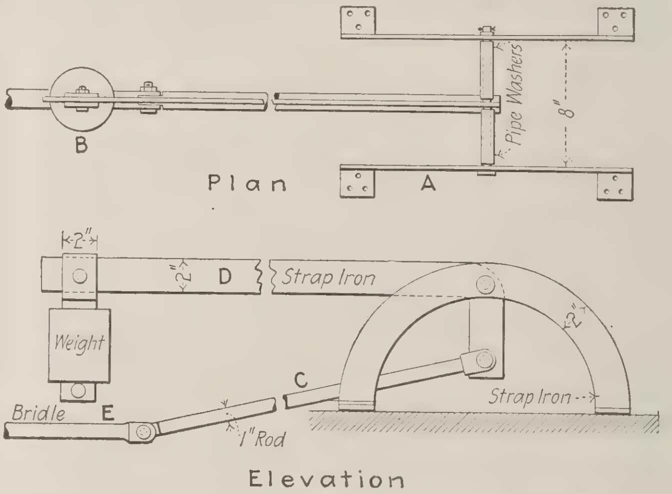
In the case of the fire above mentioned our findings were about as follows: It should be remembered that some 7,000 cu.ft. of air was passing through the fire area per minute with almost a direct return to the fan at each place. When making a test, a man unavoidably allowed a small quantity of the intake to bypass, correspondingly lessening the amount passing through the opened up seal. For the first 65 min. the gas in the return was strong enough to show a quick sharp cap even near the floor, often so quick that it would put the light out before the lamp could be removed. In making the first test it was no trouble to get a cap on the flame for a full 45 min., even on the bottom. After this time had passed no showing of gas was possible. In due time two of us traveled the return as far as the return seal. We then went through the seal on the intake side, making a full inspection as far as the fallen roof would allow.

The opening and places on the intake side as well as the return on last sealing side were not seriously damaged by fallen roof, but the center opening was much damaged, roof having fallen nearly roof high. Nowhere were we able to reach or see the burned coal until we had removed, through several hours' work, considerable fallen roof.

A Weight-Operated Switch

The accompanying drawing shows a weight-operated switch, which is a good substitute for the ordinary device of this kind, which is spring-operated. Being simple in construction, it can be made by any mine blacksmith. It is reliable in operation and will work successfully on any passway or sidetrack where a device of this kind is required.

As may be seen in the drawing, the bridle bar *E* is joined to the connecting rod *C*, which is attached to the bell crank *D*, which pivots between the quadrants *A*. On the horizontal end of the bell crank is attached the weight *B*. It will be thus seen that the weight *B* exerts a continuous force on the bridle bar in a manner exactly similar to the spring on the ordinary switch.



DETAILS OF THE SWITCH-OPERATING MECHANISM

In installing this switch care should be taken to set the quadrant *A* sufficiently away from the track, so that the weight *B* may readily clear the motor and trucks. The rod *C* must therefore be somewhat longer than the long arm of the bell crank *D*.

Future Mining Plants From the Engineer's Standpoint*

By O. G. Petersen†

SYNOPSIS—The keynote of future installations will be simplicity. The elimination of all unnecessary appliances and particularly the avoidance of superfluous parts in necessary equipment will do much to lessen the cost of the mine output as well as increase the safety of the operative.

The word simplification will express the trend of all mining plants of the future. The consistent application of this idea to the plant as a whole, and more particularly to the component parts, will bring results in continuity of operation, cheapness of product and what is becoming daily more imperative than either, freedom from accident to operatives.

As one visits various sections of the country, attempts at individual improvement by cutting out some unnecessary step are to be noticed. But to go at the problem boldly, to ruthlessly cut out beautifully running wheels flashing steel shafts and other swiftly moving whirligigs that go so far to make the plant look as though it were doing something, takes courage above the ordinary.

Let us not at once assume that a simple plant is consequently a cheap one in first installation costs. The very process of cutting out numberless inconsequential members brings one's attention to weaknesses in the fundamental outline calling for increase of strength at those points.

Looking at a plant from a combined investment and operating standpoint, say total investment and operating costs for a period of 20 yr., the simple, sturdy plant rises head and shoulders above the others.

The most direct way of bringing out the points stated will be to outline in brief terms the essential features of a mining plant for producing from 1,000 to 3,000 tons per day, with particular reference to the mining conditions found in most regions of Kentucky and adjacent territory.

I believe it is generally agreed that central power for mining-plant operation is the first pronounced step toward the simplification of such an equipment.

Power Unpurchasable Must Be Generated

An operation so situated that it cannot purchase power from the central station will have to do the next best thing, namely, operate its own power plant. By adopting some well-tried but little-used principles, the operator can not only generate remarkably cheap power, but simultaneously increase the market value of his product in a surprising manner. We have all realized most keenly to what bottomless depths the price of nut and slack fell during the past spring and summer. By the simple process of using equipment to consume all of the dust and screenings passing through a 1/4-in. circular perforation we immediately prepare a product that is welcomed in the general fuel market.

To begin with power plant boilers of the most rugged design should be installed, with steam pressures not less than 150 lb. and preferably 200 to 250 lb. The dust and fine coal should be brought from the screens by means of a conveyor, pulverized to an impalpable dust, mixed with the proper proportion of air and burned under the boilers exactly as gas is. This immediately removes stoker investment and repair charges. Through means recently perfected, fire-brick trouble incident to gas firing has been entirely eliminated. Removal of ashes from the boilers should be through a compartment entirely separated from the boiler room, and where the situation permits, the ash-removal apparatus should consist of nothing but a stream of water flowing in a concrete trough.

The boilers should be fed by means of turbine pumps. The steam piping should be of the simplest and most direct type, and the turbines of the noncondensing variety driving alternating-current generators. To keep the operating force to a minimum the boilers and turbines should be installed in a single room without any partitions whatever.

Coal Should Be Received Without Breakage

The coal preparation plant should be of a type receiving without breakage from nine cars that need to be neither uncoupled nor stopped for weighing or dumping. In other words it shall be a type in which there is no tipple crew and in which all operations of weighing, dumping and recording of weights are accomplished by the simple act of having the haulage motor pull the trip of mine cars across the tipple.

Other features of coal preparation and loading, such as a screen capable of producing any size that the market in any section of the country may demand without stoppage or interruption for changing from one size to another, the rescreening of the larger sizes after the first separation has been accomplished, the lowering of the sized coal to the car without breakage, the control of the movement of the railroad cars under the tipple—all these are too well established to require special comment.

Coming now to the matter of haulage and a consideration of the dangers arising from bare conductors, both trolley and power wires, particularly in mines operating in a low coal measure, the wonderful improvement of the past two years in storage-battery haulage equipment seems to point ultimately to the adoption of this system for all handling of mine cars, be it in the placing and gathering of the individual car at the room or the haulage of the assembled train to the tipple.

In the distribution of power inside the mines, whether for ventilating, pumping or the operation of coal cutters, the double idea of continuity of operation and absolute freedom from contact with live conductors seems to point to lead-covered cable protected by a steel conduit, the latter being laid alongside the mine tracks. At once all delays owing to poorly put-up hangers, insulators falling on account of soft top and conductors knocked down by falling slate are eliminated. The steel conduit will prevent accidental cutting of cable and consequent electrical troubles.

---

*Paper read before the Kentucky Mining Institute, Dec. 4, 1915.

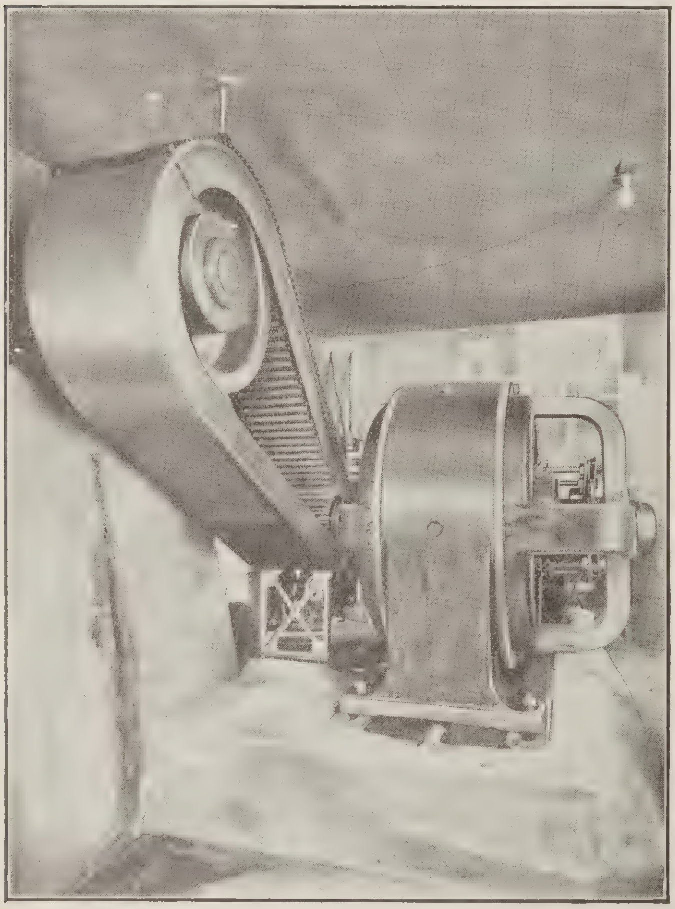
†Associated Engineering Co., Somerset, Ky.

In the matter of undercutting coal, with the heavy investments for repair parts which must be carried in stock, there is not an operator living who has not dreamed of the day when someone would develop a machine for undercutting coal which shall not have more than one moving member and of such weight that it can be easily taken about the mines and operated at the face by one man.

To put the whole matter in a nutshell: The mine having the fewest mechanical and electrical devices, and each device consisting of the least number of parts, all consistent with labor and output conditions, will be the goal we are striving to attain.

Silent Chains in Ventilation

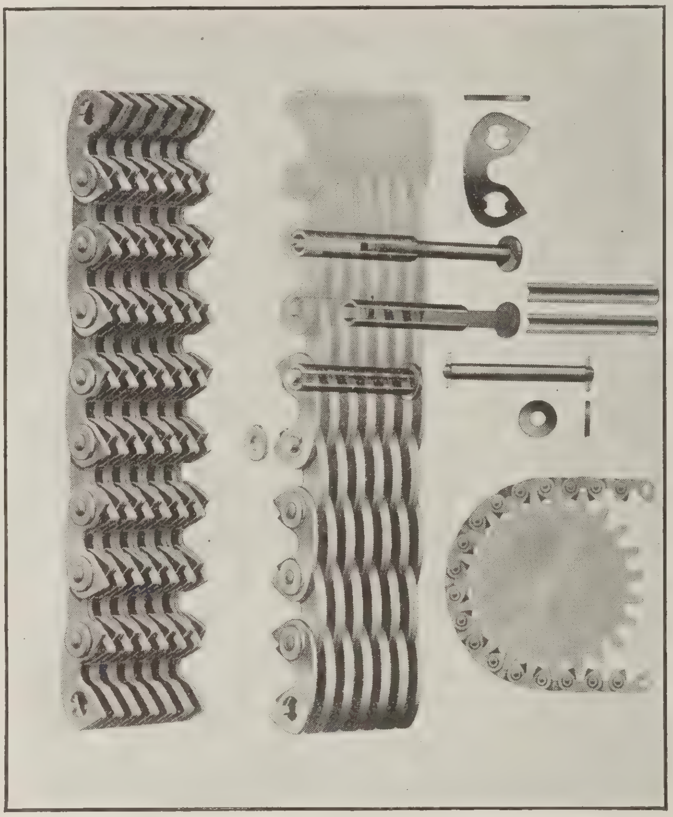
One of the major ideas in modern mining is safety. To attain this end, particularly in coal mining, careful attention must be given to adequate ventilation. Fans and motors were long ago brought to a high state of development, but only within comparatively recent years has careful attention been given to simple, positive, reliable and efficient means of transmitting power between the fan shaft and the shaft of the machine that drives it.



A SILENT-CHAIN FAN DRIVE

Where no change of speed is necessary between the two shafts, a flexible coupling is the simplest and most satisfactory connection. Where the rapidity of rotation of the two shafts is necessarily different, few if any means for transmitting motion exceed the silent chain in simplicity, reliability and positiveness of action.

The silent chain drive as built and sold by the Link-Belt Co., of Chicago, Indianapolis and Philadelphia combines the positiveness and reliability of the spur gear with the flexibility of the sprocket chain. Each drive consists of two cut-tooth sprockets and a carefully constructed steel-link chain. The sprockets are formed and finished by special cutters so that the contour of the teeth will operate to best advantage with the links of the chain and so that sliding, with its unavoidable frictional losses, is reduced to a minimum.



DETAILS OF SILENT-CHAIN CONSTRUCTION

The joints in the chain are made of case-hardened steel pins and semicircular case-hardened steel bushings keyed in the eyes of the links and extending the full width of the chain. This gives an unbroken bearing surface for the full pin length. Long life is assured in a joint of this construction by the area and character of the bearing surfaces. Furthermore, since the links are symmetrical in design, the chain will run equally well in either direction. Additional wearing value is thus secured.

The silent chain is highly efficient, tests having shown as high as 98 per cent. This high efficiency results from the fact that there is no movement of the links relative to the teeth when contact has once been made between them, each portion of the links running at the same speed as the part of the sprocket with which it is in contact.

Because of the entire absence of sliding or rolling action between the links and sprockets, there is also none of the objectionable noise usually accompanying the use of spur gearing, particularly at high speeds.

A drive of this character may be operated with a slack chain. This obviates undue journal friction incident to the use of belts or rope drives and results in decreased friction and a considerable saving in power.

West Virginia Coal Institute

SYNOPSIS—A successful meeting at which nine interesting papers were read was held in Fairmont, W. Va., on Dec. 8 and 9.

The West Virginia Coal Mining Institute held its sixteenth semiannual meeting in the assembly room of the Watson Building, Fairmont, W. Va., on Wednesday, Dec. 8, and Thursday, Dec. 9. On the first day about 50 persons were present and on the second about 100 attended.

The meeting opened at 10 a.m. on Wednesday with a paper by R. Z. Virgin, of Colliers, W. Va., on "The Relation of Mine Officials to the Consumer." Mr. Virgin pointed out that the mine officials and miners were in the end working for the consumer who paid for the coal rather than for the operator who was really merely a middleman. It was necessary to supply the consumer with good coal if orders were to come in steadily.

In the discussion he said that leaky railroad cars for the transportation of slack should not be made tight by the use of props or planks, which make unloading difficult, but rather with paper and excelsior. The company store at his mines being near the loading point, the loaders could easily obtain the material for making the cars tight. J. C. McKinley instanced one mine where hay was used for this purpose at $21 per ton, whereas straw at $6 would have served the purpose equally well.

The next paper was by J. R. Cameron, of Cincinnati, Ohio, and was entitled "Why Buy a Storage-Battery Locomotive?" Mr. Cameron was "neutral in thought and speech" and left the hearers to draw their own conclusions.

A discussion then took place as to whose duty it was to take care of water when the owner of a lower property got over the line and drained the dipping working of the man who owned the adjacent higher property. The matter was really more one for lawyers than for a body of engineers and other mine officials, so no answer was forthcoming.

Provisions of Compensation Act Discussed

The matter of workmen's compensation then received some consideration. It is necessary for the physician, the operator and the injured man to file affidavits testifying to any accident. In some cases ignorant men failed to make their statements, partly because of their illiteracy, partly because they did not realize the necessity, partly from inability to declare the nature of their accident and more often because a notary public was hard to secure. In many cases the men were too severely hurt to travel to the notary and too poor to pay one for making a trip to the bedside in the mining village. Thus the claim was not satisfactorily filed. Some operators, J. B. Hanford, of the Elkins Coal and Coke Co., among them, had provided for this difficulty since the law had gone into effect by securing notarial powers for someone residing in the mining village.

R. Z. Virgin, a superintendent of the West Virginia-Pittsburgh Coal Co., at Colliers, W. Va., said that the present system of not making partial payments is unfair to the workingman. It is not right to leave the compensation unpaid until the man returns to the mine. Such a long delay means one of two things—either the company must advance the money and run a risk of losing it or else the man will starve.

In the afternoon R. J. Beaman, of Cincinnati, Ohio, read a paper on "Uniform Accounting and Cost Records as Applied to Mining." I. C. White, the former state geologist, declared that the individuals of the Federal Trade Commission had decided in favor of uniform accounting for all coal companies doing an interstate business; that is, mining coal in one state and marketing all or a part of it in another. The commission had, he declared, the power to demand this uniformity in the keeping of accounts, but it would rely on moral suasion. It would supply experts to aid in the conversion of the accounts to the new basis, not charging anything for the service except the actual expenses incurred by the experts.

Some Concerns Do Not Know Costs Within 50c.

Some concerns, he said, had such a loose way of figuring mining costs that they did not know within 25c. or 50c. what was the real cost of their coal at the tipple. They overlooked entirely depletion, depreciation, obsolescence, the life limit of the mine, the loss due to accidents and the hazards of the industry, thus blindly basing the cost on the payroll expense. He urged that a knowledge of the real costs would make the operator more careful to sell always at a price that would yield him an assured return.

Under the head of depreciation due to the industry the author of the article brought out the fact that a plant which was established and capable of continuing in operation might well become inoperable because the haul would become so great. The machinery and the heading work might continue to have an ability to handle coal, but it would be necessary to sell or transfer the first and close down the second because coal could no longer be handled at a profit.

J. B. Hanford wanted to know what that haulage limit was. He was of the opinion that his hauls, from an economic standpoint, were constantly getting shorter. In the earlier days of the mine the equipment, both of track and motive power, was so inferior that the cost of haulage was really higher than he could secure, now that he had laid his main haulages with 60 lb. rails and had installed new equipment which would handle the tonnage with much greater facility.

W. E. Fohl, of Pittsburgh, thought that the haulage did not determine the "cruising radius" of the mine. This was determined by the acreage with which the operator felt able to burden himself rather than on the length of haul. The coal-mine owner could not profitably pay interest and taxes and expend the money for testing more than a certain territory of coal for any single operation. So the depreciation described as due to the industry was due always rather to the restricting action of acreage than to the limitations on a profitable coal haul.

Mr. Fohl also suggested that it would be well if a committee was formed in every district to discover the exact cost of mining coal at all the mines in the district. These results could be tabulated, the various statements, however, of the companies supplying the information being kept entirely secret. In this way the members of any one district would know what was the safe and sane price to charge for a ton of coal.

Several members thought that any system of accounting which failed entirely to consider the increase in the value of coal land led to incorrect assessment of costs. They said that many mines might keep accounts as Mr. Beaman proposed and might figure they were selling at a loss, whereas as a whole they would be doing well, for the coal in the hill, while depleted in quantity by mining, would be growing in value by reason of the increase in the selling price of what remained. This Mr. Beaman regarded as a change in speculative rather than in investment value.

It was pointed out that if two men had tracts of equal value, and one man had bought his coal years ago at $5 per acre and another recently at $150, the two men figuring the cost of production by Mr. Beaman's method would arrive at entirely different results and would probably sell at very discrepant prices. It seemed advisable to figure depletion rates at present coal values and not at purchasing value.

Some, however, disregarding depletion since it is balanced by increased values, took an entirely opposite point of view. They argued that the production costs could be figured as helped by the progressive increment in the value of the coal remaining, thus justifying a lower selling price, a point of view diametrically opposed to the ideas of those who think that the increased value should be correctly mirrored in higher production costs.

Depletion Charge Not to Be Ignored

But evidently this last view is wrong, because better than selling for a price which would not allow for depletion an operator would do well to shut down entirely and gain his increment not only on the unmined reserves but on the coal which, if he had been working, he would have mined.

J. B. Hanford declared that at his mines the depletion on coal land was figured at its actual cost plus the interest, the taxes from the date of purchase and the drilling expense. Thus the depletion charge, far from being constant, varied with the particular area mined.

R. D. Hall said that the accountants when considering the value of a new plant figured only the labor and material put into it and did not allow interest for the period of installation. A shaft that took a year to build should be carried on the books at cost plus a half-year's interest even if sunk by the owner. It was worth no less if he built it than it would be had a contractor sunk it, and such a contractor would look to draw interest on the period of construction, though it would appear probably not as a stated item. It would certainly be in the mind of the bidder and would appear unquestionably on his private cost sheet if he had to wait for the completion of the job before he drew his pay.

Mr. Beaman contended, as accountants do, that nothing may be shown on the books but payments actually made. If interest on bonds were paid, then this interest could be entered without violence to correct accounting rules.

Mr. Hall also said that the depreciation might well be considered as starting from the completion of the job, for any depreciation of the material used in sinking a shaft would be charged by the contractor as part of the cost of sinking, and the timber in the shaft would inevitably be paid for by the operator as if it were newly installed. Of course the remaining life of the material incorporated in the shaft or merely used in the work of its construction would be less than if it had just been put in. If its economic life was 20 years, whatever had been in, say a year, would have to be depreciated not 5 per cent., but as if it would be valueless or have a junk value after 19 years.

Greer Submits System of Mining by Panels

G. E. Greer, of Morgantown, read a paper on "Projecting a Mine on the Panel System." The main criticism was that the long period and large cost needed for full development was prohibitive for a small capitalist or where the union demanded a big differential for narrow work. This argument was advanced by Joseph Virgin, mine superintendent of the Mound City Coal Co., Moundsville, W. Va.

Another critic advocated wing pillars twice as big as the 100-ft. pillars shown and also that the chain pillars be reduced to 15 ft. C. H. Tarleton and A. W. Hesse said that the Consolidation Coal Co., which had at one time favored a 25-ft. chain pillar, had recently tried 35-ft. pillars. In advancing the narrow pillar served every necessary end, but in retreat if there was a squeeze, a 25-ft. pillar could not be split and coal was almost inevitably lost. Mr. Tarleton was not prepared to say that the larger pillar would give satisfaction.

The report of the secretary showed the usual impecuniousness of mining institute funds. The cash on hand was $21.20; the debts were $102. So the balance was against the association to the extent of $80.80. The secretary reported that the bulletin was discontinued as it seemed to put too heavy a strain on the institute finances.

The election followed. W. H. Cunningham proposed that J. C. McKinley act during a second term as president, and he was elected unanimously. E. N. Zern proposed and lobbied for Karl Schoew as secretary-treasurer, but after a ballot he was induced to accept reëlection himself. The vice-presidents will be J. W. Bischoff, manager, Davis Colliery Co.; Josiah Keely, manager, Cabin Creek Consolidated Coal Co., Kayford, W. Va.; George Watson, vice-president, Consolidation Coal Co., Fairmont, W. Va.; Karl Schoew, consulting engineer, Huntington, W. Va.; J. R. Cameron, of the Goodman Manufacturing Co., Chicago, Ill. At the request of the burgess of Bluefield, W. Va., it was arranged that the next meeting would be held in that city.

On the second day, Dec. 9, J. W. Bischoff's paper entitled "Some Suggestions and Ideas Based on Observation" was read by the secretary, E. N. Zern. In the discussion of this paper it was urged that the shortage of labor might be met by greater efficiency. Unfortunately, too much of the waste of labor, according to the speaker, was owing to the fact that there was nothing in the mining contract to reward the operator for all he might do to make the mining and loading of coal move steadily and without friction.

Prompt supply of mine cars, timely cleaning up of coal shot down and undercutting on a regular schedule were necessary for the efficiency of the miners at their work, but as the operator had little interest in the productivity of the miners, it was hard to induce him to expend time and money to provide for the regular operation of cutters and loaders. A mingling of the time and day wage was urged as a solution, the time wage being a minimum payment. The output would then be paid for as at present, but at a lower rate.

It was suggested that a larger tonnage would be made per man if the older breast machines were replaced by shortwall cutters. But this would not be made general till the operator could feel assured of an income from the change. He could hardly be expected to scrap his old machines and buy new ones solely because the change would enable the miner and loader to earn a larger wage.

The speaker who urged this mingling of time and output wage met nothing but opposition. Josiah Keely said that if it were not for the probability that mules would be killed in the wild rush for tonnage, he would advise putting all the drivers on a tonnage basis, so as to give them an interest in their day's work. Joseph Virgin said he would like to see everybody on piece work, as output wages made supervision less necessary, while J. C. McKinley urged that even the mine foremen would do better if paid at least partly by a bonus, and he reported that he had been successful in introducing the bonus system for efficient mine foremen at his mines.

In opposition to what had been said he believed that it had been generally found that additional bosses would increase tonnage and so give a larger output to pass over one tipple and make operation generally more efficient than it would otherwise be.

Product of Breast and Shortwall Cutters

He declared that it was true that the miner gained much direct benefit from the replacement of the breast machine by the shortwall, which latter he estimated did 50 per cent. more work than the former.

C. H. Tarleton stated that the Consolidation Coal Co. in West Virginia was unable to show a difference of 50 per cent. between breast and shortwall machines, no matter who ran them. J. R. Cameron said that the output was often determined largely by custom and not by the capabilities of the machine.

Josiah Keely was surprised at Mr. Tarleton's statement, for he had found that the shortwall machine cut twice as much as the breast machine in an ordinary room. He really was surprised that the Consolidation Coal Co. could not get as favorable a result when cutting the Pittsburgh bed, which he regarded as not in any way harder than the splint bed in the Cabin Creek district.

G. A. Burrell then demonstrated his portable gas detector. It is really in the borderland between an indicator and an analyzer. It consists essentially of a U-tube partially filled with water, the end of one tube being provided with a rubber mouthpiece. The fireboss or inspector blows into that end, and as a result the other limb is filled with water. As soon as the operative ceases to blow into one limb, the water falls to a balancing position, causing a vacuum in the other. This vacuum is filled by the atmosphere of the mine.

In the limb thus filled with gas a platinum wire has been introduced. This is caused to glow for 2 min. by the electric current generated by two Eveready cells incorporated in the base of the instrument. This burns the methane in the mixture, causing a partial vacuum which the water rises to fill. The movement of the water thus caused is a measure of the gas burned. Of course the temperature is raised somewhat, and the apparatus must be shaken to reduce the mine air and combustion products in the graduated limb to the temperature of the water used.

Mr. Burrell, on being questioned, said that each cell cost about 6½c. and a pair would serve for over 20 determinations. The whole instrument made in quantities should not cost more than $5, and the platinum should serve for several hundred indications. The detector will measure methane down to 0.1 per cent., and the limb is graduated to 4 per cent. The upper range may be extended if the actual percentage of methane is not sought, the observer being only anxious to determine the presence of the gas in large quantity. Air containing 5½ to 14 per cent. of methane will explode and so show that methane is present in some unknown proportion. Above that percentage the methane will not burn. The explosion is not to be dreaded, as the violence is small and is cushioned by the water. A few fine drops of fluid are thrown out, and that is all the damage done.

In answer to an inquiry as to the means of ascertaining whether the combustion limb of the tube was completely filled prior to admitting the measured quantity of mine air, Mr. Burrell said that the operative should blow until he heard a click which evidenced that the limb of the tube was full. The instrument would give practically unaltered results if ethane constituted as much as 15 per cent. of the combustile gas admixture.

An Accurate Instrument for Untrained Men

The water must be maintained at a certain marked level, so that the graduated limb will contain 2 cu.in. of air when the water is at the same level in both limbs. There is not enough carbon dioxide dissolved to affect the result. The small quantity present makes such absorption negligible. Mr. Burrell claimed that the new detector could test eight samples in the time needed to make one Hesse test.

The sample having been taken by blowing and allowing the water to fall, the operative could cause the platinum to burn the gas while he was passing to another place. He could examine the instrument and take his record just before preparing to take another sample. However, J. Virgin contended that even under those operating conditions a mine would have to employ four firebosses where one is now engaged, if the requirement that examinations be made within three hours of the miners' entering their working places was to be strictly maintained.

Frank Haas, the consulting engineer of the Consolidation Coal Co., declared that he looked with much favor on the innovation. His company was using a method involving the taking of flasks into the mine and thus securing samples. The new method was far prompter and made it possible to ascertain present conditions rather than those existing some few hours before. He believed the method of great value in determining the character of the air in the return airways as far as combustible gas was concerned.

It was the custom of the Consolidation Coal Co. to estimate methane to 0.01 per cent., not because it was valuable to know how much combustible gas was present to such a degree of nicety, but because it was important to find whether the degree of methanization was increasing or decreasing. The company does not tolerate more than 0.25 per cent. of combustible gas in any of the return airways of its mines.

Someone made the statement that ½ per cent. of "gas" could be detected by the Wolf lamp. J. L. Ryan declared is was possible, but not practical. When there is over 1 per cent. of gas present, the trained observer can guess the quantity within ¼ per cent., but there are a great number of men who will be oblivious to the presence of gas in the lamp till 3 per cent. is reached.

G. S. Brackett's paper on "Day Labor in Bituminous Mines" followed, but failed to draw discussion because such a mass of figures can be analyzed and appreciated only in the privacy of the study.

Mine Depletion and Depreciation Estimates

J. B. Hanford rose to vindicate the methods of his company, the Elkins Coal and Coke Co. He certainly could not allow his company to be associated in a group with those which kept such poor records of expense that the cost could not be determined within 25c. or 50c. per ton, as stated by I. C. White of many unnamed companies in his statement of the previous day.

Punctilious though the record of the Elkins Coal and Coke Co. is, the depletion and depreciation is only figured annually and not monthly, as J. C. McKinley advocated. It is not well to run for a whole year and then repent at leisure when a report exhibiting all the cost entailed is for the first time presented.

The discussion drifted naturally to the percentages allowable for depreciation. C. H. Tarleton declared that copper was by no means of such long life as was generally thought. For while it did not lose by friction or oxidation, its occasional contacts with coal, roof and floor caused short-circuits resulting in its depreciation and depletion in weight, and it soon hardened till it became too brittle for use.

He considered it an open question whether light rail and all copper should be credited to equipment or charged direct to operative expense. Rail in wet places suffered rapid oxidation, and both C. H. Tarleton and J. B. Hanford urged that regarding rail as one of the direct operating charges prevented the foremen from wasteful requisitioning and lack of care of the material furnished.

Mr. Hanford said there was a large loss from cutting rail to pieces and from bending. Much loss from crystallizing also results. Much rail that is giving excellent service in a wet place will prove utterly unfit when lifted and spiked onto other ties. It was also said that many of the rerolled rails prove to have a rapid deterioration. The ball of the rail falls, and the web turns down. It was urged that billet rails be kept separate from those rerolled, for they alone are suited to switch work.

E. B. Day recalled the opinion delivered at a previous meeting that some cutting machines depreciated about 25 per cent. in the first year, but less could be deducted for this cause in succeeding years.

It was decided to hold the meeting next winter in Huntington, W. Va., and to invite the Kentucky Mining Institute to participate. At the closing of the morning's business several visited the Consolidated Coal Co.'s laboratory in the basement of the assembly building.

The afternoon session comprised an address on "Welfare Engineering as Applied to Coal Mines" by W. F. Hyde, of Wheeling, W. Va., and "Needed Reforms in the Coal Mining Industry" by K. F. Schoew, a consulting engineer of Huntington, W. Va.

At the evening session, over which J. C. McKinley also presided, Governor H. D. Hatfield was the principal speaker. Judge W. S. Haymond, of Fairmont, made the opening speech. The Governor flayed the operators for attacks on his administration and defended himself against the charge of being disloyal to the coal industry of his state. At the conclusion of the speech the Governor, probably because he was Governor, received much applause. Those who heard the speech of Governor Brumbaugh of Pennsylvania before the National Safety Council in Philadelphia would naturally contrast that humanitarian appeal with the exasperating remarks of the West Virginia Governor. It would be better for Governor Hatfield and his state if he would seek to lead and not try to drive. J. C. McKinley, the president of the institute, closed with a paper which did him and the institute much credit.

⁂

Mine-Car Resistance

By E. B. Wilson*

It is customary for engineers to reckon 20 lb. per ton as the resistance offered to mine cars on a good track. My notes show that this is insufficient, as there are a number of items having a bearing on the subject.

A. M. Wellington found that it required 5 lb. per ton to pull a loaded freight car and 7 lb. per ton to pull an empty freight car over a level railroad track at 10 mi. per hr.

R. Van A. Norris made 980 tests some years ago, which gave a resistance of 26 lb. per ton for 20 loaded mine cars and 42 lb. per ton for 20 empty mine cars of the same size over the same track, traveling 4½ mi. per hr. One reason for the wide difference between the two sets of experiments mentioned is found in the size of the car wheels.

The freight cars had 32-in. diameter wheels, while the mine cars had 16-in. diameter wheels, thus making it possible for the former to ride over the inequalities in the roadbed with more ease than the latter.

Mr. Norris's experiments brought out another important matter not usually mentioned in haulage articles; namely, that it requires more power per ton to haul short trains of mine cars than longer ones. This is of added importance to those mines which have adopted the two-unit locomotive in order to pull heavier loads.

One factor that probably reduces the ton resistance in longer trips is that the forward cars clean the track; and another is that the greater momentum of longer trips aids in keeping the cars moving.

Professor Baker made some experiments on clean and dirty tracks, the results of which briefly were as follows: On a perfectly clean track the resistance was 19 lb. per ton; on the same track with ⅛ in. of fine dust the resistance was 28 lb. per ton; while with ⅛ in. of powdered stone the resistance was 40 lb. per ton. This should comfort superintendents in the soft-coal mines who begrudge spending money on road cleaning, because when they clean the haulage entries, they not only lessen the dangers from explosions, but decrease the cost of haulage.

It is also a lesson for some anthracite superintendents, for fine anthracite is nearly equal to sand in offering resistance to traction effort.

Labor Problems at Coal Mines*

By J. W. Bischoff†

SYNOPSIS—The labor problem is of leading importance, and many a plant at great expense solves every difficulty but this and fails to be efficient because it works perpetually at half-force.

The most acute problems in the production of coal today are the scarcity of railroad cars and the lack of efficient labor. Fortunate indeed is he who is well supplied with both.

As mining men we are not directly responsible for the lack of railroad equipment, and we are in no position to remedy our difficulties. Nor are we able to correct the labor shortage except by inducing men to come to our mines from the plants of our competitors. There are few among us who fail to look at that question from a personal or selfish standpoint and who would not welcome an increase in their working forces, even though the men acquired were secured by someone's loss.

Scarcity of cars and labor, distributed equitably, impose a loss on no one; the final results, measured by dollars and cents, are the same. He who has plenty of both during times like the present is the envied one among the brethren.

Conscientious scruples are forgotten if by hook or crook the daily allotment of cars can be increased; also if the superintendent, foreman or some boarding boss can get some of the other fellow's men. In other words there is not even a gentlemen's agreement that would be violated in thought or deed if we see an opportunity to take advantage of our fellow man's shortcomings.

Labor Problem Given Minimum Consideration

During even ordinary periods of prosperity, with nothing extraordinary affecting the supply of available labor, the problem of a reasonable supply of this valuable commodity is the hardest that many of us have to solve. Inconsistent as the following may sound, it is the one problem given the least earnest, painstaking and intelligent thought.

Expenditures for machinery and for mining, transporting and preparing the coal for market are freely made by the owners, but the securing of that labor necessary to get the most efficiency from the equipment is, if given any thought at all, delegated to the local officials or left to the whims of chance or fate. We are prone to look upon it in much the same light as did the farmer who in answer to a friend's expressions of sympathy after a season of poor crops said: "Well, I have no reason to complain. Thank God, none of my neighbors have any better crops than I have."

Most of us have no doubt seen operations planned, developed and equipped for a production which was never reached by more than half owing to the lack of sufficient men. The loss in interest on investment alone is considerable, to say nothing of the profits (when there are such) on the additional output that should have been secured.

The newcomer in an already operating field, where the conditions and regulations of work are not fixed by the operator at his pleasure, learns the rate of wages paid and the house rents and store prices charged and follows scrupulously the practice of the district. He hopes when he is ready to mine that he will get an adequate supply of men; but he secures only those who are always on the outlook for a new operation. He has no reason to expect that enough men will leave other mines to enable him to operate at a reasonable profit.

As I said before, the labor-supply question is the one given the least earnest, painstaking and intelligent thought. We all know, some by hearsay and some by experience, that men may be secured by paying the transportation charges. I do not believe we now so frequently advance such charges in West Virginia as in the past. Under favorable conditions it works well. But as communities become more thickly settled, communication is much easier and more frequent, and if one alone indulges in the practice, his neighbors will benefit as much or more than he does. But with all its drawbacks the practice of paying railroad fare to needed mine employees is even yet resorted to.

Sociological Work without the Social Sense

Of late years we see and hear a great deal of sociological movements and moral uplift, which take the form of first-aid teams and meets, amusement halls, moving-picture shows, Y. M. C. A. movements, visiting nurses and domestic science teachers, more sanitary conditions about the camps, better houses, etc., all of which are good.

It shows that we have awakened to the realization that we are dealing with and have under our control something—a living and breathing being capable of thinking and acting—which we indirectly acknowledge we are dependent upon and whose place in the fixed order of things is invaluable; that it is profitable to keep him with us, and the better satisfied he is while he is with us the more profitable he is. This sounds mercenary. It is. But in the natural order of things, the interests of the two are so closely allied that one cannot truly prosper without the other doing likewise.

I do not mean to criticize adversely any of the welfare movements before mentioned, but I will venture the statement that they are more or less superficial, and unless conducted with judgment and knowledge of human nature as it presents itself in those we desire to influence, they are likely to be of little or no lasting benefit. As an example the following case occurs to me: Arrangements had been all but completed to install a visiting nurse and settlement worker in a certain mining town, but for some reason unknown to me it was abandoned.

Now these were a few of the actual conditions existent in that town: It was isolated. No passenger train service approached nearer than two miles. There was no means of ingress or egress except by walking, not even a wagon road. The houses were all built on a hillside, and no garden patches were available. Moreover, there were no fences around the individual houses. Livestock of all descriptions roamed at will. No coalhouses were provided, and the coal was unloaded on the ground, both in summer and winter. This was the custom when the team had time to deliver coal; otherwise the tenant carried his own fuel. The surface closets had received no attention for years, and there were many other faults in that mining village which I have not mentioned.

---

*A paper entitled "Some Suggestions and Ideas Based on Observation," read Dec. 2 at Fairmont, W. Va., before the West Virginia Coal Mining Institute.

†General superintendent, Davis Colliery Co., Elkins, W. Va.

These conditions no doubt are extreme, but they are cited only as examples to show how mistaken we can sometimes be in our misguided efforts to uplift. I might add that I happen to know that the project of uplift was not abandoned because the conditions in the village were so unfavorable.

Should Miners Secure Homes of Their Own?

The weight of opinion seems to be against the miner owning his own home, but a casual investigation of conditions where such purchases have been made to some extent should furnish sufficient proof that within certain limits and under certain conditions the miner's ownership of a house and lot is beneficial to both miner and operator. It cannot always be advantageously arranged on account of unfavorable natural conditions, the uncertain or certain short life of the mine and other difficulties that could be mentioned, but cases are numerous where it could be applied, and on the whole I am inclined to favor it. Any man, though there are sufficient exceptions to prove the rule, who is ambitious enough to want to own his home will make a better citizen and workman. He is likely to be steadier, more conservative, reasonable and amenable to discipline.

And then the question arises as to the desirability of the company store as I prefer to name it. I do not like to hear it called the "commissary." That term is appropriate when applied to the store rooms of construction camps of railroads and reasonable enough when applied to the stores installed to take care of workmen engaged on some temporary job, but the use of the word in a mine village reflects on the stability of the industry.

The treatment, in every sense of the word, accorded the miner and his family in their dealings with the store can have as much or more influence upon the miner for good or evil than his relation with the superintendent or foreman. This fact is too often overlooked. In many cases the responsible head of the mercantile department reports to someone higher up who is not in touch with actual everyday conditions around the mines. Thus in his effort to show his part of the business to the best advantage he creates friction and discord for the local managers and superintendents. I have known more dissatisfaction to be caused by a real or fancied wrong at the hands of some unthinking clerk than the foreman would cause in months.

Fortunate indeed are those who are never troubled with labor shortage. The others may take a lesson from their more favored neighbors. There are numbers of mining communities that are able to command a steady supply of labor. Study them, learn from them and profit from the mistakes of him who is satisfied to stay in the same old rut.

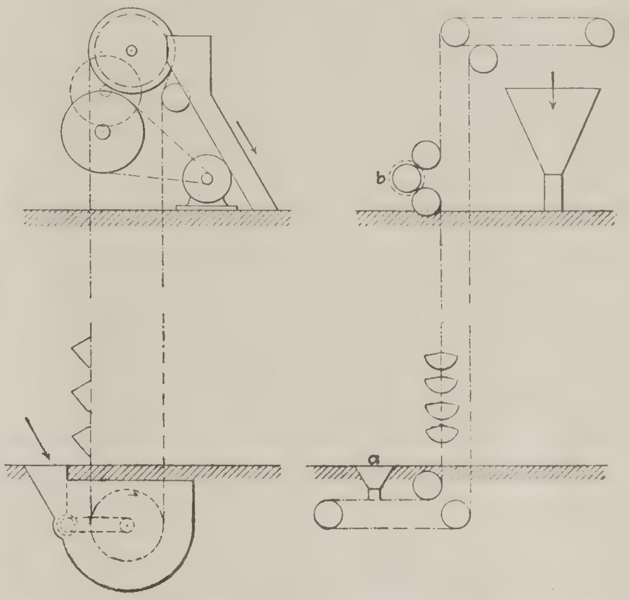
There is a fixed amount of labor, and he who gets more than his quota will be the one who will reap the biggest harvest. I have not intended to introduce sentiment, humanitarianism or paternalism into this discussion, for to me this care of the miner's interest appears to be a simple business proposition.

The Conveyor as a Shaft Hoist

The ordinary shaft hoist has certain inherent objections, such as weight and inertia of intermittently moving, imperfectly balanced parts and loss of time through the reverse motion. These obvious disadvantages increase with the depth. They may be largely overcome by a hoist on the belt-conveyor principle, and although the latter introduces many new difficulties of its own, it is interesting to see how far these can be overcome and whether there is an economic field, at least a limited one, for the continuous elevator in vertical shafts.

Attempts in this direction have been made in Germany, for example, with some success in shallow mines. The various systems are discussed in a noteworthy article in "Glückauf," by Dipl.-Ing. F. Wintermeyer, of Berlin.

Two of the oldest German installations are at the Emma mine of the Consol. Sudersche Lignite Co., Helmstedt, and the Karoline mine of the Germania Co., at Gorma, near Rositz. These were made by the Machinenfabrik Buckau and the hoisting depths are 170 and 128 ft. respectively.



FIGS. 1 AND 2. TWO ARRANGEMENTS OF BUCKET ELEVATORS AS SHAFT HOISTS

Fig. 1 is a diagram showing the principle of these hoists, without entering into details. The one at the Karoline mine is driven by a 25-hp. motor and with a chain speed of 2 ft. per sec. the delivery is 70 tons per hour.

An improved type of elevator has pivoted or swinging buckets, as shown in Fig. 2. Here one of the filling hoppers is marked *a*. At the Johanne Henriette lignite mine, near Unseberg, is a swinging-bucket hoist made by the Buckau works for a depth of 262 ft. Shaft guides are provided for the chain. Two men suffice to attend to the hoisting.

A design of continuous hoist intended to be applicable to greater depths is David Davy's English system, dating from 1901. It was proposed to lift cars as usual on cages, which were to be hooked to a constantly moving chain and removed from it at the landing. Intermediate sheaves are provided to relieve the weight on the upper one. The system of Cséti v. Verbó differs from Davy's in discarding the use of car cages and hooking the car bodies to the chain as buckets. At the top of the shafts these are dumped without detaching.

Schwidthal has devised a system of motor-driven intermediate sheaves. Unlike Davy's method, they are used primarily with fixed buckets.

Some work diagrams for different hoisting systems will show the power consumption at different points of the operation. Fig. 3 is for a rope hoist with drum and tail rope. Fig. 4 corresponds to a hoist with driving sheave and tail rope. Fig. 5 is for one with drum but without tail rope. Fig. 6 is a diagram for a continuous hoist, that shows not only a greater uniformity but a saving in power.

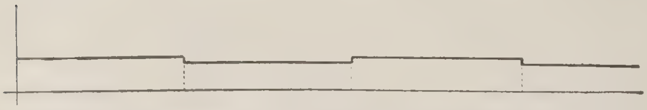


FIG. 3. DIAGRAM OF POWER CONSUMPTION OF A CONTINUOUS SHAFT HOIST

In conclusion it appears that the use of continuous hoists for shallow mines has reached a practical stage while for deep shafts they are more experimental.

Pages from a Miner's Notebook; the "White Collar" Job

It may be pride; it may be only the practical demonstration of the laws of evolution, of advancing the child to a position in life superior to that of the parent; but whatever it is, there is something pathetic to me in the boast of many an old miner who undoubtedly entered the mines at the age his son is now in the last grades of the camp school that "my boy shall never go into the mines."

Yet it is only natural. The father has known nothing but hard, back-breaking toil since his early boyhood, and even though pathetic it is a supreme example of parent love, a manifestation of fatherly care and pride, this desire of the men of the mines that their sons shall have "white collar" jobs.

Still, it is a mistake. There must be miners, and how better, as a class, could miners be improved than by the adaptable, common-school educated American boy following in the trade of his Scotch or English father, learning from this best of workmen the workmanship of the mines and adding to this lesson the natural desire of the American boy to improve on old methods.

The eldest son of an old Welshman arrived in camp last night to "visit" his parents. He is something in the city—physician, lawyer or stenographer—what, nobody seems to exactly know. Whatever it is, he has not made such a mark as to have his fame on every tongue.

His parents were overjoyed to see him, yet his indifference was apparent to all but those same parents. They proudly walked with him up and down the main street of the camp; to the store for their weekly paper, where the son stood about awkwardly, self-conscious under the scrutiny directed to his flashy clothes.

They sat on their front porch until a late hour, yet there was no sympathetic talk between them. The mother asked questions which were answered perfunctorily. A younger sister played upon the piano, the only luxury the old folks possessed except the son, but her music elicited no complimentary response from the guest. The evening was a trying one for all concerned.

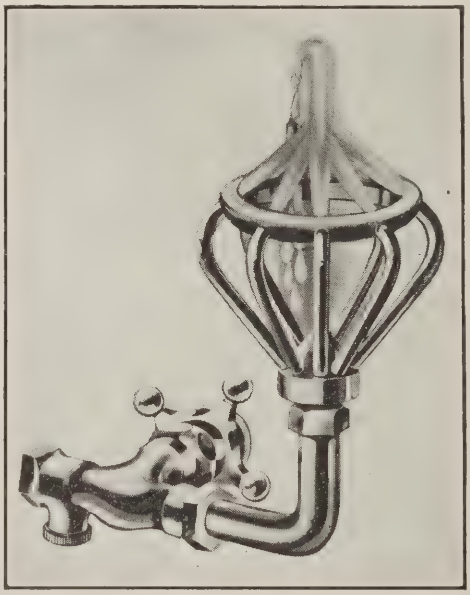
He left for the city this morning after his father had drawn heavily on the scanty savings laid by at the company store, and the old mother, with a puzzled look in her eyes, confided to my wife that there was "somewhat of a difference in her John."

And what a world of pathos there was in that "somewhat of a difference in John"! John would have made a good miner. His earnings, while he remained single, would have added much of comfort to the old age of those self-sacrificing parents; yet that fatherly pride and the carrying out of the boast that "my boy shall never go into the mines" had made him a mediocre physician, or lawyer, or stenographer, or whatever he was; had given him a "white collar" job while his old father supplied the cash to keep the white collar laundered.

Sanitary Drinking Fountain

In its broadest sense the safety movement so prevalent at the present time, and which has for its avowed object the preservation of human life and limb, should also include the preservation of health as well. Conditions that foster or aid the propagation of germs or the spread of contagion should be treated as carefully and as thoroughly as should a dangerous piece of machinery or a section of loose roof.

When many mining companies some time ago discarded the water barrel and dipper for the bubbling drinking fountain in shops, power plants and tipples and even underground, a long step was made in the right direction. Investigation by the Federal health authorities has shown that one person out of every 47 has unmistakable signs of contagion. Any public drinking device that permits a person's lips to touch a metallic surface is not sanitary.



FOUNTAIN WITHOUT BOWL IN OPERATION

As a further sanitary improvement the H. W. Johns-Manville Co. has placed upon the market its J-M Sanitor fountain head. As may be seen in the accompanying illustration, this consists of an annular nozzle from which eight small convergent streams of water are emitted. These meet in midair and form one vertical drinking stream. It is impossible for a person using one of these fountains to touch or otherwise defile with his lips any of the metal parts, except by premeditated and malicious intention.

Projection of a Panel Mine*

By Guy E. Greer†

SYNOPSIS—A properly designed panel system provides a large tonnage from a small working area, largely prevents squeezes and localizes them if they occur and provides an ideal ventilating system.

This paper is based on a projected system of panel working, the tract of coal consisting of 991 acres, presumed for convenience to lie in Braxton County, West Virginia. The projected work is presented mainly for the purpose of inviting discussion on the merits of the panel system as applied to the Pittsburgh seam of coal.

On paper this system, with the rooms advancing and the pillars retreating, has almost everything in its favor, as opposed to the hit-or-miss principle of driving rooms and entries. The advantages may be briefly summarized as follows: Better control of the ventilation can be secured, and from the fact that each panel is practically surrounded by airways, the ventilation can be altered to suit almost any possible condition; the gases and powder smoke from each panel are carried directly into the return airway and are not circulated through other parts of the mine; fires or explosions are more likely to be confined to the panel in which they occur; squeezes are in a great measure eliminated, and if they do occur, they are more easily handled because they are confined to one panel; the output of coal may be better regulated, and the work concentrated so that the organization is more efficient.

Inasmuch as the method of operation discussed implies working the ribs as soon as the rooms are driven to their limit, it follows that cleaner coal will be obtained; also, since the roof is not permitted to stand for a great length of time, the expense of timbering is reduced.

Only One Roof Break Needed in Each Panel

The advantage of the panel system is most apparent in the extraction of the coal. Each panel, as shown in the drawing, has 6 butt headings. The method of working specifies that the upper 10 rooms on No. 1 butt (see panel A) are to be worked first. When these are driven up, pillar work is ready to be started. At the same time the lower 10 rooms on No. 1 butt and the upper 10 on No. 2 butt are started. When the break line, gradually retreating, reaches the entry, the lower rooms on No. 1 butt and the upper rooms on No. 2 butt are ready to fall into line. The advantage of this plan of working lies in the fact that only one initial break of the sandstone need be made for each panel. It is this initial break that is often the dangerous and expensive feature of drawing ribs.

If the break does not occur within a reasonable time, the extra pressure on the diminishing ribs will crush the coal, the roof will become treacherous and the bottom will be likely to heave. This danger period is met once and for all in each panel after the break line is started. If a squeeze should result, all room work may be suspended, the squeeze may be localized and the proper measures taken to rectify the conditions, whereas in that system where all the rooms are driven up before any pillar work is started, a squeeze is far more difficult to control and cannot be prevented from spreading.

In a room-and-pillar system where a haphazard method of driving entries and rooms is followed, the men are scattered widely over the mine. This complicates the haulage problem and reduces the number of wagons which a driver or motorman can handle. Adequate supervision is also rendered difficult and expensive, and the tendency will be to slight this important part of the organization. This will inevitably result in waste of material, inefficiency of day labor and a small output for each miner. It is also a most prolific source of accidents and would be likely to promote dissatisfaction among the men.

Estimates 500 Tons and 40 Rooms to a Panel

In the panel system, however, the work may be concentrated, so that a large output may be secured from a relatively small part of the mine. After the first 20 rooms have been driven up and the break line is well started, 40 working places will be available in one panel. Assuming two men to a working place, if each mines four wagons of two tons each per day, an output of 640 tons may be secured from one panel.

Allowing for contingencies of all sorts, it will be safe to assume an output under normal working conditions of 500 tons per day for each panel. Thus the daily output of the mine may be made 1,500 tons by working three panels. In the meantime of course the entry driving is being carried ahead, so that the output will probably be more.

Practically the only disadvantage of the panel system is the fact that since entry driving may be slow some time must elapse after the opening of a mine before a large output may be obtained. This is a disadvantage that often prevents this system from being used. It is always desirable when starting a new mine to show a large output as early as possible. This has been provided for in the projected workings shown in the illustration. Sections 1 and 2 are purposely left free for "hogging" in order to secure quick development. These sections are near the opening and may be worked soon after the main entries are started.

From all the evidence obtainable the dip of the Pittsburgh seam in the section under consideration is slight and openings to the outcrop are easily made.

Specifications for Working the Coal Area

The main entries are to be six in number and driven on the butt. Entry A and the main right entries are to be four in number until panel C is reached. All the other headings should be on the two-entry system.

Ventilation is to be by exhaust, making intakes of all haulageways. In all cases half the entries are to be taken as intakes and half as returns. The returns are to be on the outside where there are more than two entries. Each panel is to have one split of air. A suggestion as to the ventilation is shown in the plan in panel C.

---

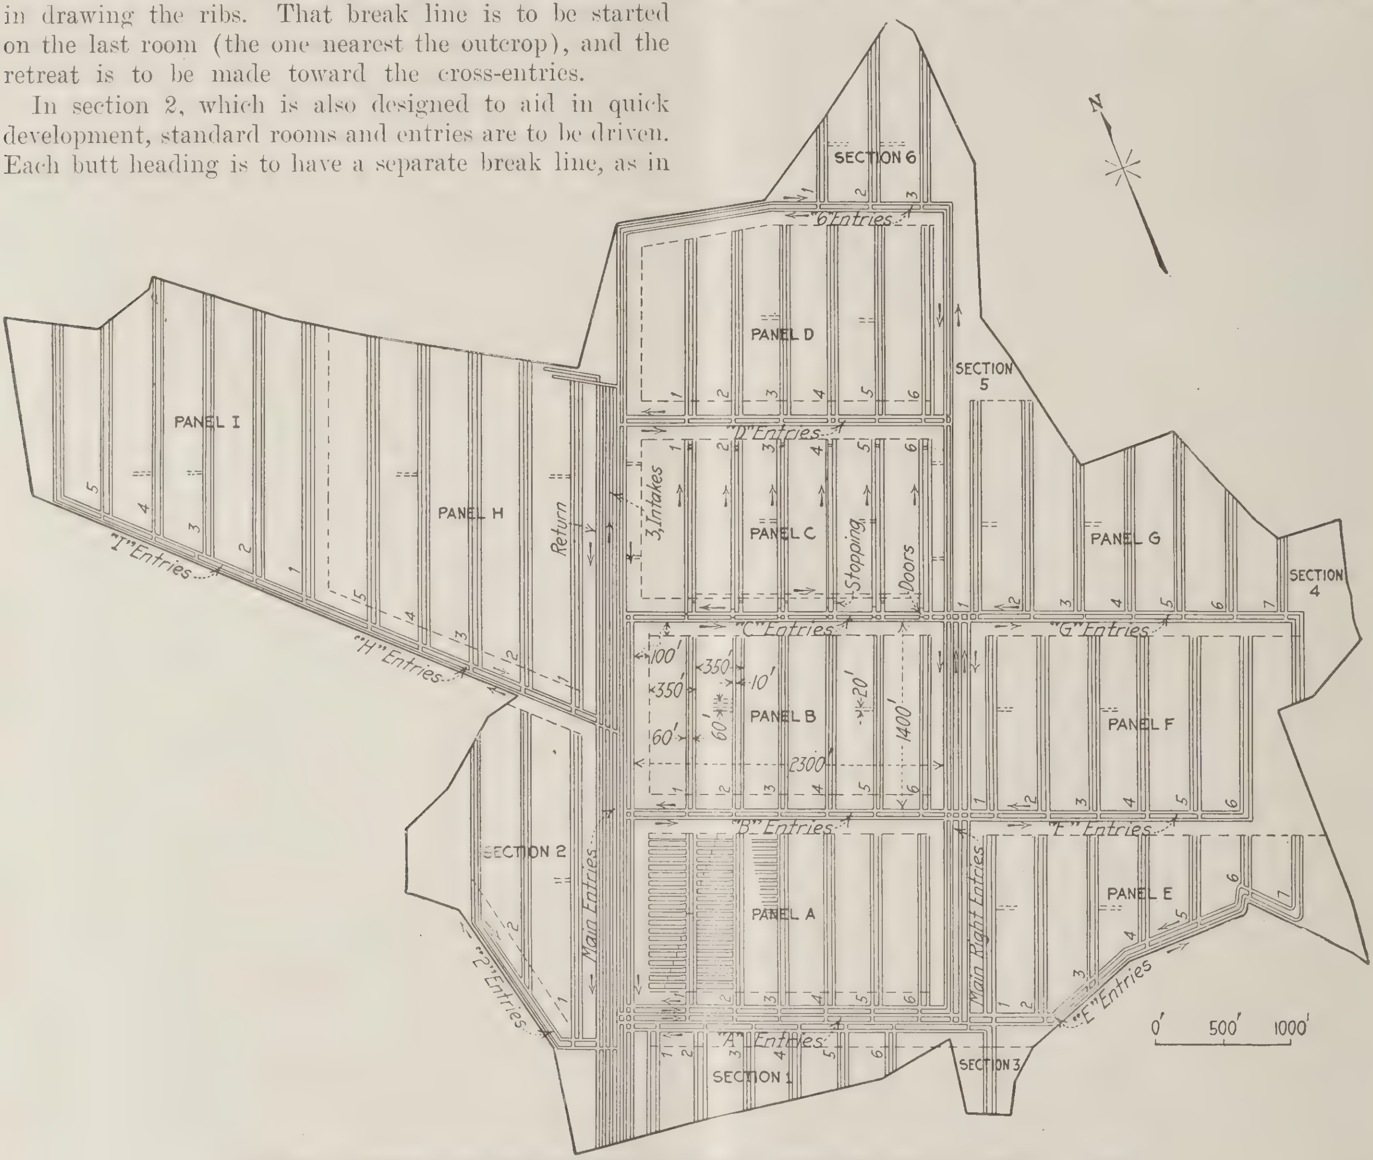
*Paper entitled "Projecting a Mine on the Panel System," read before the West Virginia Coal Mining Institute, at Fairmont, W. Va., on Wednesday, Dec. 8, in the Watson Building.

†Morgantown, W. Va.

All entries are to be driven on 60-ft. centers, with 10-ft. passageways and 50-ft. ribs. All rooms are to be spaced on 60-ft. centers, to be 20 ft. wide and to have 40-ft. pillars, but this rule is not of force for working out boundaries of irregular sections.

In section 1, which is for quick development, the rooms and entries are to be standard, except that the former may be turned to follow the boundary lines after the butts are driven up. In order to secure a quick output each butt heading is to have a separate break line in drawing the ribs. That break line is to be started on the last room (the one nearest the outcrop), and the retreat is to be made toward the cross-entries.

In section 2, which is also designed to aid in quick development, standard rooms and entries are to be driven. Each butt heading is to have a separate break line, as in section 1. Entry barrier pillars are to be withdrawn after working out the last ribs of the section.



A PANEL SYSTEM FOR PROVIDING A LARGE TONNAGE FROM A SMALL AREA

In section 3, standard rooms and entries are to be driven, the former being opened from both the entry and aircourse.

In section 4, standard rooms are to be driven from G, No. 7 aircourse, and from the butt heading, which is driven south from G, as shown in the drawing.

Section 5 is to be worked in connection with the removal of the main-right-entry barrier pillars. Standard rooms are to be driven from the main-right haulage.

Section 6 is to be worked on the retreat after panel D is worked out. Standard rooms are to be driven and the break line started after the completion of the last room of No. 3 butt.

Panel A is to be worked on the advance. Standard rooms are to be driven and a break line started upon the completion of the last room in No. 1 butt, as shown in the drawing. Panels B, C and D are to be worked on the advance as panel A, while panel E is to be worked on the retreat. Standard rooms are to be driven and a break line started upon the completion of the last room in No. 7 butt. All barrier pillars are to be withdrawn.

Panels F and G are to be worked on the retreat just as panel E. All barriers are to be withdrawn after the ribs are extracted in section 4. Panel H will be worked on the retreat. Standard rooms will be driven and a break line started upon completion of the last room in No. 5 butt. If necessary or desirable for quick development, entries may be driven along the outcrop on the north side of this panel. Barrier pillars are to be retained.

Panel I is to be worked on the retreat, as panel H. All barrier pillars are to be withdrawn, including those between panels H and I and the entry barriers of panel H.

All the remaining barrier pillars are to be withdrawn after all panels and sections are completed, taking in succession the main right, D, C, B and A and main entries on the retreat.

Continuous Face Haulage

By J. F. K. Brown*

SYNOPSIS—A system of rope haulage is here described that is continuous, handles about 600 tons per day and may be easily advanced as the workings progress.

The expression "face haulage" would indicate a means of disposing of the coal output from the working face by a haulage system so flexible as to be capable of rapid extensions. The system described hereafter as conforming to these particulars and which has been used as a means of transportation at the face for many years has the following special points of interest:

(1) The tonnage handled is large, 600 tons per day. (2) The system is of the endless-rope type, the empty cars entering the section at one end and the full ones leaving at the other. (3) Cars can be taken off at any point along the rope, and full ones attached. (4) This system has been used in both room-and-pillar and longwall mining. (5) The haulage can be operated around corners of a right angle and less at a radius of 3 ft. (6) The cars will leave the rope automatically at any point selected.

As originally developed the system was designed for pillar-and-room working and was only afterward adapted to longwall. The first factor to be noted is that this system, like the operation of coal cutters, has to have the operating section laid out to suit the haulage, and no success need be anticipated if the attempt should be made to transplant this haulage method into just any section, anyhow. Fig. 1 shows a typical section and the one in which the system was partly developed. The great regularity and evidences of design in the laying out and working of rooms and pillars are the principal points of interest. To lay out and keep up to the mark in operating such a working section should be neither an effort nor an extra cost to the engineering staff of any coal mine.

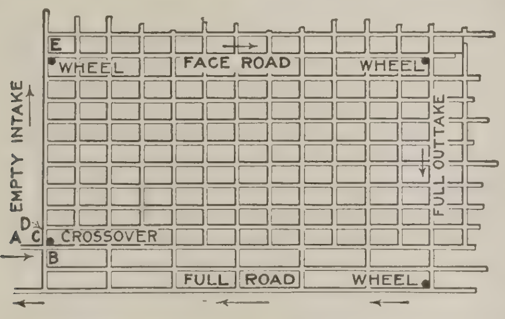


FIG. 1. GENERAL LAYOUT OF THE HAULAGE SYSTEM

It Paid To Plan Carefully

From experience in the particular mine described it was found that it paid well to have and to maintain this regularity. There was the direct benefit in cheaper haulage, ventilation was much simpler, break was more regular and dependable in working back the roof, the same roads in working back could be used again as haulage roads, turns, points and crossings were all standardized and rail lengths were always maintained the same, thus making less cost in the blacksmith shop.

Rooms were maintained at a width of 12 ft. and pillars 60x40 ft., the position of the room being laid off by measurement, and the alignment kept by roof lines. Every third road was held as a haulage road, hence the distance which the miner had to tram his coal never exceeded 140 ft., and as all the roads went through together and in line, there was never any delay in adding to the rope and transferring the haul to the new road. This change was usually accomplished during the night, a spare set of wheels being kept at hand and built in, in readiness for the removal.

From the illustration it will be seen that the various roads are referred to as the empty intake, the face road, the full outtake and the full road; the full outtake and the face road are the ones on which coal is attached to the rope. The haulage is a side-rope system with the rope on the side of the cars farthest away from the working places, while the turns are always to the right in the direction that the rope is running. It is only on a turn of this type that the rope can remain constantly attached to the car, as at any turn in the opposite direction the car has to leave the rope itself and be reattached by hand at some point round the corner. In Fig. 1, such a turn is shown at *B* and is known as a cross-over turn. Cross-over turns are to be avoided, if possible, since they require an attendant.

Locating the Turn Outs

In operation the rope with its complement of cars attached at regular intervals enters the section at *A*, Fig. 1, and travels round the cross-over turn at *B* and round the turn at *E*. From this point right across the section in every second or third road "turn outs" are laid, that is, points and crossings whose directions of approach to the main tracks are the same as is the direction of the cars on the main road. Sometimes these "turn outs" are connected with "back lyes," parallel roads to the main track, which are used as sidings for storage of pit wagons.

At first it was left to the miners themselves to tram their cars to the road and attach them to the rope, taking off an equivalent number of empties. Through time, however, it was found that this sometimes led to unequal distribution of the cars available and that the men at the beginning of the section managed to get their day's work finished much in advance of the men at the outward end.

As a result six boys were taken on, known as "drawers," whose duty it was to see that a proper distribution of cars was made at each turn out and to see that the last man in the section was fairly treated in the matter of getting pit wagons for his coal. These six lads did all the taking off and hanging on of the cars, and it was after their commencing work that the storage tracks were built in order to allow provision of enough cars to keep the men going while the drawers were at the other end of the section. At *E*, Fig. 1, the rope turned into the full road and so ran without further attention to a point where the cars automatically left the rope and ran to a collection point for an outside haulage. Four face haulages of this type landed their loads at this one point.

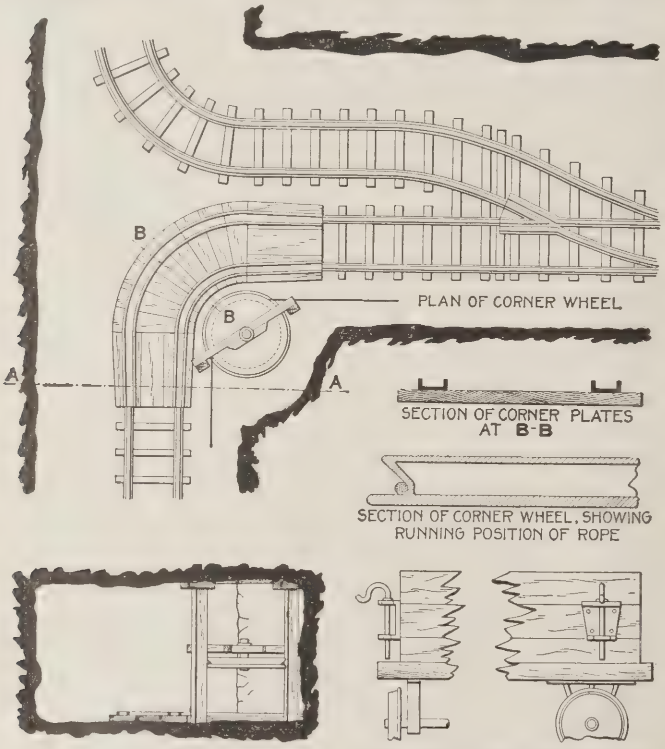
---

*247 Esplanade, Sydney, Nova Scotia.

The cars are regularly spaced when being attached to the rope at an average distance indicated by a hammer bell. Too close spacing results in wrecks wherever there is a hollow in the road. This is because the tightness of the rope causes it to lift out of the holder, thus leaving the car on the road for the next oncoming one to strike, and perhaps butt off the track. Spacing too far apart has the same effect, except that the accident then results in the weight of the rope upending the empty car; but a long length of empty rope can be run around the section provided several cars are dispatched together and not a single one at a time. The better plan when the supply of empty cars for the rope gets slack is to insist on regularly stopping the haulage until the cars needed are available.

Attaching the Rope to the Car

The rope is attached to the car by the jigger and holder shown in the drawing, and the height from the floor to the rope when in the jigger is 21 in. As the jigger is free to turn in the holder, there is some lateral play between the rope and the box, and this causes a greater grip to be exerted automatically between the rope and jigger at places where it would be most needed, such as a pull uphill. Detaching is attained by suddenly lowering the rail level a few feet in front of a pulley to which the rope is at the same time being raised.



PLAN OF CORNER WHEEL

SECTION OF CORNER WHEEL, SHOWING RUNNING POSITION OF ROPE

SECTION A-A

ROPE JIGGER AND JIGGER HOLDER

DETAILS OF ENDLESS ROPE HAULAGE

FIG. 2. SOME DETAILS OF THE HAULAGE SYSTEM

Usually the cars are being drawn up to this point, and the mouth of the jigger is ahead of the car box, but at the point where the level changes the cars run forward, bringing the jigger square and into a position at which the rope is more easily detached. It can then lift itself clear. In some cases where the jigger has become worn and sticks to the rope, it is simply lifted clear of the holder entirely and, running with the rope, comes against a heavy wooden cleat, in this way being knocked off the rope before the latter goes round the pulley. In detaching the cars in the workings all that is necessary is simply to lift the rope out of the jigger and quickly drop it to the side.

The passing of the cars round the acute turns is managed by the aid of the corner plates and the turn wheel, as illustrated. The jigger runs on the rim of the wheel and drags the car round in the channels; these narrow up at the end so as to guide the wheels onto the rails. Care has to be taken that the wheel is properly set and the correct height above the rail level maintained. The wheel should run parallel with both tracks, and the take-off of the rope should be easy. The haulage tracks require to be well laid to the roof lines, and of course to proper gage; while at the turns, the turn plates and rails should be well stayed.

The following particulars of a typical installation will be interesting:

Number of miners in section	98
Number of tons per man	6
Number of men per place	2
Cars per day	860
Tons per day	600
Weight per car	14 to 13 cwt.
Tare of car	4½ cwt.
Size of car	4x2x3 ft.
Rails handled in 12-ft. lengths	weight 24 lb. per yd.
Gage of road	24 in.
Rope, plow-steel	weight ¾ lb. per ft. and 2½ in. in circumference
Height of coal	72 in.
Nature of roof	Good, sandstone

Nature of section, flat, little water, good roof and floor, coal easily mined, roof weight helping considerably.

Grade, practically horizontal, about ½%.

Labor in Section	Wages per Day
Deputy, at $3, for one-third time	$1.00
Haulage man, at $2.50	2.50
Six drawers, at $1.75	10.50
Two roadmen, at $2, for one-half time	2.00
One boy, at $1.50	1.50
One night roadman, at $2	2.00
Shifting and haulage cost, about $210 a month, per day	3.50
Total	$23.00

Of these only part time of the roadmen and very little (about one-third) of the deputy's time are charged against the haulage, which gives a cost on the tonnage named of 3.83c. per ton. The distance traveled is 2.08 mi., which works out at a rate of 1.84c. per ton mile, which for a face haulage compares most favorably with the largest and most permanent of endless-rope haulages.

Rolls in the Floor Are Serious Obstacles

This system has its drawbacks of course, and the main one is on account of rolls in the floor. There is no difficulty in this provided the rolls encountered are long and not so sharp as to cause abrupt changes in the relative height from the floor to the rope, but should this occur, the rope does not get the chance to adjust itself to the ups and downs of the strata. As a general rule the more coal it is desired to handle the flatter the seam must be since the cars must be run closer.

A haulage system of this type with only a small tonnage depending on it can be manipulated over an undulating floor, since the cars in this case can be kept far apart. Too heavy a grade is also detrimental to smooth working, and about 8 per cent. represents the limit. With a higher grade than this trouble develops at the turn wheel, where the direction changes from the level to the down grade. Every time a car comes round the wheel, it suddenly runs forward with a vicious jerk and more often than not throws itself off the road and rope as well.

This haulage, however, possesses many worthy advantages and, provided it is applied under suitable conditions, is an economical and handy method of transportation.

Relation of the Mine Official to the Consumer*

By R. Z. Virgin†

SYNOPSIS—The mine official should view the coal sales from the viewpoint of the consumer, and he would then be more careful in supplying well-prepared coal of a size such as the consumer desires and tight, clean and easily unloaded cars delivered regularly as ordered.

There is a necessity for a new note to be sounded by mine officials if they would be successful. They should realize that in strictness they are not working in the employ of the company which has engaged them, but ultimately for the consumer who in the end pays all bills. His money keeps the industry going, and when the customers cease coming, the mine usually stops running.

Business stays only when care is taken of it. Give it more assiduous attention than the other fellow, and the result will be that all will have "quality coal" to sell and the consumer "quality coal" to burn and not bone, slate and other impurities. The customer will then have fewer clinkers, fewer ashes, cleaner grate bars and more efficiency.

The quality of the coal should be regular and therefore dependable, and the service rendered the consumer should be the best. The slow, inactive, indecisive and unconcerned mine official who has no thought of anything but quantity and cost and who entirely ignores the customer's requirements must sooner or later drop from the ranks of the leaders. For the customer's rights should always predominate. He knows what coal and service suit him best, and his rights to these preferences should not be abridged by the mine officials.

Every mine official who can arrange affairs at the mine so as to give the customer the service, quality and quantity he wants makes his company a reliable concern, and the consumer begins to bank on the shipper's service. This means more orders, more profits and better standing for the mine official.

Ascertain Consumer's Unloading Facilities

If possible, get the consumer to give you an idea of his unloading facilities, so that when he orders his car of coal you may know that his bin or siding will accommodate the equipment in which the coal is forwarded. In small plants and factories and in cities where storage is a factor, the length and height of the cars are important items to consider. It is necessary also to ascertain under what conditions the coal is used, the kind of place in which it is unloaded and what facilities are available. It is not well to send a 50-ft. car if the consumer's siding is only 40 ft. long, or a hopper car if the warehouse is suited only to a gondola.

If the consumer wants a car every alternate day, don't send him two cars and then skip three days and send him another. He might have to pay demurrage. The orders to the tipple-loading crew should be made flexible enough so that these men could select the coal for different customers in a manner that would suit their purpose.

For example, screened coal for use under a boiler need not be as large as coal going over the same screen to be used for domestic trade, where it is mostly used in stoves. After the tipple foreman has had much experience, he can detect a trip coming from the mines which has been dug by pick and can distinguish pillar coal from that which is mined and loaded after being cut by machine.

Mine officials should not argue with a customer. Adjust his grievance to his satisfaction, and if his business is unprofitable to you, tell him so frankly. An argument with a customer which led to a dispute over a matter of adjustment amounting to only $1 lost a coal company a profitable contract which it had enjoyed for several years and which was procured by mail-letter solicitation.

The coal should be primarily prepared at the coal face, and this preparation should continue until the fuel is screened and loaded. It is necessary to impress on those making the final inspection that the permanency of their jobs depends on the elimination of impurities.

Cars should be thoroughly cleaned and the holes roughly mended, so that shipments will reach the customer safely.

Careless Car Repairing Hinders Unloading

The repair used must be such that it will not inconvenience the customer in unloading the equipment. Heavy planks and pit rails should not be used to support drop-bottom doors, as a weight of 25 or 30 tons of coal on these planks makes them too tight to remove. If no planks are put in, no one need get under the cars to open the doors and no accident occurs from this cause. At the tipple a supply of quick-repair links, open links and a few bolts should be kept. Don't attach an engine to tighten hopper bottoms; perhaps the consumer has no such equipment to unfasten them.

An instance can be cited where a car had been used for hauling pig iron. Some of the iron froze to the floor, and when the car dropper loaded the car, he did not remove the iron because it was frozen fast. But the warm coal from the mine thawed the pig iron so that it became loose, and when the customer unloaded what he thought was merchantable coal, the pig iron with the coal fell into a crusher, and rolls costing over $200 were broken and the operation of the plant was delayed for several days because it was impossible to supply the stokers with the coal of the right size.

See that cars are properly routed so as to avoid expense, delay and disappointment in delivery to the wrong siding. If you do not have the equipment the consumer wants, advise him; don't send him a hopper if he wants a gondola unless he gives his consent.

Give the customer a correct billing of weights. If estimates must be made, try to get as close to the truth as possible, as overestimates will recoil. The figure you enter as the weight should be based on the average of several cars of the same class loaded with the same size of coal.

---

*Paper entitled "The Relation of the Mine Officers to the Consumer," read Dec. 8 at the meeting of the West Virginia Coal Mining Institute at Fairmont, W. Va.

†Superintendent, West Virginia-Pittsburgh Coal Co., Locust Grove mines, Colliers, W. Va.

If the customer inquires about a car or shipment, be courteous. Give him all the information available and don't say, "Shipment went forward as ordered, and it is now up to the railroad to make delivery." Speak kindly; a little interest in the consumer's needs costs but little.

The high-powdered, high-priced salesman with a glib tongue may secure the first order, but the continuance of the business is in the hands of the mine officials. The very lifeblood of the mine depends on the grace of the customers, and a paying plant covers a multitude of sins.

Photographing an Explosion

By John Pelligrino*

The accompanying photographs show an explosion which occurred on Nov. 13, 1915, at mine No. 7 of the McCormick Coal Co. (operated by the Sheridan Coal Co.), about 1½ mi. southeast of Arma, Crawford County, Kan.

This mine is 224 ft. deep and struck coal in January, 1915. The coal bed worked is about 3 ft. thick. The main entries run east and west and are now about 1,000 ft. long. The third set of entries are turned on the east side of the mine. Operation is on the room-and-pillar system, and about 150 men are employed. The coal is hauled to the bottom by mules and is raised on self-dumping cages by a steam hoist. The mine produces 500 tons of coal per 8-hr. day.

Some marsh gas is found every morning by the fireboss, whose duty it is to examine carefully every working place with a safety lamp and to dilute and render harmless such gas as is found.

I was notified on Nov. 13 that an explosion had occurred the day before at the mine which did not damage it very much as it was operated on that day. On Nov. 13, however, the barometer was falling low, and as weather conditions were favorable for an explosion, I decided that I would try to take a real photo of a mine explosion if one should occur that day. Immediately on arriving at the mine I prepared my kodak at a suitable place on a dirt dump about 75 ft. from the mouth of the shaft.

Owing to the dangerous conditions existing in this mine the Sheridan Coal Co. has installed a Schietzel electric shotfiring device. This explodes the shots at a time when all the men are out of the mine; consequently nobody's life is endangered while firing shots.

The miners prepare and tamp their shots and attach them to the electric wires, which are in each working place. About a half hour after quitting time, when all the men are checked out of the mine, the electrician in charge of the shotfirer explodes the shots by firing one entry at a time. There are therefore from 30 to 65 shots to be fired simultaneously in each entry.

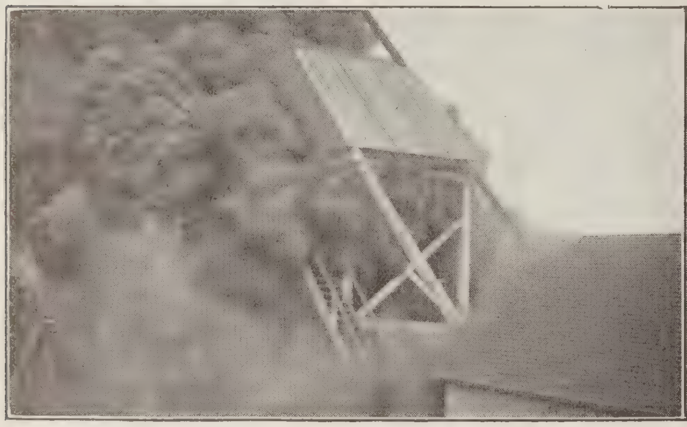

FIG. 1. THE MINE EXPLOSION

FIG. 2. TWO MINUTES AFTER EXPLOSION

On account of it being payday the mine only worked until 12 o'clock and the electrician commenced firing about 12:35 o'clock. He fired six entries without any trouble, but as soon as he threw the switch for the seventh

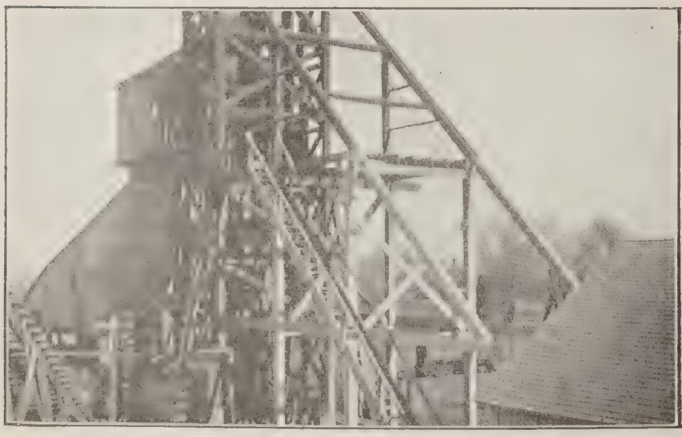

FIG. 3. THE TIPPLE UNOBSCURED BY SMOKE

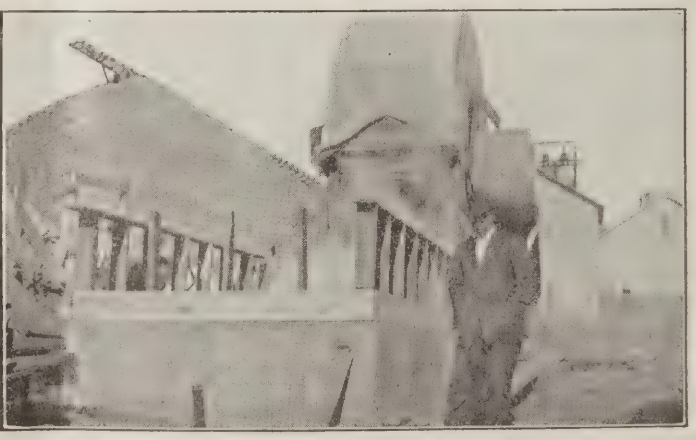

FIG. 4. FANHOUSE WRECKED BY AN EXPLOSION

entry the explosion occurred. I could hear a rumbling noise and a sound like a cannon going off. At the same time fire and smoke belched out of the mine, chunks of coal, timbers and boards commenced flying, while the dense smoke that enveloped the tipple and the noise of the timbers and boards cracking made it appear to me as if the tipple was falling over.

---

*State mine inspector, Pittsburg, Kan.

There was one cage hanging in the circles at the time the explosion occurred, but the force threw it out and wedged it tight above the circles. The smoke and fire went up in the air for about 500 ft., and it looked like a burning oil well. The smoke hung around the mine for about an hour after the explosion.

Fig. 1 shows the explosion at the moment it appeared on the surface. Fig. 2 was taken about two minutes after the explosion. Fig. 3 was taken on Nov. 23 from the spot where I snapped the explosion on Nov. 13. Fig. 4 was taken on Nov. 23 and shows how the roof of the fanhouse was blown off by another explosion occurring at this mine on Nov. 22.

⁂

Extracts from a Superintendent's Diary

Today we were honored by a visit from a man of whom none of us had ever heard. He introduced himself as a large stockholder of our company and informed us that the object of his visit was to see how the company was carrying out its moral obligations. He said that he was not personally acquainted with any of our directors, and that he had inherited his interest in our company.

He said that his block of stock was not large enough to give him voice in the company's management, no matter what his inclinations might be, but as he felt it to be his duty to at least post himself on the affairs of the company, he had decided upon today's visit.

I took him in hand personally and conducted him all over the property, both inside and aboveground. Then I introduced him to some of our most intelligent miners and company men. And finally I took him all through my residence and also the homes of several of our miners.

Then we went back to the office, and he began to ask questions, which I answered to the best of my ability.

By profession he is a college professor, and all of his ideas about labor problems have been obtained from books and magazines. His vocabulary was full of such terms as collective bargaining, minimum wage, paternalistic tendencies and industrial democracy. Sometimes I felt inclined to give him the kind of answers he so evidently expected rather than to suggest that no one within my knowledge could give him the information he sought, based on actual experience, but I managed to curb my inclinations somehow.

I attempted to explain to him that my convictions about labor unions and labor leaders were subject to frequent change, but he could not understand how such a thing could be possible, and it soon became evident that to his mind every attack that had ever been made on any labor leader was made from "whole cloth" behind locked doors at some employers' association. That any manager could voluntarily and of his own volition choose to give his employees a square deal was beyond his comprehension. Again and again he made use of the phrase "exploitation of labor," and it was evident that he believed that all labor lived but to be exploited.

Seeing that nothing could be gained by discussing things most intimately connected with my everyday life, I led him off into a discussion that had to do with stockholders. It had always seemed to me that inasmuch as the stockholders received all of the profits that were to be had, some of them ought to be gracious enough to tell the world at large that they appreciated profits and were glad that they could be obtained regularly with so little trouble.

But my ideas were not the ideas of my visitor. He believed that because of the fact that the management of a company rested solely in the hands of company officials, who were not under the control of the stockholders, but reported only to directors, it was unreasonable to suppose that the wishes of the stockholders were given serious consideration. How could he prove it? Why, that was dead easy—stockholders consisted of all classes of people from ministers to gamblers and from bankers to bootblacks, and surely the majority of them would not countenance the exploiting of labor. I couldn't get beyond that. Whenever anyone intimates that I am an exploiter of labor, I have to change the subject or lose my temper, so I am still ignorant of a possible motive that leads company managers to wring profits from their employees to be turned over to stockholders who resent the necessity of receiving them.

⁂

Mine Officials' Brotherhood

About a year ago a movement known as the "Mine Officials' Brotherhood" had its beginning in a convention of mine officials held in the City of Dubois, Penn. The membership of the organization thus formed has since been steadily increasing.

A second convention was held July 28, 1915, at Reynoldsville, Penn., at which the following were elected: James Ewing, president; John B. Morton, vice-president; G. S. Stewart, secretary-treasurer; H. H. Moody, George Alexander, George N. Blackley, William E. Richard and S. E. Clark, board of directors.

The organization receives into membership mine inspectors, superintendents, foremen, firebosses, assistant foremen, mining engineers, surveyors and assistants. In the last year two deaths occurred in the membership, for which assessments of $2 per member were made. The enrollment fee is $3, and the quarterly dues $1, payable every three months. The objects of the organization are:

1. To accumulate a fund so that at the death of a member the order will eventually pay to beneficiaries a sum not to exceed $2,000. At present the amount paid on the decease of a member will be equal to an asesment of $2 for each member in good standing. When the membership reaches 1,000, the full sum of $2,000 will be paid.

2. To maintain a closer relationship between mine officials and operators the organization will endeavor to keep its members in touch with operations where foremen or other officials are needed and will at the same time furnish operators with a list of available experienced men.

These objects should meet with the hearty approval and support of all operators and mine officials. The order especially wishes to call the attention of the mine officials in the anthracite field to this order and ask them to join with it in the bituminous field to swell the ranks and influence of the organization. Any desired information will be cheerfully given by the secretary.

Who's Who in Coal Mining

C. B. Dougherty

Thirty-six years ago C. B. Dougherty came into the office of the Susquehanna Coal Co. and took a position about as low in the scale of office work as it was possible to get. He was 18 years old when he became an office boy. He is older now, 18 plus 36, and he is still in the office of the Susquehanna Coal Co., but his title has been changed to assistant manager. That old saying about the "rolling stone" seems to have been a pretty good motto in this case.

In the summer of 1885 he was made chief clerk in the manager's office when Major Irving E. Stearns became general manager of the anthracite interests of the Pennsylvania R.R. (It ought to be said that the railroad and the coal company are no longer associated as they formerly were.) In his position as chief clerk he organized the purchasing department of the coal company. Before this time all purchases had been made by the individual collieries. He still takes an active interest in the operations of the purchasing department.

GEN. C. B. DOUGHERTY
Assistant General Manager, Susquehanna Coal Co.

In July, 1906, he was advanced to the position of assistant manager. All colliery operations are directed from the office of General Manager Quinn, and as assistant, General Dougherty has a share in the management of all departments.

Few men have been connected with the administrative side of anthracite operations for so long a time as General Dougherty, and many have been the changes that have come under his notice. To him the most notable change is that slow one from widely scattered private ownership to more concentrated corporate ownership, with the resulting change from entire lack of coördination in the activities of producers to some approach to order and regulation. Perhaps this is especially apparent to him in the operation of the purchasing department, for it is a long step from individual purchasing at each of many collieries to the purchasing for a large corporation at a central office, and probably there is no place about the operations where the economy of central management would be shown more clearly.

Here is another record, quite different but still that of the same man. Mr. Dougherty entered military life as a private in Company B, Ninth Infantry, in 1881. He was soon made regimental clerk, and a year later he became principal musician. In 1883 he was appointed sergeant major and reappointed in the two succeeding years. In 1887 he became first lieutenant and inspector of rifle practice. In 1892 he was elected major in the Ninth Infantry, and 1894 he became lieutenant colonel. In 1897 he became colonel.

In 1898 the regiment was mustered into the service of the United States. For a considerable time Colonel Dougherty was in command of the Third Brigade, Third Division, First Army Corps, and was in command when his regiment was mustered out.

In 1899 the regiment was reorganized and reëntered the service of the National Guard of Pennsylvania. In 1906 Colonel Dougherty was appointed brigadier general, and in 1901 he was appointed major general to command the division.

General Dougherty is a thirty-second degree Mason, a member of the Westmoreland and Franklin Clubs of Wilkes-Barre, the Scranton Club, the Engineers' Society of Northeastern Pennsylvania, the Wyoming Valley Country Club, the Pennsylvania Society of the Sons of the Revolution, the Military Order of Foreign Wars and the Naval and Military Order of the Spanish American War. He was first state commander of the last organization. He is serving his third term on the State Armory Board. For three successive years he has been president of the National Guard Association of Pennsylvania.

In spite of all this he finds time to do his work for the coal company, read the *Atlantic Monthly* and live up to his reputation as a tip-top good fellow and a friend worth knowing.

Invention for Safety First

An invention to be used for the motion-picture campaign in behalf of "safety first," which has been initiated among its anthracite miners by the Delaware, Lackawanna & Western Railroad Co., is a projecting machine that can be used for either lantern slides or films with both direct current and storage batteries. This will enable the safety-first organizations of the company to take the pictures right into the miners' homes.

In addition to the safety-first organization of the officials of the coal-mining department there is a separate organization among the safety inspectors, driver bosses and firebosses, which holds its separate meetings and periodic discussions of the ways and means of preventing accidents.

While the increase in the use of electric lighting has been rapid in the anthracite region, there are still many miners' houses without electric wiring, and the new projecting machine—the only one of its kind—facilitates exhibitions in every community, whether supplied with electric current or not. It enables the safety organizations to show the miner's wife and children the perils to which he exposes himself if he is in any degree reckless, and the miners pay heed to these warnings. The company's motion-picture play entitled "The Price of Carelessness" is an impressive exhibition of this sort.

Editorials

Starting the New Year

Right now when we are on the eve of another year is the time to make new plans, with the idea of increasing our efficiency and thereby improving our prospects of success. The mistakes we have made are now entered on the ledger of experience, and our resolutions include a determination to avoid the same error again.

The Foreword in this issue of *Coal Age* suggests that we record our new resolutions and that we make them only after the most mature deliberation. The chief idea is to keep all our promises, for a good resolve broken is an act that will seriously impair the will. On the other hand a good resolution when kept produces a new habit, and a new habit soon becomes a part of oneself.

It isn't our own experiences alone that should profit us, but the experiences of others who have met and conquered the same problems we meet in our everyday life. For this reason the present moment is an excellent time to ponder on the wisdom of men who have succeeded.

It was Franklin who said, "Being ignorant is not so much a shame as being unwilling to learn." He was a plodder and was able to do so much mental labor because of the simple life he led. Like most great men who lived to an old age, he was a careful eater and a small one. He remarked once, "I have seen few die of hunger; of eating—100,000." It was also Franklin who wrote, "If you know how to spend less than you get, you have the philosopher's stone."

Of all the great merchants America has produced Marshall Field stands preëminent as a man who was not only a financial success, but who was a success from all moral and human standpoints. His twelve rules of life were:

Remember—

1. The value of time.
2. The success of perseverance.
3. The pleasure of working.
4. The dignity of simplicity.
5. The worth of character.
6. The power of kindness.
7. The influence of example.
8. The obligation of duty.
9. The wisdom of economy.
10. The virtue of patience.
11. The improvement of talent.
12. The joy of originating.

Marshall Field went to Chicago practically penniless, but he was determined to succeed and made it the rule of his life to keep away from all associates who might discourage him. He learned early in his career that the cornerstone of any honored life must be a good reputation.

If we don't avoid small faults, little by little we fall into greater. It isn't only the hours that we spend at our labor that influence our lives. The way in which we spend our hours of freedom either increases or decreases our personal efficiency. It should never be forgotten that the great combat of our lives is the fight to overcome ourselves. Therefore let us all write down our new resolutions, and let these new resolves cover those faults in our personal conduct that are keeping us back and in many cases dragging us down. There is nothing more terrible than the cry of the man in his old age—If I had only done the things I should have done.

"He missed his opportunities!" How often we hear this expression. No act or accident of a man's life is insignificant; the most trifling may be the germ of his destiny. Opportunities are not as common and frequent as milestones by the roadside; however, there is always something to be done that is awaiting the coming of somebody who can do it well.

* * *

Steam-Shovel Methods

When the United States Geological Survey published its "Production of Coal in 1913," there was no mention of steam-shovel mining, but in the record for 1914 this information is available. Of course only the concerns which are mining coal for sale have furnished data, and only the bituminous coal mines are included. But in these pits it is noteworthy that the ratio of cover removed to coal obtained is six to one. In Illinois the ratio is 3.86 only, but in Oklahoma, where the coal is only 22 in. thick, the cover removed is 10 times as thick as the coal uncovered.

Steam-shovel mining has been received with the utmost scepticism, but once adopted it has a way of spreading fast. There are now 48 shovels at work in the bituminous mines alone, 40 of these operating on the cover and 8 on the coal. The strip pits did not work quite as regularly as the average bituminous mine, the former working 187 days and the latter 195. But the output per man was large nevertheless. The average for all the strip-pit workmen was 945 tons per year, or 5.06 tons per working day. The average bituminous-mine worker last year produced only 724 tons, or 3.71 tons for every day that he worked. Both mine worker and strip-pit employee failed to reach a maximum yearly tonnage owing to the state of the market.

The steam shovel has come to stay, and there is no reason why it should be used only in Illinois, Kansas, Missouri, Indiana and Oklahoma. It is well suited to mining along the outcrops of hilly countries; it is available where coal is found in basins beneath prairie ground. The seams of coal now being uncovered in bituminous practice are thin, nowhere exceeding 6 ft. in thickness, and the cover removed is nowhere in excess of 26 ft., but there is nothing to prevent greater depths of cover from being shoveled away where the coal is thicker and of more value as in the anthracite region—nothing, that is, but the fact that the strip-pit industry is in its infancy and few seem disposed to give it the favorable consideration it deserves.

Conspiracies Against the West Virginia Coal Trade

Governor H. D. Hatfield spoke most forcibly at the recent meeting of the West Virginia Coal Mining Institute. He bitterly denounced those who protested against his pet legislative schemes. But is it not to be presumed that the coal operators of West Virginia have a right to protest even against a real governor if they think his schemes are opposed to their own or the public good?

We do not suppose there is any state in the Union where an outcry would not arise if a tax was about to be laid upon coal in that state and not in all those competing. Nor is it unnatural that coal operators who for two years have run their mines on a narrow margin are disposed to protest against more drastic laws. Moreover, it is permissible for operators to seek a workmen's compensation law which will not be too severe. But apparently Governor Hatfield thinks that protests of the kind mentioned are a veritable evidence of depravity.

There is no need for vehemence such as Governor Hatfield showed, nor any need at all for vindictiveness. There is a great need, however, for that broad cosmopolitanism that realizes that two thoughts entirely different and contradictory may be held without involving bitter controversy and suspicion.

In fact there are people in West Virginia today who regard as a conspiracy every act and the expression of every opinion inimical to them. They are particularly sure that this is true if the critic or the corporation does not reside in the state.

For instance, Colonel Dawson in his address before the State Board of Trade of West Virginia at Fairmont declared that he regarded the tearing up of sidetracks under coal tipples, the arbitrary refusal of needed cars and other like acts in the years 1900 and 1904 as evidences of a conspiracy in favor of Pennsylvania and Ohio and against West Virginia. But these same illegal acts were quite common at one time in Pennsylvania before West Virginia was an important coal-producing state. Perhaps because there were no West Virginia mines was why Pennsylvania operators put a different interpretation on the actions of the railroads and alleged that the cause of these remarkable interferences with business was that the railroad officials wanted a part in the development or the exclusive control of all the mines on the railroad. Only in West Virginia have these actions been declared to be attempts to enrich one state at the expense of another.

Then again Colonel Dawson declares that the Chesapeake & Ohio Ry. is willfully preventing West Virginia coal produced along its lines from reaching Eastern cities. A glance at the map would readily show why that railway demands rates which prevent the operators along its lines from competing in the East with the much nearer and equally desirable coal of the Clearfield, Cambria and Somerset fields of central Pennsylvania.

In fact the main conspiracy to which Colonel Dawson has referred may be found devoid of irregularity in a court of law.

It is hard to believe that in a free country it is a conspiracy to agree to ask a public commission to increase freight rates. Surely when that principle is established it will be a crime for citizens to meet and agree to urge the passage of a law. But it seems improbable that the Interstate Commerce Commission will allow railroad rates to be raised in West Virginia and in Pennsylvania, even despite the now more favorable attitude of the public. In fact it looks as if the whole project may fall to the ground and as if the matter is but a "colossal bluff" to induce Ohio operators and miners to relinquish their action before the Public Utilities Commission. The action alleged to have been taken in regard to Pittsburgh rates appears to confirm that view.

It only remains to regret that the air is filled with rumors of conspiracies, most of which are purely figments of the imagination. Colonel Dawson, who accuses the coal operators and miners of neighboring states of entering into a conspiracy and who declares that the Pennsylvania R.R. and the Pittsburgh Coal Co. are plotting together against West Virginia, also states that "the brass collar of the Pennsylvania R.R. and its allied interests must indeed be welded (sic) strongly around the neck" of *Coal Age*.

He does indeed protest too much. Many of his arguments that there is a conspiracy are in no way conclusive, and only one has direct reference to the present situation. It is more reasonable to believe that in the three states involved and in Tennessee and Kentucky also there is no desire to put anyone out of business. There is in all a disposition to remember that an established plant must not be wrecked by inconsiderate and sudden reversions even to an equitable ton-mile basis. The vested interests of the West Virginia people need much consideration, and none can object to any success they may have as a result of the excellence of their fuel, but by ton-mile rates of exceptional liberality they should not be allowed to overrun every state east of the Mississippi. The change in rates to prevent their continual absorption of the markets of other states might well be made progressive, say 5c. per year. In this way West Virginians could slowly conform themselves to altering conditions.

With these views some will find fault. None of us is infallible. We surely should be able, however, to argue out an issue of this kind without any expression of bitterness or any imputation of bad faith.

⁂

Is this the kind of Christmas you are having in your house today? If it isn't, perhaps the fault is your own. Are you doing the best you can for the wife and kids? There is another Christmas coming next year.

Discussion by Readers

Purchase and Sale of Coal

Referring to the question of the purchase and sale of coal and the fluctuation in the price for different grades, as discussed in the last issue of *Coal Age,* page 1026, it might be of value to call attention to the practice of figuring relative prices of the different grades at the mine rather than at the destination. For example, one coal may sell at $1 per ton f.o.b. cars at the mine, while another coal considered to have a 10-per cent. greater fuel value than the first is sold at $1.10 per ton f.o.b. cars at the mine.

For the sake of illustration, suppose the consumer pays a freight of 70c. per ton. This freight is the same regardless of the quality of the coal. He therefore pays $1.70 per ton for the inferior coal at the point of unloading and $1.80 per ton for the better coal, which is a difference of only 10c. per ton, or 5.8 per cent. of the delivered price. This percentage of difference is still further reduced when the cost of unloading and delivering the coal to the firebox is considered.

In my opinion, the 10-per cent. better grade of fuel should be worth at destination at least 10 per cent. of the delivered price ($1.70), or 17c. per ton more than the inferior grade, making its price $1.17 f.o.b. cars at the mine. Even this method of estimating the price would take into account none of the economies of the better fuel by reason of the reduction in the labor required per horsepower yielded and the greater power furnished per dollar of investment.

Under the existing custom or practice, the higher the freight rate that a customer must pay on his coal the greater is the likelihood that the best fuel he can buy will prove the most economical in the end, as I know of no case where a coal dealer or operator computes his price on the cost of the coal at destination, as I have suggested. For the sake of comparison, suppose a dealer has two customers who pay 30c. and 90c. per ton freight rates respectively. Then, assuming the dealer has two grades of coal, one of which has a 10-per cent. better fuel value than the other, if the inferior coal sells at $1 per ton f.o.b. cars at the mine, the prices to these two customers for this coal at destination would be $1.30 and $1.90 respectively, while the prices of the higher-grade coal would be $1.13 and $1.19 per ton f.o.b. cars at the mine.

Here is a difference of 6c. per ton at the mine in the prices quoted to these two customers. This difference is based entirely on the difference in their freight rates, but no one can say that these prices discriminate against the man who pays the higher freight rate. It must be admitted, however, that a purchaser of coal often receives quotations from different districts involving different freight rates, and this further confuses the problem. In such case the buyer must estimate the relative merits or qualities of the different grades of coal offered and compare the price differentials, not as given f.o.b. cars at the mine, but as delivered to his coal bins. By so doing, I think he will often be surprised to learn how much cheaper a high-grade fuel sold at a higher price may prove.

We cannot blame the South American trade for standing so closely by the high-grade Welsh coal when we consider that the costs of transportation and handling together amount to several times the cost of this coal at the mine and, further, that all this cost is on a per-ton basis and not on a heat-unit or B.t.u. basis. It it conceivable that under such circumstances we might give away at the mine a mediocre coal and still our American neighbor would turn it down in favor of a high-grade coal for which he must pay $2 per ton f.o.b. cars at the mine. In so doing, we must allow he would show excellent judgment. So much per ton of coal at the mine is the logical way for the producer to sell his coal, and yet the system may often prove misleading to one who does not go into the matter thoroughly.

Correct Tipple Design

Referring to the letter of J. B. de Hart, *Coal Age,* Oct. 23, p. 683, the minor points to which he draws attention hardly merit a reply, being points in regard to which difference of opinion may exist in practice. However, for the satisfaction of interested readers I will offer a few brief explanations.

Mr. de Hart does not consider it good practice to have a topman act also as lampman in mines of 600 tons' capacity. Neither do I. Moreover, the mining laws of many states require that the topman be at his post a half-hour before the hoisting of coal begins and remain for a half-hour after it ceases, which would prohibit a topman from acting in any other capacity. It will be noticed that my article, *Coal Age,* Sept. 18, p. 450, reads, "Mines having a capacity not exceeding 600 tons, where the topman also acts as lampman," etc., which obviously does not recommend the practice.

However, there is nothing in the Mines Act of the Province of Alberta to prohibit such practice, and where the tonnage is low and comparatively few men are working, the topman can give out lamps in the morning and clean them after the men come out of the mine at night without in any way interfering with his duties as prescribed by the act. The handling of lamps, as thus suggested, has worked well in practice even to the replacing of injured lamps during working hours. No confusion has been experienced by reason of an injured lamp coming out of the mine without a check, which has been attached to the lamp given in its place, and responsibility for the damage has always been readily fixed.

There can hardly be a difference of opinion on the question of danger from spontaneous combustion owing to the storing of refuse from the tipple in the bins below the picking-room floor. These bins are only 7 ft. in depth and must be emptied at least once a day. The worst conditions in respect to bony coal could not introduce the danger of spontaneous combustion or even cause a perceptible rise of temperature in that time.

Whenever possible it is better practice to weigh mine cars at the shaft bottom. Such a system is being introduced in many of the larger mines, especially those using machines, and it presents no difficulties in respect to properly crediting each miner with his coal.

In Fig. 3 of my second article, Sept. 25, p. 502, by a draftsman's error the forward leg of the headframe is shown as approximately parallel to the resultant of the cable stress. But the reference to this point on page 450 of the first article reads, "The forward leg of which (A-frame) is carried down to the ground outside of the resultant of the cable stress."

While writing I would call attention to the fact that in Fig. 2, page 451, the left-hand chute leading from the valve and receiving hopper should have been marked "local coal chute" instead of "scatter pan."

Output of British Coal Mines

Letter No. 2—Though I have not seen the paper read by Mr. Dean before the North of England Institute of Mining Engineers and referred to in the editorial, *Coal Age*, Nov. 6, p. 762, it seems to me that the statements made are far off the mark. One is led to suppose that the American coal operators are most farsighted and employ better equipment in their mines than the coal operators of Europe.

Conditions Existing in Welsh Mines

The reasons that more coal is produced per man per day in this country than in Great Britain are: (1) Because the coal here is almost universally blasted with powder. (2) The coalfields are better adapted for machine mining. (3) The coal is universally loaded into the mine cars with a shovel. Compare this with conditions as they exist in the mines of South Wales, where I gained my mining experience. In those mines all the coal is mined by pick, sledge and wedge except in the nongaseous mines of the anthracite field. No blasting powder of any kind is used in the gassy mines. Also, it is impossible to use coal-cutting machines there because of the slips in the formation, which lie at an angle of about 45 deg.

In all steam-coal mines the miner uses a coal pan to carry his coal from the face to the "box," or car, to be loaded. He only loads lump coal, the fine coal and slack being thrown back into the gob. If miners in this country had to contend with these conditions, their output of coal would be less than that of their brothers in Great Britain because, owing to the slips in the coal and the gas pressure that greatly assists the mining, Welsh coal is more easily mined than American coal.

The Question of Mine Equipment

The suggestion of building larger equipment is idle talk, as British mines are noted for their equipment, which is uptodate and serves their conditions. No wood is used to line the shafts or in the building of engine houses and boiler plants, except for doors and flooring. I recall one company that planned to spend £200,000 ($1,000,000) in the sinking of two circular shafts 1,050 ft. deep and 21 ft. in diameter. The engine at the hoisting shaft consisted of a pair of 32-in. cylinders, while the drum was 18 ft. in diameter. Two cars of coal were hoisted at a time, each car containing from 3,000 to 3,500 lb. of coal. The mine employed 1,400 men, 500 of whom were night men, although no coal was hoisted at night, these men being employed as laborers and in making repairs. It was expected to hoist 2,000 tons a day in this shaft. The same company had previously operated one house-coal and four steam-coal mines. I remember the balance sheet for one year showed an output from all these mines of over 1¼ million tons and an average profit of 48c. per ton.

Natural Conditions in the Mines

I want to ask why the companies should provide larger boxes for loading hand-picked coal. Would the miners load more coal? But the larger boxes would require greater labor in loading and handling. When working in coal from 6 to 7 ft. thick, a good miner will load from 4 to 5 tons of coal a day, but this is lump coal and not run-of-mine.

Again, it does not follow that if the seam of coal is thin the height of the entries and rooms is correspondingly low. I worked in one mine where the coal was 22 in. thick. It was over 2½ mi. from the entrance to the inside parting in the mine. The main- and tail-rope system of haulage was employed. I do not remember that I had to stoop once in this mine, and I am over 6 ft. tall. I used to stand full height above the rail in the room. When it comes to "brushing" roof or lifting bottom to make headroom, we cannot instruct the miners of South Wales. In this mine a man and a boy would load from 70 to 75 cwt. of run-of-mine coal a day. Was it not easier to load four boxes of 18 cwt. each than, say, two boxes of 36 cwt. or one box of 72 cwt.? As a fact, the size of these boxes is estimated from the output expected from each place.

The Underground Haulage

In view of these facts, it needs no argument to prove that "rats of mules or ponies" are not used in those mines. Indeed, no mules are used underground in South Wales. The British mining law is strict in requiring that sufficient height must be maintained on all roads for the passage of horses, and any rubbing of the horses or their harness against the roof or timbers in any part of the mine would mean the conviction of the guilty parties. The type of horses employed in these mines compares favorably with the mules used in any mines in Illinois, and it is safe to say that our operators can take lessons in the stabling, care and treatment of mine animals from the South Wales mines.

Regarding Ventilation

To the best of my knowledge and experience, the "union" does not interfere with the miner with respect to the amount of coal he can load. In regard to the mines of South Wales being extremely "warm," it must be remembered that the coal lies at a greater depth below the surface, where the natural heat of the strata cannot be entirely removed or overcome by a more perfect system of ventilation, were this possible. Welsh mines are equipped with most efficient fans, and the circulation and distribution of the air in these mines are in all respects uptodate. The water gage of 2½ to 3½ in. in those mines is not always the result of long aircourses or restricted area, but is owing to the circulation of air volumes varying from 150,000 to 250,000 cu.ft. per min. As early as 1887, and since then, the mining law of Great Britain has contained the following general rule:

> An adequate amount of ventilation shall be constantly produced in every mine to dilute and render harmless noxious gases, to such an extent that the working places of the shafts, levels, stables and workings of the mine, and the traveling roads to and from those places shall be in a fit state for working and passage therein.

Many miners who have worked in these mines and are now in this country can testify to the fact that, though much gas was generated in the mines, this law was strictly kept. The new mining law goes one step farther and reads as follows:

> An adequate amount of ventilation shall be constantly produced in every mine to dilute and render harmless inflammable and noxious gases, to such an extent that all shafts, roads, levels, stables and workings of the mine shall be in fit state for working and passing therein; and, in particular, that the intake airways, up to within 100 yd. of the first working place at the working face, which the air enters, shall be normally kept free from inflammable gas. . . .
>
> For the purposes of this section, a place shall not be deemed to be in a fit state for working or passing therein if the air contains either less than 19 per cent. of oxygen or more than 1¼ per cent. of carbon dioxide, and an intake airway shall not be deemed to be normally kept free from inflammable gas if the average percentage of inflammable gas found in six samples of air taken by an inspector, in the air current in that airway, at intervals of not less than a fortnight, exceeds ¼ [per cent.]

The law, however, provides for the exemption of a mine liable to spontaneous combustion by order of the Secretary of State on certain specified conditions. In all Welsh mines air leakages are reduced to a minimum. I fail to recall a single instance where less than two substantial wooden doors separated the intake and return airways, and frequently three separation doors would be used at the shaft bottom. The mining law provides that no two doors shall be opened at the same time in the same crosscut. These doors are built into a wall of stone or brick laid in mortar, and brattice cloth is nailed to the bottom of the door to prevent leakage at that point.

ELECTRIC HAULAGE NOT POSSIBLE

Electric haulage in the mines of South Wales cannot be considered, owing to the danger of explosion of gas and dust. In the investigation of the explosion at Senghenydd, it was thought that the use of 9 volts for electric signaling gave too small a margin of safety, since it requires but 13½ volts to produce sparking of the wires. The rope haulage in present use must therefore continue.

I cannot see that the size of railroad cars used in Great Britain has much to do with the output of the mines. In this country the railroads build practically all the cars, and the size of the car is made with respect to the average length of fall. While it is not uncommon in this country to haul a distance of 300 mi., the longest haul in South Wales does not exceed 30 or 35 mi. The operators in that country build their own cars to suit their particular needs. They consider there is an advantage in using a small car with side doors opening outward in the middle of the car, which facilitates the unloading of the car and reduces the amount of breakage of the coal. One can hardly conceive of a car more difficult to unload than the ordinary type of car used in this country. In Great Britain cars that are to be unloaded at the wharfs are provided with end gates, which are most convenient for that purpose. The breakage of the coal is an important feature there, since the price of lump coal is more than double that of screening.

I have worked in coal mines in both countries, and while my output of coal in Great Britain ranged from 2 to 5 tons per day depending one the thickness of the seam. I have loaded 15 tons per day in Illinois, at the same time drilling and shooting the coal and clearing away slate and timbering. This difference of output is evidently not in the mine equipment, for no expense was spared in either case; it is simply owing to the difference in the natural conditions of mining coal in the two countries. It is not for us to boast of our good heritage in this country; instead, let us learn from European operators to demand a fair price for coal and not permit competition to so lower the value of coal at the mines that we are said to give it away. We must acknowledge that operators in foreign countries are as uptodate in most respects as their American brothers. W. L. MORGAN.

East St. Louis, Ill.

"Dont's" for Mine Motormen

In addition to the list of "dont's" for mine motormen given by James Thomas Reynolds, *Coal Age,* Nov. 20, p. 840, and the two suggested by Edward H. Coxe, Dec. 11, p. 984, I want to suggest two very important ones, which are as follows:

Don't get out of your motor while it is in motion and run alongside of it to clean out the sand-pipes. In doing this you may come in contact with some obstruction at the side of the road or have your fingers or jacket caught under the wheels, which might result fatally.

Don't climb over the top of your motor while it is in motion in order to fix or clean your headlight. In doing so you may strike against the roof or come in contact with a low timber or wire and be seriously if not fatally hurt.

California, Penn. WILLIAM THOMAS JENKINS.

Efficient Mine Foremen

Letter No. 14—There seems no end to the practical mining questions discussed in *Coal Age.* I have been much interested in reading the discussion of the "Efficiency of Mine Foremen." The views presented by different ones who have taken part in this discussion agree thoroughly with my own observations. I have had experience with various kinds of mine foremen, and while some were all you could desire or ask, others were slack in discipline and careless and neglectful of their duties. Some drank to such an extent that they lost their positions, yet all of these men retained their certificates of competency.

There are foremen at the present time who are capable of managing mines successfully and yet are seeking work, while others are wholly unfit for the positions they hold. Many foremen expect too much of their assistants and leave too much in their charge that they should attend to personally.

I regret to say that the mine foreman is not generally valued according to his ability to produce results if one might judge from the pay he receives for his services. As has been said, mine foremen are often hindered in the performance of their duties required by law because of the lack of support given them by higher officials of the company. In the rapid advance of mining more is required of mine foremen and firebosses than formerly, as in many cases the territory in their charge is too large for them to give it the attention it should receive. The bituminous mine law of Pennsylvania requires that a second examination of every working place where men are employed shall be made during working hours by the fireboss. But how is this to be done if he is to give proper instruction to the men on his rounds? He is often delayed by assisting someone to lift a car onto the track or to sight an entry or by performing some other service that is needed. A Reader.

Burgettstown, Penn.

Claims Credit for Double Entry

I am pleased to notice the consolidation of the *Colliery Engineer* with *Coal Age,* giving us a weekly mining paper in place of a monthly. I want to refer briefly to an article published in the October issue of the *Colliery Engineer,* page 142, by my old friend, Walton Rutledge, on "Early Mining in Illinois."

In this article Mr. Rutledge shows the old method of single entry used so extensively in those days. A door was placed at the mouth of each room, and when a driver was gathering the cars for a trip, these doors were open half the time. As a result the air short-circuited at that point, passing through the open door, and the faces of the rooms outby on that entry were cut off. It was a miserable system of ventilation.

At that time I was part owner and general manager of mines at Brazil, Ind. In the early eighties I went to Staunton, Ill., to take charge of mines at that place. It was there that I saw the absolute necessity of employing double or triple entries, as the mines were poorly laid out and there was about 30 acres of old workings on fire and sealed with the poorest kind of stoppings. This was the first place where I planned and instituted the double-entry system, which was at once adopted quite generally throughout the state on what was, I believe, known as the "Morris plan." I sold maps of my plans, which were sent broadcast to many mines throughout the country. Many of these maps were sold by the *Colliery Engineer.*

I notice with some regret that Mr. Rutledge failed to give me due credit for the system. The panel system that he described is nothing more than double entries driven in blocks to the boundary line, the blocks being then cut through and the panels worked back, as in longwall retreating. William M. Morris.

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

CONVERSION OF COMPOUND UNITS

In the conversion of compound units from the United States to the metric system, and vice versa, it is more convenient and saves much time and frequently avoids error arising from confusion of terms to employ a single factor. The following are the more common conversion factors:

WEIGHT PER UNIT LENGTH

1 lb. per ft	(0.4536 × 3.28)	= 1.488 kg. per m.
1 lb. per yd	(0.4536 × 1.0936)	= 0.496 kg. per m.
1 ton per mi	(0.9072 × 0.6214)	= 0.5637 tonnes per km.
1 long ton per mi	(1.016 × 0.6214)	= 0.6313 tonnes per km.

WEIGHT PER UNIT AREA

1 lb. per sq.ft	(0.4536 × 10.764)	= 4.882 kg. per m^2
1 ton per sq.ft	(0.9072 × 10.764)	= 9.765 tonnes per m^2
1 ton per sq.yd	(0.9072 × 1.196)	= 1.085 tonnes per m^2
1 ton per acre	(0.9072 × 2.471)	= 2.2417 tonnes per hectare
1 long ton per acre	(1.016 × 2.471)	= 2.5105 tonnes per hectare

WEIGHT PER UNIT VOLUME

1 oz. per cu.in	(28.35 × 0.06102)	= 1.73 g. per cm^3
1 oz. per cu.ft	(0.0283 × 35.3145)	= 1.00 kg. per m^3
1 lb. per cu.ft.	(0.4536 × 35.3145)	= 16.0184 kg. per m^3
1 lb. per cu.yd	(0.4536 × 1.308)	= 0.5933 kg. per m^3
1 ton per cu.yd	(0.9072 × 1.308)	= 1.1866 tonnes per m^3
1 ton per acre-ft	(0.9072 × 8.106)	= 7.3538 tonnes per hectare-m.
1 long ton per acre-ft	(1.016 × 8.106)	= 8.2357 tonnes per hectare-m.

It is worthy of note that **ounces per cubic foot** are equivalent to **kilograms per cubic meter,** or **grams per liter,** since 1 m^3 = 1000 liters.

WEIGHT PER UNIT CAPACITY—LIQUID

1 gr. per gal.—U. S.	(64.8 × 0.264)	= 17.107 mg. per l.
1 oz. per gal	(28.35 × 0.264)	= 7.484 g. per l.
1 lb. per gal	(453.59 × 0.264)	= 119.748 g. per l.
1 gr. per gal.—Gt. Br.	(64.8 × 0.22)	= 14.256 mg. per l.
1 oz. per gal	(28.35 × 0.22)	= 6.237 g. per l.
1 lb. per gal	(453.59 × 0.22)	= 99.790 g. per l.

WEIGHT PER UNIT CAPACITY—DRY

1 lb. per bu.—U. S.	(0.4536 × 28.378)	= 12.872 kg. per stere
1 lb. per bu.—Gt. Bt.	(0.4536 × 27.51)	= 12.479 kg. per stere

PRESSURE

1 oz. per sq.in	(28.35 × 0.155)	= 4.394 g. per cm^2
1 lb. per sq.in	(453.59 × 0.155)	= 70.306 g. per cm^2
1 lb. per sq.ft	(0.4536 × 10.764)	= 4.882 kg. per m^2

WORK

1 inch-pound	(2.54 × 453.59)	= 1152.1 gram-centimeters
1 foot-pound	(0.3048 × 0.4536)	= 0.1383 kilogram-meters
1 ton-pound	(0.3048 × 0.9072)	= 0.2765 tonne-meters

The Coal Age Pocket Book

WORK IN HEAT UNITS

1 B.t.u.—778 ft.-lb.	(778 × 0.1383)	= 107.564 kg.-m.
1 pound-calorie	(107.564 × 1.8)	= 193.615 kg.-m.
1 calorie	(193.615 × 2.2046)	= 426.844 kg.-m.

CALORIFIC OR HEATING VALUE

1 B.t.u. per lb	(0.252 × 2.2046)	= 0.55556 cal. per kg.
1 B.t.u. per lb	5/9 (2.2046)	= 1.22478 lb.-cal. per kg.
1 B.t.u. per cu.ft	(0.252 × 35.3145)	= 8.89925 cal. per m^3
1 lb.-cal. per lb	(0.4536 × 2.2046)	= 1,00000 cal. per kg.
1 lb.-cal. per lb		= 2.20462 lb.-cal. per kg.
1 lb.-cal. per cu.ft	(0.4536 × 35.3145)	= 16.01866 cal. per m^3

POWER

The metric horsepower (force de cheval), which for convenience may be abbreviated **"cheval,"** is the power capable of performing 75 kg.-m. of work per second, or 75 × 60 = 4500 kg.-m. per min.

1 horsepower	(33,000 × 0.1383)	= 4563.9 kg.-m. per min.
1 horsepower	(4563.9 ÷ 4500)	= 1.0142 chevals
1 cheval	(4500 ÷ 4563.9)	= 0.986 hp.

POWER FACTORS

1 sq.ft. per hp	(0.093 × 0.986)	= 0.0937 m^2 per cheval
1 cu.ft. per hp	(0.028 × 0.986)	= 0.0276 m^3 per cheval

FUEL OR WATER CONSUMPTION

1 lb. per hp.-hr	(0.4536 × 0.986)	= 0.4472 kg. per cheval-hr.
1 ton per hp.-hr	(0.9072 × 0.986)	= 0.8945 tonnes per cheval-hr.
1 gal. (U. S.) per hp.-hr	(3.785 × 0.986)	= 3.7320 liters per cheval-hr.
1 gal. (Gt. Bt.) per hp.-hr.	(4.544 × 0.986)	= 4.4804 liters per cheval-hr.

EVAPORATION FACTORS

1 gal. per sq.ft.—U. S.	(3.785 × 10.764)	= 40.7417 l. per m^2
1 gal. per lb. fuel	(3.785 × 2.2046)	= 8.3444 l. per kg.
1 gal. per B.t.u	(3.785 × 3.968)	= 15.0189 l. per cal.
1 gal. per B.t.u	(3.785 × 1.8)	= 6.8130 l. per lb.-cal.
1 gal. per sq.ft.—Gt. Bt	(4.544 × 10.764)	= 48.9116 l. per m^2
1 gal. per lb. fuel	(4.544 × 2.2046)	= 10.0177 l. per kg.
1 gal. per B.t.u	(4.544 × 3.968)	= 18.0306 l. per cal.
1 gal. per B.t.u	(4.544 × 1.8)	= 8.1792 l. per lb.-cal.

EQUIVALENTS IN AIR MEASUREMENTS

Atmospheric pressure, sea level, normal, 14.696 lb. per sq.in.

(14.696 × 0.0703) = 1.033 kg. per cm^2

(14.696 ÷ 0.4911) = 29.925 in. mercury

(29.925 × 25.4) = 760 mm. mercury

$\left(\frac{29.925 \times 13.6}{12}\right)$ = 33.9 ft. water column

(33.915 × 0.3048) = 10.34 m. water column

The specific gravity of mercury (32 deg. F.) being 13.593, 1 in. barometer (standard reading) corresponds to 13.6 in. water gage and, roughly, to (13.6 × 815) ÷ 12 = say 900 ft. air-column.

Inquiries of General Interest

Lifting Power of Hydrogen

(a) I would like to know how much a cubic foot of hydrogen gas will lift at a temperature of 60 deg. F. and a barometer of 30 in., assuming the gas is confined in a bag and disregarding the weight of the bag. (b) Is there any gas lighter than hydrogen? STUDENT.

Enterprise, Iowa.

(a) The lifting power of any gas is equal to the difference between the weights of equal volumes of that gas and air at the same temperature and pressure. Under these conditions a cubic foot of dry air weighs 14.418 times as much as the same volume of hydrogen. Then, since 1 cu.ft. of air at 60 deg. F., barometer 30 in., weighs 0.0766 lb., the same volume of hydrogen, at the same temperature and pressure, will weigh $0.0766 \div 14.418 = 0.0053$ lb. Therefore, the lifting power of hydrogen at this temperature and pressure is $0.0766 - 0.0053 = 0.0713$ lb. per cu.ft. of the gas.

Expressed as a rule, the lifting power of any gas per cubic foot is equal to the density of the air (weight per cubic foot) at the given temperature and pressure, multiplied by one minus the density of the gas referred to air as unity. Applying this rule: The density of hydrogen referred to air as unity is $1 \div 14.418 = 0.06936$. Then, multiplying the weight of one cubic foot of air at the given temperature and pressure by $1 - 0.06936 = 0.93064$, we find for the lifting power of hydrogen at this temperature and pressure, $0.0766 \times 0.93064 = 0.0713$ lb.

(b) No; hydrogen is the lightest gas known.

Wire-Rope Formulas

Referring to the solution of the problem on engine-plane haulage, *Coal Age*, Nov. 13, p. 816, will you kindly explain the method of calculating the size of rope required when hoisting in a shaft or hauling a trip up an engine plane? Is it possible to calculate the diameter of the rope required without referring to wire-rope tables?

In the problem to which I have referred the factor of safety of 5 has been used, and I would like to ask whether this means that the safe working load of the rope is one-fifth of the breaking load or that one-fifth of the breaking load must be subtracted in order to obtain the safe working load of the rope.

D. J. BOWEN.

Lafayette, Colo.

All rope formulas for finding the safe load for any given diameter of rope or the diameter required for any given load are necessarily empirical, being based on actual tests of wire ropes of different kinds and makes. It is impossible to calculate with accuracy the load a wire rope will carry safely for the reason that the strands of the rope and the wires composing the strands are twisted, and the stress in the wires is for the most part not parallel to the axis of the rope.

In the usual makes of rope in this country the wires in a strand form an angle of about 14 deg. with the axis of the strand and the strand makes an angle of 14 deg. with the axis of the rope. Hence, the axial stress in the wire is frequently at an angle of 28 deg. with the axis of the rope. As a result the axial stress permissible in the rope would be equal to the axial stress in the wire at its weakest point multiplied by the cosine of 28 deg. (0.883), which would make the safe load for the rope, say seven-eighths of the safe wire stress calculated for the entire wire cross-section of the rope.

There are, however, other considerations in respect to wire ropes in which the twisted wires are built over a hemp core, which make it impracticable to estimate the strength of the rope except by actual test. The makers of wire rope have made such tests, and the strength of different sizes and kinds of rope is best estimated from the breaking load of a 1-in. rope of the same type.

The following table gives the breaking load of a 1-in. six-strand rope for each kind of wire and style of rope. All ropes used in mining, with few exceptions, have six strands; but haulage ropes, requiring less flexibility and subject to greater wear from exterior abrasion, are generally made of seven wires to the strand, while hoisting ropes, requiring greater flexibility and being less subjected to abrasion, are made of 19 wires to the strand, these wires being of less diameter than those used in haulage ropes:

	Breaking Load of 1-In. Rope (Tons)			
	Iron	Cast Steel	Extra-Strong Cast Steel	Plow Steel
Haulage ropes, 7 wires..	16	32	37	42
Hoisting ropes, 19 wires	17	34	39	44

Two general formulas are used—the first for ascertaining the safe load L for any rope having a diameter d and using any factor of safety f; the second for finding the required diameter d for any safe load L and factor of safety f.

The factor of safety is always the ratio of the breaking load to the estimated safe working load of the rope. Thus when the factor of safety is 5, the estimated safe working load is one-fifth of the breaking load of the rope. The following formulas assume, what is practically true, that the strength of wire rope for the same kind of material and style of rope varies as the square of the diameter of the rope; thus,

$$L = \frac{cd^2}{f} \qquad (1)$$

$$d = \sqrt{\frac{fL}{c}} \qquad (2)$$

In these formulas the load L is in tons, the diameter d in inches, while the rope constant c is taken from the table for the kind and style of rope used. The factor of safety commonly used in mining practice is $f = 5$. However, for hoisting in deep shafts, on steep inclines or when ropes are used under particularly severe conditions of wear or erosion from the acid mine water, a higher factor of safety should be employed.

Examination Questions

Iowa Foremen's Examination, Des Moines, Nov. 9-10, 1915

(Selected Questions)

Ques.—An aircourse in a mine is 5x7 ft. in area and 5,000 ft. long. What horsepower would be required to drive a fan to supply air for 100 men, assuming the air requirement is 100 cu.ft. per man per minute and the fan has an efficiency of 65 per cent. Assume the coefficient of friction $k = 0.000000022$.

Ans.—The volume of air required is $100 \times 100 = 10{,}000$ cu.ft. per min. The sectional area of the airway is $a = 5 \times 7 = 35$ sq.ft., and the rubbing surface $s = 2\,(5 + 7)\,5{,}000 = 120{,}000$ sq.ft. Then, taking the efficiency of the fan as 65 per cent., as stated in the question, the horsepower required to drive the fan is

$$H = \frac{k s Q^3}{0.65 \times 33{,}000\, a^3}$$

$$= \frac{0.000000022 \times 120{,}000 \times 10{,}000^3}{0.65 \times 33{,}000 \times 35^3} = 2.87\, hp.$$

Ques—What advantages has machine mining over shooting off the solid?

Ans.—When mined by machine, a less weight of powder is required to break down the coal than when it is shot off the solid. In the former case the charge of powder is given a better opportunity to perform its work and there is less danger of the occurrence of a blown-out shot. A larger quantity of coal is produced per pound of explosive used. Also a larger percentage of lump is produced by mining the coal.

Ques.—If you were put in charge of a mine that was not properly ventilated although the fan was of ample size to furnish all the air required, what would you do to correct the trouble?

Ans.—First, examine carefully the plan of ventilation and note the course of the air current in its passage throughout the mine. The chief trouble is probably owing to the leakage of air through the stoppings. These should be carefully examined, and air measurements taken in the entry all the way from the foot of the downcast shaft to the last crosscut on each pair of entries or section of the mine. All obstructions should be removed from the airways and crosscuts, and all breakthroughs should be enlarged so that they will have an area at least equal to the sectional area of the airway. Wherever the air current does not sweep the working face, brattices should be built so as to conduct the air forward to the face of the room or the head of the entry. If abandoned places are found to be giving off gas, these should be properly ventilated or sealed off by air-tight stoppings. Wherever practicable, the course of the air current should be shortened and sharp bends and angles in the airway should be avoided.

Ques.—Explain how you would erect a permanent stopping, giving the reason for your selection of the material used in its construction.

Ans.—A permanent stopping should be built of material that will withstand the action of the air current and be sufficiently strong to resist the action of the roof. The choice of material will depend largely on conditions in the mine. Where suitable rock or slate is available, the stopping is often built by erecting a double wall of this material and filling the space between with road dust or other fine material at hand. Where good hard brick can be obtained at a small cost, it is often best to build the stoppings of brick laid in cement mortar. A single wall of brick 18 in. thick when well laid makes a good stopping. In building a stopping, the floor should be cleared so as to provide a level bearing and the ribs should be cut at each side so as to give a good joint. Any loose top should be removed and the stopping carried up to the roof and carefully sealed.

Ques.—If you were put in charge of a small mine and were required to do your own surveying and mapping, explain how you would locate the underground workings with respect to the surface and what system you would employ in putting up sights.

Ans.—The best method to adopt in connecting the underground survey with that on the surface is to use two plumb lines, one in each shaft, connecting these by running a traverse on the surface and underground. If the traverse is properly calculated, it will give the length and direction of the base line joining the two plumb lines, which forms the base line of the survey.

When running the survey underground, an approximate course is determined by observing the needle reading on two or more courses of the survey. The needle bearing is then corrected by the calculated direction of the base line of the survey, and this correction is applied to all the courses of the underground survey.

When it is not practicable to use plumb lines in two separate shafts, the course of the underground survey is found by dropping two plumb lines in the same shaft and determining the direction of the line joining them on the surface, which gives the direction of the same line underground. In the use of this method greater care is required to avoid error, as any slight deviation caused by the swinging of the plumb lines will be greatly exaggerated as the survey is extended in the mine.

Ques.—A fan driven by a steam engine supplies air in a mine through several miles of aircourse. A door is suddenly opened allowing the air to go directly from the air shaft to the escape shaft. Will the opening of this door cause any change in the operation of the fan? Give the reason for your answer.

Ans.—When the air current is short-circuited by the opening of the division door between the main intake and the return airway, the resistance of the mine is cut off, and as a result a larger volume of air at once rushes through the fan. This rush of air causes a greater absorption of work within the fan, and the speed of the fan is reduced, assuming the power applied to the fan shaft remains unchanged.

Coal and Coke News

Washington, D. C.

The opening of Congress has brought with it the usual crop of bills relating to mining of all kinds. Those introduced in the House of Representatives and some of those in the Senate are now available in printed form and include some familiar proposals renewed from past sessions as well as several new ones. Among those now receiving attention are Nos. S. 51, 725, 1772 and H. R. 4669 and 294, providing for the establishment of mining experiment stations at various places, all of which have been referred to the Committees on Mines and Mining. Four bills, H. R. 18, 6043, 5802 and S. 52, call for the creation of a commission to codify and suggest amendments to the general mining laws. Two measures, S. 775 and H. R. 174, relate to mining for radium and its regulation; bills S. 50 and H. R. 671 call for the use of a portion of the proceeds of the sales of public lands to aid the endowment of schools or departments of mines.

Senate bill No. 776 provides for the amendment of the revised statutes so that Sections 2347 and 2348 shall read:

> Section 2347. Every person above the age of 21 years, who is a citizen of the United States, or who has declared his intention to become such, or any corporation organized under the laws of the United States, or of any state, or municipality, or municipal subdivision of any state, shall, upon application to the register of the proper land office, have the right to enter, by legal subdivisions, any quantity of vacant coal lands of the United States not otherwise appropriated or reserved by competent authority, not exceeding 1,280 acres upon payment to the receiver of not less than $10 per acre for such lands, where the same shall be situated more than 15 mi. from any completed railroad and not less than $20 per acre for such lands as shall be within 15 mi. of such road.
>
> Sec. 2348. Any person, or any corporation organized under the laws of the United States, or of any state, or municipality, or municipal subdivision of any state, as above provided, who has opened and improved, or shall hereafter open and improve, any coal mine or mines upon the public lands, and shall be in actual possession of the same, shall be entitled to a preference right of entry under the preceding section, of the mines so opened and improved.

H. R. Bill No. 531 provides for a change in modes of government purchase of coal and reads in part as follows:

> That all wood, coal, oil, gas or other fuel to be purchased and used by any executive department or independent establishment at the seat of government or elsewhere, except necessary emergency purchases in open market, shall be selected, purchased or contracted for in accordance with the recommendations of and under the specifications prepared by the Bureau of Mines.
>
> Section 2. That it shall be the duty of said bureau from time to time to investigate the fuel-burning equipment used by any such department or independent establishment, the methods of purchase and manner of handling, storing and using fuel, and to recommend to such department or independent establishment such changes as will result in the greatest economy to the Government, and to submit a report to Congress, through the Secretary of the Interior, at the beginning of each regular session, setting forth all such recommendations and the results of its operations hereunder.
>
> Sec. 3. That each said department and independent establishment shall, upon request, furnish reports to the Bureau of Mines, in manner and form to be prescribed, relating to fuel consumption, character of fuel-burning equipment, and such other information as may be deemed necessary for the proper and economical selection and use of fuel.

There is as yet no indication of the prospects of these and several other measures, regular and continuous work not having as yet been undertaken by Congress.

HARRISBURG, PENN.

The Reading company and its subsidiaries, comprising the so-called "anthracite coal trust," obtained an appeal on Dec. 18, from Judges Buffington, McPherson and Hunt, in the United States District Court, to the Supreme Court from its decision that certain of the defendants to the action were violating the law.

While the ruling of the court was a victory for the alleged illegal combination, the court found that the business ramifications of the Philadelphia & Reading Coal and Iron Co., the Lehigh & Wilkes-Barre Coal Co. and the Central R.R. of New Jersey were not in accordance with the letter of the law, and ordered the Central company to dispose of its stock in the other concerns. The Government took a general appeal from the entire decision in the anti-trust suit, and the defendants now want the Supreme Court to set aside the finding in so far as it relates to the above concerns.

Insurance Rates Will Probably Be Completed

The State Insurance Fund Board, which has invited representatives of every coal company operating in Pennsylvania to meet its members at the Capitol will probably complete its rates for insurance or coal miners in the state fund within the next week. The officials of the fund have been securing data on accidents in coal mines in this and other states and a number of special investigations have been made with a view of meeting certain phases encountered in some of the larger mines.

The State Compensation authorities have had meetings with representatives of the railroads and the big steel and manufacturing concerns of the state and efforts will be made to secure the hearty coöperation of the coal operators. The State Insurance Fund officials will make efforts to induce some of the coal operators to insure in the state fund instead of carrying their own insurance as the railroads and big steel companies intend to do.

The meeting with the coal operators will bring together men whose operations mean over $100,000,000 in wages and a big effort will be made to win them to the state fund. James W. Leech, chairman of the Compensation Board, and Albert L. Allen, assistant manager of the state fund, will be the speakers, while the counsel for the board will be present.

The rates for insurance in the state fund, which may be made 10 per cent. lower than those of any other insuring agency, are to be issued generally as fast as they can be printed and bound.

The board has formally exempted a number of coal companies from necessity of taking out insurance to cover claims under the provisions of the Compensation Act. All these companies convinced the board of their financial ability to meet any liabilities which might be incurred under the law, the board retaining the privilege of revoking its action at any time.

The coal corporations granted self-insurance are:

United States Steel Corporation (H. C. Frick Coke Co.); W. J. Rainey; Connellsville Coke; Morris Run Coal Mining Co.; Manor Gas Coal Co.; Penn Gas Coal Co.; Westmoreland Coal Co., and the Lehigh & Wilkes-Barre Coal Co.

PENNSYLVANIA

Anthracite

Pittston—The Pittston Mining Institute is this term carrying out a remarkable course of practical demonstrations of the correct and incorrect methods of mining. A series of demonstrations of methods of setting props has been completed and on Monday night the first demonstration of the use of explosives was given. Mine Inspector Samuel J. Jennings, Eighth anthracite district, is conducting the demonstrations and giving the lectures.

In pursuance of its policy to make frequent transfers of officials to acquaint them with conditions existent in different mines, the Pennsylvania Coal Co. is preparing to transfer a number of its mine foremen soon. The list has not yet been completed, Superintendent Jennings stated. Four transfers of colliery superintendents, made Dec. 15, are as follows: John Brown, from No. 14 to No. 6; Benjamin Milton, from No. 6 to Erie; Edgar C. Weichel, from Underwood to No. 14; William Jeffries, from Hoyt colliery to Underwood.

Pottsville—Judge Brum, on Dec. 15, started hearing testimony in the suit of the Home Brewing Co., of Shenandoah, to prevent further undermining of its property by the Thomas Colliery Co. Archbishop Prendergast is also a complainant because the $80,000 church of St. Casimer is threatened. Testimony showed that the Philadelphia & Reading Coal and Iron Co. has also undermined that section.

During a single day recently the Philadelphia & Reading Coal and Iron Co. loaded 1,700 cars of coal, and this number would have been even greater if several collieries had not been shut down for the lack of cars.

Drifton—Erection of a new mine hospital for the Eckley Colliery of the Coxe Brothers & Co., Inc., is now near completion. This mine station for the care of the injured will be fitted up with the latest appliance along this line. The addition to the equipment of the colliery is an excellent one

Lattimer—The fire that broke out in the No. 9 slope of Pardee Bros. & Co. on the night of Dec. 13, has proven more extensive than at first thought, and, on Dec. 18, the Hazleton Fire Department gave the use of firemen's helmets for the men fighting the flames, which are hard to approach. A mine-rescue car is at the colliery and a doctor is on almost constant emergency duty. Twenty-three men were partially overcome on Dec. 17 with gas fumes.

Wilkes-Barre—F. M. Chase, general manager of the Lehigh Valley Coal Co., on Dec. 18, announced plans for the biggest employees' welfare movement ever attempted in the history of anthracite-coal mining. The scope and measure in Mr. Chase's creation are revolutionary in extent and character. It provides for free medical attendance and visits and instructions by professional nurses for 20,000 employees and their families to a total of approximately 100,000 men, women and children. The welfare plan will go into effect on Jan. 1. Its estimated cost is $50,000.

State College—The instruction car of the Bureau of Mines has been here for the past week training the students in the mining-engineering department in rescue work. As a result 19 men have been awarded certificates qualifying them as proficient in mine-rescue and first-aid work. One of the tests to which the men were required to submit themselves was to remain with respirators on in a tunnel filled with poisonous sulphur dioxide gas for over 10 hr.

Shamokin—Finding something wrong with his safety lamp recently, a miner in a colliery of the Susquehanna Coal Co. at this place took it apart and as a consequence the naked flame set fire to a pocket of gas, severely injuring several men.

Shenandoah—All the mines in this region are experiencing difficulty in reaching their maximum capacity in the outturn of tonnage, due to the lack of cars. Recently seven collieries suspended operations for one day from this cause.

Bituminous

Hastings—The Oak Ridge Coal and Coke Co., which lately purchased 1,200 acres of the B, or Miller, vein of coal around its plant here, has already started the sinking of an additional shaft. The coal trade in the northern part of Cambria County has reached such a stage that it is absolutely necessary to open new operations to meet the demand.

Charleroi—One of the largest coal-land deals consummated in western Pennsylvania in many years was recently closed, when the Youghiogheny & Ohio Coal Co. purchased from the Carnegie Coal Co. what is known as the Charleroi plant of the Carnegie company. The purchase price was $1,400,000. The property is situated along the Monongahela River, and consists of 1,100 acres. The Youghiogheny company is one of the largest coal companies in the Pittsburgh district, with extensive holdings in Washington, Green and Westmoreland counties. It also operates in Ohio.

Pittsburgh—Rains in the upper valleys and melting snow has begun to swell the Ohio to a shipping stage, and coal shippers are preparing to take advantage of the expected rise. Coal will be shipped to Louisville and New Orleans to an anticipated total of more than a million bushels provided that the coal shipping stage materializes.

New Carrolltown—The Watkins Coal Co. has completed the installation of a new coal conveyor at its operation between Bakerton and Spangler. This conveyor obviates the dumping of coal by hand and will increase the output of the mine from 100 to 200 tons.

Jeanette—The first train, four cars of coal, from the Delmont Gas Coal Co., was recently hauled over the Delmont spur of the Turtle Creek branch of the Pennsylvania R.R. This new branch of the Turtle Creek road runs within ½ mi. of Delmont into territory operated by the Delmont company and the New York and Cleveland Coal Co.

Uniontown—Dr. S. B. Hess and S. A. Carson were recently appointed receivers for the Harris-Smith Coal and Coke Co. The receivership was granted on the petition of the Browning Coke Co. and Lloyd H. Smith to cover an indebtedness of $30,000, representing a mortgage of the corporation in Franklin Township of Fayette County. The unsecured debtedness is $44,500 and the assets are $3,988.

Connellsville—The production of coke for the Connellsville region recently amounted to somewhat over 450,000 tons per week, being a gain of almost 15,000 tons over the preceding week. Shipments for the week were about 700 tons less than the production.

WEST VIRGINIA

Huntington—Officers of the Raleigh Coal and Coke Co. recently dedicated a handsome new theater building to their employees at Raleigh. This theater was recently completed at a cost of $20,000 and will be used entirely for the benefit and amusement of the company's employees.

Fairmont—Work was recently begun by John M. Kisner & Bro. on the construction of an engine and boiler house and supply house for the Consolidation Coal Co. at its Ida May mine in the Helen's Run field. This engine and boiler house will be 40x90 ft. in dimensions and will be strictly fireproof, while the supply house will be of wood 14x40 ft. with a large loading platform on each side.

Clarksburg—Coal operators who met recently with A. W. Thompson, vice-president of the Baltimore & Ohio R.R., received little encouragement from that official in regard to the car supply. He stated that the company is manufacturing about 100 new cars per day, but this so far has served but little to relieve the shortage.

Charleston—By providing compensation in the cases of families of two of the victims of the Boomer mine disaster within 17 days after the occurrence of the fatalities, the Workmen's Compensation Department recently established a record. The families of the other 21 victims of the explosion will be cared for as rapidly as possible.

Cautionary notices accompanied by a list of the employees killed in the mines of the state during the month of November and the immediate and contributing causes, are included in data being mailed out by Chief Henry of the Department of Mines to every section of the state. Mr. Henry's circular letter calls attention to the accidents during the month of November, when 23 men lost their lives through falls of slate or coal. These, Mr. Henry believes, could have been reduced in number by the exercise of more care by the men and the mine bosses.

KENTUCKY

Lexington—Twenty-nine foremen were given certificates, 19 first-class, 8 second-class and 2 third-class, as a result of the examination recently conducted here at the School of Mines and Metallurgy.

Louisville—The finished draft of the proposed Workmen's Compensation law was considered by the executive committee of the Kentucky Mine Owners' Association at a recent meeting in Louisville, at which it was proposed to call a meeting of the association for the first week in January for further consideration of this and other matters. Members of the Executive Committee generally approve the law which was in part a work of Kenneth U. Meguire, president of the Harlan Coal Co., and C. W. Taylor, of Greenville, who represented the coal interests on the commission. Eight members of the executive committee were in attendance.

OHIO

Columbus—In his campaign to prevent many of the mining accidents in Ohio, J. M. Roan, Chief Deputy and Safety Commissioner of Mines, has issued a pamphlet printed in all languages spoken by Ohio miners, containing excerpts of the mining laws of the state. Stress is being placed on the enforcement of discipline in and about the mines by the mine management. It is the opinion of Mr. Roan that practically every fatal accident could be prevented by the proper obedience to the mine laws.

ILLINOIS

Duquoin—Work is expected to begin in the early spring on the electric line that is to belt the coal districts of Franklin and Williamson counties, in southern Illinois. The proposed line will connect Marion, Johnston City and Herrin in Williamson County with Benton in Franklin County and Harrisburg in Saline County. The enterprise is controlled by the Schott interests of New York, who now have a line in operation between Eldorado and Harrisburg.

Edwardsville—One of the largest personal injury verdicts recorded in years was recently returned by a jury in the Circuit Court here against the Madison Coal Corporation of St. Louis. The judgment is for $15,000, in favor of John Wendzenski, of Glen Carbon, for the loss of his eyes by a premature explosion in the company's No. 2 mine, at Glen Carbon, in October, 1913. Attorneys for the company filed a motion for a new trial.

IOWA

Des Moines—There is a prospect of a new coal field being opened in 1916 in Hardin County. Coal beds of good thickness have been located and a company with ample capital is investigating the field.

Prospectors are at work on the Henry Carlock farm in Indian Creek Township in the hope of locating a vein of coal thick enough to warrant mining. Former prospects showed a good coal bed in that section, but it is not certain the roof is thick enough to withstand propping.

Mine No. 10 of the Phillips Coal Co., in Dallas County which was closed on order of the state mine examiner, is still idle. The company had tunneled under the river to tap a coal field on the other side. The examiner demanded that the operations cease until a new escape shaft was provided on the other side of the stream. The company has not yet complied.

COLORADO

Denver—The state coal-mine inspector reports that not a single fatal accident occurred during November in a Colorado coal mine, this being the first instance of the kind in 17 years. It is attributed to the enforcement of stringent "safety-first" rules and the employers' liability law.

WASHINGTON

Zillah—Two bodies of anthracite coal were discovered recently on the farm of W. M. Ludvig while he was drilling for a well. The first coal bed is 8 ft. thick, under which was found 7 ft. of blue slate clay which separated the two beds of coal. The second measure is 4½ ft. thick. The Northern Pacific R.R. Co. is making an analysis.

Seattle—As a result of the recent accident at the Ravensdale mine, owned by the Northwestern Improvement Co., a subsidiary of the Northern Pacific Ry. Co., in which 31 men were killed by an explosion of coal gas, officials of the company have announced that the ill-fated property will be abandoned. The announcement was made after it had been determined that the mine timbering and machinery had been so wrecked by the explosion and the mine made so generally unsafe that it would cost more to repair the damage than it would to open a new mine. The company has other coal lands in the same section and will start development work at once.

PERSONALS

John S. Healy, former general manager of the Davis Coal and Coke Co., has accepted a position with the Chesapeake & Ohio R.R. Co.

R. P. Curry, who has been a traveling salesman in eastern Kentucky for 26 years, has taken the management of the commissary of the Hazard Coal Co., at Hazard, Ky.

George M. Crokey, of Toledo, Ohio, has been appointed receiver of the Indian Guayan Coal Co., which operates mines in Gallia County, Ohio. The property was ordered sold on Dec. 22.

Oliver H. Hughes, a member of the Ohio Public Utilities Commission, retired recently because of the expiration of his term. Several prominent men are mentioned for the position.

E. A. Purkey, superintendent of the Antler Coal Co.'s mine at Round Bottom, has resigned to take charge of a mine for the Tyrconnell company at Rosemont. He will be succeeded as superintendent at Round Bottom by Bob Pollock.

The Bureau of Mines has appointed Dr. A. F. Knoefel, of Terre Haute, Ind., in charge of the first-aid work of the Indiana bituminous-coal operators' association, as a member of an advisory committee to aid in standardizing first-aid work throughout the country.

Peter McGovern, mine foreman at Warrior Run Colliery, of the Lehigh Valley Coal Co., has resigned, following his appointment as an inspector with the Associated Companies of Workmen's Compensation Insurance. His new position will require him to travel over a large territory inspecting working conditions and safety appliances.

Thomas Madden, a fireboss in No. 9 colliery of the Pennsylvania Coal Co., for an act of heroism performed three years ago, recently received a check for $1,000 from the Carnegie Hero Fund. Mr. Madden, while a fireboss in No. 14 colliery, made his way to a number of men who were overcome by blackdamp following an explosion. He made two trips to the dangerous workings. A short time after the explosion he received a Carnegie Hero medal.

OBITUARY

Col. Michael P. Gannon, aged 72 years, recently died at Westernport, Md. Colonel Gannon was extensively interested in the mining of coal in Maryland and West Virginia, and was also connected with several banking institutions in an official capacity.

Frank Howard Bailie, for 27 years assistant manager of sales for the H. K. Porter Co., died recently after a brief illness from pneumonia. He will be greatly missed by his past employers, and many correspondents who have been his personal friends.

Abraham Overholt Tinstman, one of the oldest coke manufacturers in Pennsylvania died of pneumonia recently at his home in Turtle Creek. Mr. Tinstman was born in East Huntington Township, Westmoreland County in 1834. In 1865 he, with Joseph Rist, purchased 600 acres of coal land in the Connellsville coke region and a short time later, they, together with A. S. M. Morgan, organized the firm of Morgan & Co., erecting 111 ovens at Morgan Mills in Fayette County. In 1870 Mr. Tinstman organized the Mt. Pleasant & Broadford R.R. Co. In 1871, H. C. Frick was engaged by Mr. Tinstman's grandfather, A. Overholt, at Broadford as a bookkeeper. His business ability, however, caused Mr. Tinstman and his partner Mr. Rist to take him into their business. Mr. Tinstman and his partner later organized the Frick Coal and Coke Co., Mr. Frick holding some stock. The company purchased 200 ovens at Broadford and 100 at Mt. Pleasant. In 1873, Mr. Tinstman met with financial difficulties and in 1876 lost everything. Within a year, however, he had obtained an option on 3,500 acres of coal land in the Connellsville district and sold the land at a large profit. He then organized the Connellsville Coal and Iron Co., and in 1880 established the A. O. Tinstman Co., of Pittsburgh. In 1881, he purchased the Mt. Braddock Coke Co. and the Pennsville Coke Co. A few years later he sold all his holdings and engaged in buying and selling coal lands until recently when he retired.

INDUSTRIAL NEWS

War, W. Va.—The Elkhorn Coal and Coke Co. will shortly install an electric plant at its coal mine to cost about $8,000.

Pittsburgh, Penn.—The Concordia Safety Lamp Co., Inc., has recently moved its office to the Fulton Bldg. in Pittsburgh.

Gary, W. Va.—The United States Coal and Coke Co. recently fired up 1,700 ovens, and is now calling for 1,000 men for work on the coke yards and in the mines.

Des Moines, Iowa—Operators report to the state department they are not hampered to any extent by car shortage and have been doing a fine business this fall.

Huntington, W. Va.—It is reported here that a new coal mine will shortly be opened at Glenhayes, Wayne County. It is thought that extensive operations will be begun shortly in that neighborhood.

Fargo, N. D.—The Standard Coal Co., of Beulah, Mercer Co., was recently incorporated with a capital stock of $25,600. The incorporators are George G. Schmidt, Marguerita Schmidt and Phillip Schmidt, all of Beulah.

Hamilton, Ohio—It is stated that the Hamilton Otto Coke Co. with a plant at Cokotto is planning to erect an addition at a cost of $80,000 for the extraction of various by-products, chief among which are light oils.

Indianapolis, Ind.—The Robinson Mining Machine Co. has been organized at Indianapolis with $10,000 capital stock. It will manufacture mining machines. The directors are Lige Robinson, Oliver Williamson, E. M. Shorter.

Beckley, W. Va.—The Prince-Wick Coal Co. has been incorporated here with a capital stock of $100,000, by Prince E. Lilly, Thomas H. Wickham and others. The company has interests in this vicinity, and proposes to open up several mines this spring.

Norfolk, Va.—In October the Chesapeake & Ohio Ry carried 2,176,990 tons of coal, being an increase of 149,112 over the same month of 1914. For the four months ending with October, the road showed an increase of 649,326, or a total coal tonnage of 9,636,309.

Lansford, Penn.—It is the intention of the Lehigh Coal and Navigation Co. to introduce electricity into all its workings in the Panther Creek Valley, both for power and lighting. The equipment is now being arranged for and the power will be supplied from the extensive plant at Hauto.

Grafton, W. Va.—A new electric haulage system will be installed in the T. B. Davis mine at Flemington, recently purchased by Clarence D. Robinson, of Fairmont. This mine has had a capacity of 500 tons daily but it is expected that this will be doubled when improvements are completed.

Washington, D. C.—Ten railroads operating in Pittsburgh territory have filed tariffs with the Interstate Commerce Commission proposing increases in freight rates on bituminous coal from Pittsburgh to points in the Middle West. Increases would become effective Jan. 20, if allowed.

Bluefield, W. Va.—A total of 2,698,706 net tons of coal were carried over the Norfolk & Western R.R. during the month of November, this being a decrease of 328,350 tons as compared with the 3,027,236 tons for October of this year, and an increase of 854,949 tons as compared with November of last year.

Camden, Mo.—A charter has been issued by the secretary of state, to the Riverside Coal and Mining Co., of Camden, Ray County, Mo. The capital stock is $2,880, one-half paid. The incorporators are J. S. Finley, William Parr and B. B. King. The company has been organized to mine and market coal.

Columbus, Ohio—It is reported that less than 3,000 coal miners in Ohio are now out of work as against 20,000 a year ago. Between 43,000 and 44,000 are now working and business is rapidly improving. The few thousands of men who are now unemployed are receiving strike benefits.

Kansas City, Mo.—Recent rains at Abilene, Kan., washed out a deep ditch and uncovered a bed of coal on the farm of R. M. White, 25 mi. south of Abilene. The deposit is apparently of good quality and is several feet thick. Specimens have been sent to the state university at Lawrence for analysis.

Moundsville, W. Va.—The Fort Pitt Coal Co.'s mine, situated across the river in Ohio, will be sold to satisfy creditors on Jan. 6. The sale will be in charge of trustee W. E. Thomas, of Bridgeport. One fourth of the purchase price must be paid in cash and the balance as soon as the sale is confirmed.

Wheeling, W. Va.—Following advances in the price of coal both East and West, it was recently announced that the quotations of run of mine coal in the Fairmont-Clarksburg field have been advanced to $1.75 and $2 per ton. Owing to a shortage, the mines are running only about 85 per cent. of their capacity.

Clarksburg, W. Va.—It is stated that not only will the coal interests in the State of West Virginia fight against any increase in the rates on coal to the West, the tariffs of which were recently filed, but that the State Service Commission and the operators would ask that the Interstate Commerce Commission investigate the rates to the East.

Petros, Tenn.—The mine and property of the Big Brushy Coal Co., which was placed in a receiver's hands a short time ago, was advertised to be sold at public sale, by Charles H. Davis, at the Company's commissary at Petros, Morgan County, Tenn., on Dec. 18, 1915, at 12 o'clock noon, subject to a $5,000 mortgage maturing in 1929.

Charleston, W. Va.—A charter was recently issued to the Pilgrim Coal Co., of Uniontown, Penn., for the purpose of operating coal mines in Ohio County, W. Va. The authorized capital of this firm is $5,000 and the incorporators are Harold Robinson, Allen B. Williams, Elizabeth M. Leonard, Donna B. Van Gilder and Abbey L. Culp, all of Uniontown.

Wheeling, W. Va.—There are many rumors afloat regarding the proposed power plant and other improvements at Beech Bottom, but it appears reasonably certain that some big expenditures are projected. It appears to be the intention to use the coal at the mine to generate power that can be transmitted to all the surrounding mines and towns.

Scranton, Penn.—Disturbances in the workings of the surface vein of the National Mine of the Lackawanna company recently caused Beech St. in South Scranton to settle more than 2 ft. Four dwellings were considerably damaged. The affected area is confined to the 700 block, and is adjacent to the other section which suffered considerably during the past few weeks.

Denver, Colo.—The Crown Tar Works of the Denver Gas and Electric Light Co. has closed a contract with the Nitro Powder Co., Kingston, N. Y., for some 25,000 gal. of naphthalene, to be delivered before Jan. 1. It is a novelty for the West to be supplying the East with this sort of material and is a direct result of the European war, which has curtailed the importations from Germany.

Martinsburg, W. Va.—William T. Coale, general manager of the Georges Creek Coal Co., as receiver for the Franklin Coal Co. of Westernport, recently sold for $11,000 the mining outfit of the latter firm, including a number of houses, mine cars, rails, tipples and other property, to the M. J. Miller's Sons of Westernport. The mines will be operated by John J. Miller and J. O. J. Greene.

Philadelphia, Penn.—Vessel freights to coastwise points, especially New England, have almost reached a record point. This has resulted in increasing the demand for coal all-rail from this territory. Recently a rate as high as $3 per ton from Virginia to Maine was paid, which is the highest known for over fifty years. During the anthracite strikes of 13 years ago the rate reached $2.50 per ton.

St. Marys, Ohio—A 3,000-ton coal heap on fire from spontaneous combustion for the past six weeks was cleaned up a few days ago at the generating plant of the Western Ohio Electric Co. A new fire from the same cause has now broken out in a 5,000-ton heap at the same place. The coal in the smaller fire was found mostly "coked," and not much damaged otherwise after the fire.

St. Louis, Mo.—T. T. Stevenson has closed a conditional deal with a New York syndicate for the sale of 22,000 acres of coal land in Meridian, Brookside, Clement and East Fork Townships, Clinton County, Ill., and papers were recently signed. If tests develop satisfactory beds of coal, the owners will receive $15 per acre, or $330,000. The logs of wells drilled for oil in that territory show good beds, and it is claimed that several mines will be sunk.

Clarksburg, W. Va.—Owing to a sudden and unexpected shortage in the natural-gas supply, which caused the West Virginia Public Service Commission to order the Clarksburg Light and Heat Co. to take steps to relieve the situation for the benefit of domestic consumers, the supply of gas has been withdrawn from nearly 100 industrial concerns using it for fuel. This has caused the temporary shut-down, in whole or in part, of many of these concerns, which have heretofore been able to use gas without limit.

Toledo, Ohio—The Toledo Coal Sales Co., has been incorporated for $10,000 and will continue business at 724 Spitzer building as it has been doing for some time past. There will be no change in the management. The general manager of the concern is D. B. Frisbee and the company handles the output of the "Southern Gem" mine in Kentucky and the "Tug Mountain" mine in West Virginia white ash territory. The incorporation was made to make possible the expansion of the business which has been rapidly growing.

Fairmont, W. Va.—A coal famine, due to a shortage of cars, is anticipated. The Philadelphia & Reading R.R. Co. has called in all its cars from the lines of the Baltimore & Ohio and Western Maryland for the purpose of loading them with anthracite coal and stocking for the future. It is said that car shortages have occurred from time to time but there has never been such a shortage as at present and the reason is traceable to prosperity. Every coal operator is clamoring for cars to fill his orders but he is getting only a few.

Central City, Ky.—Extension of the Kentucky Midland R.R. from its terminus in Muhlenberg County to Dawson Springs via Earlington, is reported to be projected. The road was built three years ago from Central City to Summers, a distance of 12 mi. and now handles the output of the big mines at Summers, via Central City. The distance to Dawson Springs, as the road is projected, is 22 mi. and the line would touch rich coal fields between Earlington and Dawson, now undeveloped. The original construction was standard in all respects.

St. Louis, Mo.—The Misosuri Bureau of Labor Statistics reports the states' production of bituminous coal for the year 1914, as 3,935,980 net tons, with a value of $6,802,325, a decrease of 382,165 or 0.85 per cent. under 1913. Macon County led with 765,703 net tons. For the state as a whole, the coal had an average value of $1.73 per net ton. Nine thousand five hundred and forty-nine miners were employed an average of 179 days. Fatal accidents numbered 19. At the present rate of consumption it is figured Missouri coal deposits are ample enough to last 9,000 years.

St. Louis, Mo.—Officials of railroads operating eastward from Chicago and St. Louis report a volume of freight moving toward the Atlantic seaboard, which is taxing their facilities to the limit. This situation has prevailed for the last two or three weeks, and has resulted in embargoes being placed at many of the terminal points and results in an abnormal situation with regard to the movement of east-bound freight. Officials of Southern lines report tonnage as holding steady at the advances established a fortnight ago. Business throughout the South is steadily improving.

Seattle, Wash.—The Port of Seattle is now considering the erection of a colliery for the benefit of boats on the Sound. After waiting five months for the Port Commission to offer terms for a lease of part of their holdings at Smiths Cove, the United Coal Sales Company has leased a site in West Seattle and will at once erect bunkers, and other facilities. The company asked the commission for a lease in July and renewed its efforts in November. It will prepare to take care of vessels which now have to load from barges alongside or go to British Columbia or Tacoma to coal.

Coal Trade Reviews

General Review

Anthracite supplies short with no indications of any relief in sight. Runaway market on bituminous. Further tightening of railroad congestion will create panic conditions. Some consumers hard pressed to keep their plants going. Middle Western roads stocking heavily but the market is not so tight.

Anthracite—Supplies of hard coal at distributing centers are reduced to a point where daily arrivals are going into immediate consumption, and energetic measures are occasionally necessary to keep consumers from running short. All attention at the moment is concentrated on getting tonnage forward with the utmost dispatch. The railroad congestion is more acute, if anything, and the inadequate car supply has seriously interrupted operations in the mining regions, still further restricting the available tonnage. Buyers are aggressively seeking odd tonnages to fill out their requirements, and it is developing that substantial premiums above contract quotations are occasionally being paid on the steam grades. Some of the railroads have already begun to confiscate coal en route.

Bituminous—The spectacular advance of the past week has caught producing interests, distributors and consumers alike unprepared and the market is beyond control. Speculation is rife, brokers turning over tonnage daily at unprecedented profits, and this condition will persist until the carriers solve the transportation riddle. The abundant supplies at Hampton Roads is the only factor restraining the speculative element from forcing prices up to a panic level.

In spite of the fact that all available vessel tonnage has been pressed into service, arrivals are still inadequate so that shippers are holding customers down to the very smallest tonnage they can keep going on and it is probable that some curtailment may result unless the transportation companies succeed in getting coal forward more promptly. It is practically a runaway market, exaggerated predictions concerning prices made a month or six weeks ago having been more than realized. Quotations are fluctuating in a spectacular manner over a wide range.

Exports—The sharp flurry and anxiety regarding supplies in the domestic market have dispelled all interest in the offshore business. While vessel rates have apparently not increased any further, tonnage is more difficult to obtain, and practically everything in the Coastwise market has been covered. Dumpings over the Hampton Roads pier show some improvement, though they are still substantially below the previous high level.

Ohio Valley—Demand on contracts continue very heavy, with the result that there is little free coal to be picked up in the prompt market. The inquiries which developed from the Seaboard last week have apparently not materialized into actual business, though the regular line demand is stronger and prices stiffer. The warmer weather caused a temporary reaction, but none of serious proportions, dealers seizing upon the opportunity to accumulate as large stocks as possible. The steam demand continues particularly strong; there have been plentiful supplies of this grade so far, but it is reported that some consumers have been encountering difficulty in getting sufficient tonnage to keep going. The heavy rains have interfered with transportation in some quarters.

Middle West—The lowest temperatures of the season, supplemented by the constantly expanding demand from industrial quarters and extra orders from the railroads for stocking purposes, has increased the working schedules and strengthened the market still further. Anything on the order of concessions from list prices has been eliminated and the market is firm all along the line. Transportation is fairly good; no serious difficulties have yet been experienced in this direction but it is felt that the general congestion prevailing throughout the East may spread to this section. Weather conditions in the Northwest have not been so favorable to an active consumption, and the movement out from the upper ports has been relatively light.

A Year Ago—Anthracite consumers becoming urgent about prompt deliveries. Bituminous quiet with sellers concerned mostly about new contracts. Effects of the customary year end curtailment already being felt but colder weather stimulates the domestic trade.

BUSINESS OPINIONS

Iron Age—The embargo laid by all railroads on shipments of iron and steel products to New York for export, while it throws some serious problems on the mills, is a blessing to domestic consumers. While exports of steel have been declining since August, largely because of transportation difficulties, they have amounted to enough to bring measurable relief if diverted into home channels. There is more pressure from consumers to get places on the steel companies' order books for deliveries after July 1, 1916, and the amount of such business taken is increasing, though some mills still insist they are not ready to sell for the second half. The calculations of important manufacturers who work up iron and steel are more and more based on the projection of record consumption and high prices far into next year.

Philadelphia News Bureau—With the closing of the year the conditions are very promising. There is naturally much depression over the European outlook, but so far as the domestic situation is concerned there is every reason for confidence. A very encouraging feature is the remarkable Christmas trade, which is not confined to any one section, but is general over the whole country. People have made big money and they are spending it. When the year-end statistics are published much surprise will be expressed at the position of the United States. It is idle to say that we have discounted all the goods that are coming to us.

Dun—Temporary restriction of operations resulted from the storm, which for a time hampered wire and transportation service and aggravated the congestion of freight. Needed deliveries were further retarded and the strength of certain commodities accentuated, while outdoor work in the East and Great Lakes region was partially suspended. Considerable benefit, however, accrued from the snowfall and lower temperatures, additional stimulus being imparted to the distribution of heavyweight apparel, footwear and fuel. Commercial failures this week, are 381, against 372 last week, 361 the preceding week and 449 the corresponding week last year.

Bradstreet—Sustained activity in a majority of lines, with prospects of still greater growth, typify current trade and industrial conditions. Contrary to precedent, the larger trades do not display the customary pre-holiday characteristics that usually prevail when the time for the taking of inventories arrives. True, there has been a lull in some sections, but by and large activity is so steadily maintained that salesmen are remaining on the road longer than usual at this season, and most reports agree that wholesale, as well as jobbing trade is of large volume.

Winter Wheat Condition—The government report on winter-wheat condition, shows a total area sown this fall of 37,256,000 acres, a decrease of 3,197,000, or 8%, from the area harvested this year, with a condition on Dec. 1 of 87.7, as against 88.3 last year, and a ten-year average of 90.8. The condition shown is the lowest since 1911.

Marshall Field & Co.—Current wholesale distribution of dry goods is far in excess of the corresponding period of a year ago. Seasonable weather, together with the record breaking holiday business that retailers all over the country are doing, is largely responsible for this increase. Road sales for both immediate and spring delivery continue to be larger than the corresponding period for the past few years, and the customers have been in the market in greater numbers. Collections are satisfactory and prices firm.

The Southern Lumberman, though winter weather has now come in earnest, the resulting contraction of building operations has so far in no respect weakened the strong yellow-pine market. The actual volume of business moving is somewhat less this week, and has, in fact, shown gradual decrease for the past three weeks, but production at the mills has been kept at its proper level and the market has continued to rise accordingly. Even more uniformly optimistic reports are being received than have characterized the hardwood market during recent weeks.

ATLANTIC SEABOARD

BOSTON

Hampton Roads accumulations likely to be reduced by car and labor shortage. Situation grows more acute from day to day. Georges Creek shipments light and Pennsylvania grades active at new high levels. Water freights nominal with no tonnage to be had. Anthracite shippers getting farther behind.

Bituminous—The situation in New England gets increasingly grave. Hampton Roads is still the one place where there is a surplus of coal and prices have not changed but it is very likely that the holiday period there will show a marked change. Already a scarcity of cars is noted on certain of the Virginia railroads, particularly those with western connections, and if loaded cars are not released at the piers it will mean a reduced output. The Christmas season is another factor that will tend to reduce accumulations at Hampton Roads. Should steamers and barges be obliged to wait for coal it will mean such a falling-off in the only dependable source of supply for this territory that the market will be in very serious straights.

It is reported $7 has been paid for Pocahontas and New River on cars Providence, and apparently there is nothing to prevent a spectacular advance. Shippers are holding their customers down to actual week to week consumption in many cases and most strenuous efforts are being made to keep plants running.

Georges Creek has shortened up materially in supply at all the loading ports, and deliveries at this end are much hampered by slow movement along the coast. Car supply at the mines is rapidly getting worse and shipments to this territory are likely to be few and far between by Jan. 1. That some of the transportation ordinarily carrying Georges Creek has been loading at Hampton Roads this week is a significant development.

The Pennsylvania grades continue active, although the buying of spot lots is rather spasmodic. Cambrias and Somersets meet with ready sale at prices up to $3.25 f.o.b. mines, while good Clearfields are only 25c. less. The higher volatile coals from Clarion, Indiana, and Armstrong counties have already entered the market, although the freight differential against some of them causes a much lower price at the mines. For this grade as high as $2.50, however, has been paid during the week. There is a good deal of tempering of the market and everybody has coal for sale but actual sales so far are not very heavy.

Water Freights—The only reason that rates are not in excess of $3, Hampton Roads to Boston, is that there are practically no bottoms open to charter that can load under 30 days. Several charters have been made for a series of trips at current rates and the prospect is by no means clear. The situation on small boats for New York loading to points like Providence has not eased up in the least; $1.25 has been paid for trips through March and April.

Anthracite—Shipments are extremely slow, and certainly a bad situation is facing Tidewater New England. An embargo against deliveries all-rail to points on the New Haven R.R. only emphasizes the congestion that prevails on most of the lines. Many of the collieries are on half-time. Certain kinds and sizes of hard coal are also in scant supply and most of the dealers are alarmed over the outlook. Dec. 15 the Boston retailers advanced stove and egg coal to $8 and chestnut to $8,25 per net ton delivered.

Bituminous quotations, f.o.b. loading port at points designated, are about as follows per gross ton:

	Philadelphia	New York	Baltimore	F.o.b. Mine
Clearfields	$3.50@4.25	$3.80@4.55	....	$2.25@3.00
Cambrias and Somersets	3.75@4.50	4.05@4.80	....	2.50@3.25
Georges Creek	....	....	....	....

Pocahontas and New River are still quoted $2.80@2.85 f.o.b. Norfolk and Newport News. On cars at Boston prices are $6.50@6.75, and $6.75@7 at Providence.

NEW YORK

Car shortage affecting anthracite market. Some labor troubles on docks. Steam sizes stiffen. Bituminous prices advance. Some manufacturers may run short.

Anthracite—Lack of supply, due to the freight congestion and an increased consumption have caused a tightening of the hard coal situation at Tidewater. In addition to car troubles some shippers are having labor disturbances among the stevedores and coal handlers but this difficulty promises to be settled shortly.

Shippers have had to exert their best efforts to meet orders. The strong situation is reflected in the opening of bids early this week for supplying city departments with 18,000 tons of buckwheat coal and about 250 tons of egg, there being only one bid on each contract; under ordinary conditions there would have been at least a dozen bidders on each item. Boats continue scarce and freight rates remain around the 35c. mark. Prepared coals are commanding full circular and there are reports of premiums for stove and nut sizes. Line demand for the larger sizes is active. High grade steam coals are practically out of the running. Pea coal is quoted at $3.50 and better. Fair grades of buckwheat are commanding from 10 to 20c. above regular price and barley is quoted at $2.25 f.o.b.

Current quotations, gross tons, f.o.b. follow:

	Lower Ports		Upper Ports	
	Circular	Individual	Circular	Individual
Broken	$5.05		$5.10	
Egg	5.30	$5.30@5.30	5.35	$5.35@5.35
Stove	5.30	5.30@5.30	5.35	5.35@5.35
Chestnut	5.55	5.55@5.55	5.60	5.55@5.60
Pea	3.50	3.45@3.50	3.55	3.50@3.55
Buckwheat	2.75	2.45@2.75	2.80	2.45@2.80
Rice	2.25	1.95@2.25	2.30	2.00@2.30
Barley	1.75	1.50@1.75	1.80	1.75@1.80

Bituminous—Failure to get shipments forward and a heavier demand have resulted in further price increases at Tidewater though line prices are a trifle softer. However, some shippers believe the situation is easier but see no hope for much improvement unless the freight congestion improves. During the week hardly any grades of coal could be obtained at less than $4 f.o.b. while most quotations were from $4.25 to $4.50 and higher according to quality. There is practically no coal at Tidewater docks owing to the failure of the transportation companies to get shipments forward. Agencies find it impossible to make any promises as to when they can fill orders. Many boats continue to be held at the docks.

Wholesale houses are unwilling to take on any more contracts, on Monday of this week there was but one bidder on a contract for 5,000 gross tons of bituminous slack for one of the city departments. Contractors are becoming anxious and there are reports that some large manufacturers have said that unless they can secure better deliveries it will be necessary to partially suspend operations at their plants. There is very little free coal to be had; quotations range from $4.25 to $4.50, and as there are plenty of buyers, there is little dickering over prices. Slack is quoted at $1.75 at the mines.

Current quotations, gross tons, f.o.b. Tidewater follow:

	South Amboy	Port Reading	St. George	Mine Price
Georges Creek Big Vein	$4.30@4.55	$4.30@4.55	$4.30@4.35	$2.75@3.00

PHILADELPHIA

Anthracite is extremely brisk with chestnut, buckwheat, and rice the leaders. Car supply outlook serious, with many collieries shut down. Bituminous prices touch the $3 mark, and are advancing almost daily.

Anthracite—Sales agencies have abandoned seeking orders, and are now concentrating their efforts on following up shipments, and rushing the coal forward with the utmost dispatch. Orders are plentiful on practically all sizes, and it is impossible to satisfy the demand. With such active conditions at this time, there is a great deal of concern felt over what the situation will be later. The car supply question continues the chief cause for anxiety, the situation in this respect becoming more acute as the season advances. Production is being severely restricted from this cause, one of the leading anthracite companies having been reduced to half-time working schedule during the past week. Sizes that could not be moved, except at the severest kind of a sacrifice a month ago, are now in active demand, some of them bringing substantial premiums.

The purchasing agents for the large consumers are combing the market for coal, and it has developed that a number of large buyers are paying premiums on buckwheat and rice coal. This is particularly the case with bituminous consumers, who are attempting to supplement their requirements with anthracite coal. A gratifying feature of the situation is the fact that domestic consumers have not yet taken alarm over the situation; the demand from this source continues only on about a normal basis for this season, but even this is sufficient to absorb all the arrivals, and any heavy buying movement would precipitate a runaway market.

The demand for broken shows no abatement. The output could probably be sold at full circular, $3.50 and tax, but the contracts prevent this, as practically all this size is sold that way. Gas companies and iron foundries, which are the principal consumers are endeavoring to stock heavily. Egg is still the weakest size and the companies find it difficult to move at $3.75 and tax, while the individuals show an inclination to shade the price to the extent of 10 or 15c. by omitting the tax. Stove coal is all sold at $4.10 and tax and shippers are unable to supply the demand for this popular size. Chestnut has been the real leader this week, quite a few dealers allowed their stocks of this grade to run down to make room for pea at $2 and tax and they are now suddenly confronted with a great shortage. If the large dealers decide to draw on their storage piles for the prepared sizes, it will relieve the situation provided the inadequate car supply does not interfere.

The rumor of a new price circular at the first of the year grows in strength and it is altogether likely that there will be material changes in all sizes at that time.

The prices per gross ton at mines for line shipment and f.o.b. Port Richmond are as follows:

	Line	Tide		Line	Tide
Broken	$3.50	$4.75	Pea	$2.50	$3.25
Egg	3.75	5.00	Buckwheat	1.50	2.25
Stove	4.00	5.00	Rice	.85	1.75
Chestnut	4.15	5.25	Barley	.50	1.50

Bituminous—Six weeks ago predictions of even $2 coal before Jan. 1 were scoffed, yet that price was reached two weeks ago and we now have $3 coal. Of course this is not on all grades, but numerous sales have been reported at from $2.75 to $3 for coal that a few months ago was considered only ordinary. Price changes have been so rapid that no one cares to venture a prediction. The past week witnessed the biggest advances so far this season, ranging from 70c. down to 25c. or a general average of about 30c. The car supply continues inadequate, with most shippers claiming to receive only 20% to 30% of their requirements.

Prices per gross ton, f.o.b. cars at mines, are about as follows:

Georges Creek Big Vein	$2.75@3.00	Fairmont gas, ¾	$1.90@2.00
South Fork Miller Vein	2.70@2.75	Fairmont gas, mine-run	1.75@1.85
Clearfield (ordinary)	2.50@2.75	Fairmont gas, slack	1.60@1.75
Somerset (ordinary)	2.50@2.75	Fairmont lump, ordinary	1.70@1.80
West Va. Freeport	2.50@2.60	Fairmont mine-run	1.65@1.70
		Fairmont slack	1.60@1.75

BALTIMORE

Trade dominated by many unusual conditions. Low-grade fuels advance rapidly. Hampton Roads coals coming in all-rail.

The trade is dominated by railroad embargoes on general freight, car shortage and excessive vessel freights in such a way that the most unusual conditions have resulted. All consumers, except those suffering from a real pinch, have been practically driven out of the market for the time being. Many lower grade coals have advanced more rapidly than high-price fuels. In such a market it is difficult to quote prices.

An unusual condition was noted here the past week, coals which are usually handled exclusively at Newport News finding their way here by all-rail route for local consumption. This coal was offering at a mine basis of less than $1.50 in many cases in Virginia, and after payment of freights by way of Potomac yards was still delivered here cheaper than some of the steam fuels that are handled through this port regularly. Some effort was made to handle this coal by barge from Newport News, but as rates had jumped to $1.50 a ton compared with the regular barge rate of about 50c. or less, the effort was given up. From $3.50 to $4 is being charged for shipment of coal from this port to Boston, with other New England ports in proportion.

The market is quotable on about the following basis:

	Mines	Balt.*	Fairmont	Mines	Balt.*
Geo. Crk. Big Vein	$3.00	$4.18	Ordinary mine run	$1.75	$3.23
Geo. Crk. Tyson	3.00	4.18	Ordinary ¾	2.00	3.48
Clearfield	2.75	3.93	Ordinary slack	1.65	3.13
South Fork	2.75	3.93	Low sulphur mine-run	Out of market	
Latrobe	2.65	3.83	Low sulphur ¾	Out of market	
Somerset (best)	2.75	3.93	Low sulphur slack	Out of market	
Somerset (good)	2.55	3.73			
Quemahoning	3.00	4.18			
Freeport	2.65	3.83			
Miller Vein	2.75	3.93			

* F. o. b., outside Capes.

HAMPTON ROADS

Some slight increase in demand. Prices unchanged. Government takings fair.

The coastwise and foreign movement has been better the last few days and a fairly large fleet has been loaded. The accumulation at Tidewater has been reduced somewhat although there is still more than the normal supply of coal on hand at this time. Foreign cargoes have nearly all been New River and Pocahontas run-of-mine although some gas coals have been exported. Prices remain unchanged.

The collier "Cyclops" took a large cargo for the government and the Panama R.R. collier "Achilles" took the largest cargo exported during the week. The number of vessels calling here for bunkers was only fair although there was perhaps a slight increase over the previous week's business.

Railroad Tonnages—Dumpings over the local piers for the past five weeks compare as follows:

Railroad	Week Ending Nov. 20	Nov. 27	Dec. 4	Dec. 11	Dec. 18
Norfolk & Western	100,598	118,065	116,450	87,726	104,942
Chesapeake & Ohio	67,209	93,924	81 875	70,535	55,503
Virginian	39,485	54,591	41,386	52,247	61,728
Totals	207,292	266,580	239,711	210,508	222,173

OCEAN FREIGHTS

Steamers are even more difficult to obtain than a week ago, although a number of boats have been chartered. Freight rates are at about the same level. We quote rates on coal by steamer as follows:

To	Rate	To	Rate
Havana	$3.00@3.25	Bermuda	$4.00@ 4.25
Cardenas or Sagua	3.50@4.00	Vera Cruz	5.50@ 6.00
Cienfuegos	3.75@4.00	Tampico	5.50@ 6.00
Port au Spain, Trinidad	4.75@5.00	Rio	12.00@12.60
St. Lucia	4 75@5.00	Santos*	12 00@13.20
St. Thomas	4.25@4.50	Montevideo	12.60@13.20
Barbados	4.75@5.00	Buenos Aires or La Plata†	12.60@13.20
Kingston	**4 25**	Rosario	12.00@13.20
Curacao	**4.50**	West Coast of Italy	22.80@24.00
Santiago	4.00@4.25	Barcelona**	21.60
Guantanamo	4.00@4.25	Valparaiso or Callao	12.00@13.00
Demerara	6.50@7.00	Marseilles	21.60@22.80

* Consignees paying dockage dues. ** Spanish dues for account. † Quotations on Plate coal by British steamers; neutral steamers are more difficult to obtain and the rates are always higher.

W. W. Battie & Co.'s Coal Trade Freight Report.

Note—Charters for Italy, France and Spain read: "Lay days to commence on steamer's arrival at or off port of discharge. 24c. per net register ton per day demurrage."

OHIO VALLEY

PITTSBURGH

Less bidding from Seaboard. Better prices locally for prompt, with contract unchanged. Slack strong.

Not so much is heard this week of high prices bid in the East for Pittsburgh coal but the regular line demand is better and higher prices are obtainable in the territory regularly tributary to this district. The highest prices bid by Eastern buyers a week or 10 days ago were $1.75 per gross ton, equal to $1.56 per net ton, for spot shipment with car numbers given and $2, equal to $1.78, for Pittsburgh coal already in the East. Bids now are not much over $1.50.

Car shortages are in evidence at the majority of mines but no serious curtailment has resulted as yet. With heavy demand on contracts, however, the volume of free coal available is far from large, and prompt lots of mine-run are bringing from $1.25 to $1.35. Pittsburgh No. 8 district has experienced no improvement, however, not having had the stiffening effect of a demand from the East, and quotes $1 to $1.05 for mine-run. Slack is in moderate request and is firmly held, with the prospect that any material increase in demand will send prices quickly up to almost the mine-run level.

There are hardly any negotiations on contracts. We quote prices as follows: Prompt: Slack, $1@1.05; mine-run, $1.25@1.35; ¾-in., $1.35@1.45; 1¼-in., $1.45@1.60; on contract to Apr. 1: Slack, $1@1.10; mine-run, $1.25@1.30; ¾-in., $1.35@1.40; 1¼-in., $1.45@1.50, per net ton at mine, Pittsburgh district.

BUFFALO

Bituminous market very feverish. Prices fairly unquotable. Not coal enough to go around. Buffalo far behind seaboard prices, but improving.

Bituminous—Buffalo is substantially behind the prices paid in the Eastern territory, due for the most part to the fact that the trade Westward is not so active and coal from that direction is coming here; at first it was Panhandle coal and now it is that from No. 8 in Ohio that is keeping this market down. It has developed, however, that all these coals are finding it possible to pay an extra rate to Tidewater territory and still make a profit over Buffalo prices; if this proves lasting there will soon be an end of cheap coal here. It is a long time since so many wild stories of the situation have been heard. Jobbing coal at 50c. a ton profit in large amounts is reported and some mine agents declare that they are getting a full dollar a ton more than it costs them. The market has advanced so rapidly that it has caught both sellers and consumers unprepared. Certain Eastern jobbers and consumers are still pretending that they can get coal at a moderate advance and sometimes make offers at prices much lower than salesmen are asking, but there is never any business done on this basis.

Quotations must therefore be accepted as mere efforts to size up the market in this direction, for, as one jobber puts it, the price goes up between one telephone call and the next. Quotations are:

	Pittsburgh	Allegheny Valley	Penn Smokeless
Lump	$2.90	$2.60	$2.75
Three-quarter	2.75	2.40	.....
Mine run	2.65	2.30	2.50
Slack	2.50	2.15	2.50

Quotations are f.o.b. cars at Buffalo or the Niagara bridges and per short ton except east of Rochester or Kingston, Ont.

Anthracite—The demand is only fair. The consumption does not appear likely to equal that of recent years, so that the lost ground, which seemed certain of being recovered during the winter, may not be made up.

The Lake trade closed on Dec. 12, with season's shipments amounting to 3,863,072 short tons, as against 4,285,228 tons in 1914 and 5,033,696 tons in 1913, which was the banner season.

Prices of anthracite are steady at $5.60 for grate, $5.85 for egg and stove, $6.10 for chestnut and $4.30 for pea, per long ton, f.o.b. cars at Buffalo, with 25c. additional for delivering on board vessels.

TORONTO, CAN.

Market fairly active and movement better. Some price advances.

The market for all grades of coal continues fairly active. Dealers are keeping up stocks and supplies are coming forward more freely owing to improved transportation conditions. A noticeable feature of the season's trade is the considerably increased demand for smokeless semi-bituminous coal due to the more rigid enforcement of the smoke laws. There is some scarcity of this grade at present owing to the demand of the Eastern states. It is quoted wholesale per short ton f.o.b. cars at destination at $4 for lump and $3.75 for slack; retail lump, $5.75. Anthracite was advanced this week, quotations for best grades per short ton being as follows: Retail anthracite, egg, stove and nut $8; grate, $7.75; pea, $6.75. Bituminous retail steam $5.25, screenings, $4.25 to $4.50; domestic lump, $6; cannel, $8. Wholesale f.o.b. cars at destination, three-quarter lump, $3.79, screenings $3.15.

COLUMBUS

The colder weather stimulates the domestic trade still farther. Steam trade active and demands for tonnage increasing. Prices remain firm.

The best feature of the coal trade in Ohio has been the increase in orders for domestic tonnage. The lower temperatures are having their effect and dealers are making an effort to accumulate stocks. The demand is well distributed among the various grades and varieties.

Retail trade has been more active than formerly. Dealers are rushed with many small orders, as usual when the first real cold snap appears. Retailers stocks have been sufficient for the extra demands so far but they are not large. Retail prices are ruling firm at the levels which have prevailed for the past 10 days. All recent advances have been maintained.

With the general expansion in manufacturing the demand for steam fuel is increasing constantly and some consumers have trouble in getting a sufficient tonnage. Premiums are being paid for prompt shipment. Iron and steel plants are especially active. There is a scarcity in the supply of the small sizes and prices have been farther advanced.

The recent slump in Pocahontas has been checked by the colder weather. Considerable tonnage from that district is now going Eastward. There is a considerable demand for steam sizes from the Canadian market and a large tonnage is being shipped across the border.

Anthracite is stronger all along the line and there is a scarcity of chestnut size.

Prices in Ohio fields f.o.b. mines, per short tons, are as follows:

	Hocking	Pomeroy	Eastern Ohio	Kanawha
Re-screened lump	$1.60	$1.65	.....	.....
Inch and a quarter	1.50	1.50	$1.35	$1.50
Three-quarter-inch	1.35	1.40	.....	1.35
Nut	1.25	1.30	.....	1.25
Mine-run	1.15	1.20	1.05	1.10
Nut, pea and slack	.90	.95	.80	.80
Coarse slack	.80	.85	.70	.70

CLEVELAND

Market a little weaker. Receipts fairly liberal, but industrial stocks are light. Holiday curtailment will restrict the demand. The retail trade only fair with buying comparatively light.

Pocahontas remains unchanged at the prevailing low prices of the last two weeks. Retail dealers are holding shipments down to their immediate requirements and the market is not so brisk as it was following the first cold snap of the season.

The high prices in other sections have practically restricted Cleveland buyers to No. 8 coal. Youghiogheny is selling at $1.50 at the mines. West Virginia low sulphur fuels are not selling here and the outlook is for very little coal except No. 8 for some time to come. The supply is low though the demand does not seem to show much improvement.

A few cars of No. 8 coal have been shipped to Tidewater; the price at which it was sold is reported to be $1.75 a gross ton at the mines.

Locally the market is up ten to fifteen cents a ton on No. 8.

Jobbers are paying the following prices f.o.b. Cleveland per short ton:

	Pocahontas	Youghiogheny	Bergholz	Wainwright	No. 8
Freight	$1.45	$1.00	$0.70	$0.70	$0.90
Lump	3.25	.....	.....	.....	.....
Lump, 6 in.	.....	.....	2.30	.....	.....
Lump, 1¼ in.	.....	2.60	2.10	2.30	2.15
Lump, ¾ in.	.....	2.50	2.00	2.10	2.05@2.10
Lump, 3 in.	.....	.....	.....	2.40	.....
Egg	3.25	.....	.....	.....	
Mine run	2.70	2.50	1.90	1.95	2.05@2.10
Slack	.....	2.00	1.90	1.90	1.95

TOLEDO

The colder weather has stiffened up the domestic market somewhat but prices remain practically unchanged. The steam trade is stronger and the prices on slack are firm. None of the large Toledo manufacturing concerns are overstocked and yet there is no dearth of supplies. The car congestion is not so bad as it was but is still a factor to be reckoned with. Practically all the coal on the local docks has been cleaned up and the Lake movement is almost entirely over for the season. Jobbers here are doing a fair business.

DETROIT

Buying of steam coal continues in good volume. Domestic sizes are more popular. Anthracite is sluggish except chestnut. Lake shippers seek tonnage for next season.

Bituminous—Demand for steam coal continues steady. Small sizes are in the best demand and shortest supply. Weather conditions have been more favorable and domestic business is showing a gradually increasing volume. Consignment stock is plentiful, but is causing no serious weakening of prices.

Anthracite—Buying of the larger sizes of anthracite continues in small volume, the market appearing sluggish. Chestnut size is meeting with a ready demand and is occasionally scarce. Some of the shippers have been able to sell chestnut at a premium of 25c. a ton, when they had it. The delivery is sometimes delayed.

Lake Trade—Shippers are making considerable effort to close contracts for vessel capacity to move coal next season. Some business in that line has been done and one shipper is said to have placed a considerable amount under contract not all of which will be moved next season. Vessel owners are confident the carrying rate from Lake Erie to Lake Michigan ports will be advanced at least to 35c., as ore men have bought or placed under charter a large proportion of the independent vessels, with the stipulation in several instances that boats make the upbound trip without cargo to facilitate dispatch.

CINCINNATI

Steam grades strong and prices are stiffer. Heavy rains interfere with movement.

The steam market remains strong. Some nut and slack was selling in Cincinnati during the current week at 90 and 95c., while mine-run in several small quantities brought $1 to $1.10 per ton, and this in face of reports from other Western centers to the effect that mine-run coal is selling for considerably less. Warm weather during the early part of the week brought a temporary lull to the domestic market, but lower temperatures later should bring the domestic market back to the same basis that it has held during the past two or three weeks.

Movement off the Chesapeake and Ohio R.R. may be retarded for 3 or 4 days from Logan County account of heavy slides. This report came from the mines, but has not been confirmed by the railroad.

LOUISVILLE

The market has naturally responded to the stimulus of the colder weather, together with the continued improvement in industrial conditions. It is, however, about a normal market, with prices for block of the eastern Kentucky grades ranging nearer to $2 than heretofore, although the prices at the mines, long-ton basis, are sometimes down to the November level. Nut and slack is stronger and the demand still good, with the supply short.

COKE

CONNELLSVILLE

Prompt furnace coke fluctuating daily. Foundry coke strong. Little interest in contracts. Production increased sharply.

The market for prompt furnace coke has been fluctuating widely. On some days spot furnace coke has sold at $3.50 while the next day the highest bid would be only $3. The total demand has been very limited and the supplies have been correspondingly short. The last sales last week were at $3 and this week no market has been definitely developed, although the usual quotation is $3.50. There are two or three cases of negotiations on contracts for the first three or first six months of next year, and one or two inquiries are out for the second half, from consumers who are already covered for the first half.

Foundry coke continues very strong. At least one maker of high-grade foundry coke has a minimum quotation of $4 for spot foundry, and has been able to effect sales at this figure of single carloads. There are other brands available for less. There does not seem to be much business under negotiation for the first half of the new year. The majority of contracts made last May and June were for the twelve months beginning July 1. The market is quotable approximately as follows: Prompt furnace, $3@3.50; contract, first half, $2.35@2.50; year 1916, $2.25@2.35; prompt foundry, $3.50@4; contract, $3@3.40, per net ton at oven. The H. C. Frick Coke Co. had an option on a large block of coke for delivery over the first half at $2.50 and has allowed it to lapse.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Dec. 11 at 451,896 tons, an increase of 14,645 tons, and shipments at 451,175 tons, a decrease of 6,998 tons.

Buffalo—The market has advanced sharply due to heavy demand and the high price of coal. There are no stocks of account anywhere and the prospect of production exceeding demand is small. As there is no other source of supply here this market has to pay full prices, which rule at $5.25@5.60 for 72-hr. Connellsville foundry, $4.36@4.60 for furnace and $4.10@4.20 for stock, this latter not having advanced as much as other grades.

Chicago—Metallurgical and domestic coke are firm with demand still outstripping the supply. Gas house coke has moved up 25c. per ton. Western byproduct ovens are pushed to the limit of their capacity. Prices per net ton, f.o.b. cars Chicago, are as follows: Byproduct, foundry, $5.25@5.75; byproduct, domestic, $4.75@4.95; Connellsville, $5.25@5.75; Wise County, $5.25@5.50; gas coke, $4@4.25.

St. Louis—The general coke situation is good. A fair volume is moving for domestic use. The industrial consumption is improving with increased operations among the manufactories. Prices per net ton f.o.b. cars St. Louis, are as follows: Byproduct all sizes, $5. Gas house lump and egg, $4.25.

MIDDLE WESTERN

GENERAL REVIEW

Colder weather improves domestic trade. Great activity in steam sizes. Eastern coals fluctuating badly. Anthracite dull.

The weather is without doubt the dominating factor in the domestic markets. The week was ushered in with the lowest temperatures of the season which continued for three days and caused brisk buying by the public. Later in the week the shippers felt the rebound, and domestic orders for re-stocking were much in evidence. Maximum shipments of coarse steam coals continue at high prices, and activity in screenings is unabated. Competitive bidding in several quarters for free tonnage of fine coal has occurred, with the result that some sales have been made very near the mine-run price. Buyers seem more eager to obtain small sizes than coarse steam sizes. The drift of screenings prices is still upward.

The tone of West Virginia smokeless is sluggish, and sales are still being made at indifferent prices. Anthracite buying over the Western country is apathetic, and there is not the snap of other years to the hard-coal market. Adherence to schedule prices generally characterizes Western coals, and as delays in transportation due to snowy weather increase and labor becomes less plentiful, the few concessions that have been made to move surplus domestic sizes are becoming negligible. The car supply at Western mines has been easier, and but little delay has occurred in the movement as a result of the snowy and colder weather.

CHICAGO

Weather favors heavier consumption of domestic sizes. Steam coals still advancing smokeless stronger. Anthracite demand improved.

The Southern Illinois situation has been strengthened during the past week; lump and egg have been moving in much better volume, and screenings are strong at around 85c. Most mines have been running full time this week, and the surplus domestic sizes on track have all been cleaned up. If the present influx of orders for domestic sizes continues, the mines will soon be oversold.

Railroad storage coal is still being shipped heavily from the Springfield district, and screenings are averaging around 75c. Though sales of domestic sizes are not especially large, a marked improvement in the volume of orders from the Chicago district was noticed early in the week.

The demand for all Indiana grades and sizes now exceeds production, and some operators are complaining prices are not as high as they should be; 1¼-in. steam lump is particularly strong, and screenings range from 75c. to 85c. Domestic lump has shown increased vigor by reason of colder weather. Retailers are doing a rushing business, and jobbers are having difficulty in obtaining sufficient tonnage to meet their orders.

The market for domestic sizes of smokeless has improved a little, but it will be another ten days before it is normal. Delayed movement and colder weather had a beneficial effect on lump and egg. Most mine-run has been sold at $1.40. There is evidently too much of a disposition in the smokeless field to cut prices on the slightest pretext, which keeps the buyer uncertain. Pennsylvania smokeless coals are firm, and splint prices are well held.

Hocking prices have been well maintained, 1¼-in. lump realizing from $1.50 to $1.60; 6-in. lump $1.85 to $2, and 3-in. re-screened, $1.75 to $1.85.

Kentucky coals show less varied prices, the higher grades of block selling at about $2 per ton; egg averaging $1.60, and fine coal being strong at around 80c. to 90c.

The movement of anthracite from the mines to this district was interrupted to some extent during the early part of the week, but there was enough coal on hand to meet the spurt of orders due to colder weather. Apparently some of the outlying country dealers have not stored much anthracite, and the cold weather caught them short of stocks. Prices have held close to circular.

Quotations in the Chicago market are as follows: Per net ton f.o.b. cars mines:

	Williamson and Franklin Co.	Springfield	Sullivan	Clinton	Knox and Greene Cos.
Lump......	$1.60@1.75	$1.50@1.75	$1.60@1.70	$1.50@1.60	$1.45@1.60

ST. LOUIS

Colder weather and improved steam consumption create a better tone in the market. Car supply short.

Increased activity was quite noticeable the past week. Domestic coal moved in better volume, due to slightly colder weather. With constant improvement in the general industrial situation comes a proportionate increase in the factory consumption and there has been some improvement due to the call for storage coal; some of the railroads in this section have commenced to store as well as a few of the industrials. Screenings have held steady without sign of retarding. The car supply is short, more so than it realized, but it is not as yet seriously felt, because mining operations are still somewhat restricted, except in a few instances.

Quotations f.o.b. mines during the past week have ranged on the following basis per short ton:

	Wililamson and Franklin	Staunton and Mt. Olive	Montgomery Co.	Intermediate	Standard
8 in. lump				$1.25	$1.10 @ 1.15
6 in. lump	$1.50	$1.25	$1.25	1.25	1.10 @ 1.15
3 in. lump	1.40	1.15		1.25	
2 in. lump	1.35	1.15		1.20	.90 @ 1.00
1½ in. lump	1.30		1.10	1.10	.90 @ .95
6x3 in. egg	1.40			1.25	1.00 @ 1.10
6x2 in. egg			1.10	1.10	.85 @ .90
6x1½ in. egg	1.30				
No. 1 nut	1.20			1.10	.90 @ 1.00
No. 2 nut	1.10	.75		.90	.75 @ .80
Mine run	1.10	1.00	1.05	1.05	.85 @ .90
Screenings	.75	.65	.65	.65	.60 @ .65

No 2 washed nut	1.35	1.25		1.25	1.25
No. 3 washed nut	1.25	1.15		1.15	1.15
No. 4 washed pea	1.25	1.00		1.00	1.00
No. 5 washed slack	.75	.65		.65	.65

DULUTH

Market quiet. Weather continues mild. Navigation closes for the year.

Mild weather for the past three weeks, has caused a rather slow movement of coal. Salesmen report business quiet due to weather conditions and in nearly every instance the country dealers and retailers have supplies to last for the time being or until the arrival of a cold snap. The railroads moved a fair tonnage during the week to interior points.

Navigation has closed and no further coal cargoes are due to arrive this year. Although no tonnage figures have as yet been made public, it is expected that the bituminous arrivals will show a decrease over those of last year, while anthracite will make a slight gain. No change in prices has as yet been announced. Quotations are as follows, per short ton, f.o.b. cars at docks, Duluth.

	Yough	Splint	Hock	Smokeless	Elkhorn
Lump...........	$3.40	$3.40	$3.40	$4.75	$3.75
Dock run........	3.10	3.10	3.10	3.25	3.25
Egg, stove and nut	3.40	3.40	3.40	4.75	3.65
Screenings.......	2.40	2.40	2.25	2.75	2.55

The movement of anthracite during the past week has been very slow, small orders of the minimum car variety prevailing and the disposition of the dealers was to purchase no more than was absolutely necessary. Prices are as follows: Nut, $7.10, egg and stove, $6.85; pea, $5.55 and buckwheat, $4, all per short ton f.o.b. cars at the Duluth docks.

INDIANAPOLIS

Moderate car shortage. Good demand all along the line. Retail prices advanced.

Indiana mines are again feeling the pinch of the short supply of cars. No complaint is heard as yet as the shortage is not seriously handicapping the operators. It is the opinion of the trade that the car congestion in the East is sure to be reflected here, sooner or later, and when the cold weather comes, car trouble may be anticipated.

There is good demand for all grades though domestic grades are easy, due to a lack of wintry weather. In the open market 80 and 85c. can be obtained for screenings, f.o.b. mine; for domestic lump $1.65 for best Nos. 4 and 6 and $1.50 for 2½ in. Retailers have advanced prices of forked Kanawha lump and Ohio Hocking lump 25c. a ton and have made the same raise on prices of Ohio Hocking washed egg, Kentucky lump and chestnut, stove, egg and grate anthracite. The new schedule of prices, in force Dec. 15 is:

Linton No. 4 lump forked.....	$3.25	Pocahontas forked lump......	$6.00
Indiana lump forked..........	3.00	Pocahontas shoveled lump....	5.50
Indiana lump and egg, screened.	2.75	Pocahontas mine run.........	4.50
Kanawha lump, forked........	4.50	Pocahontas, nut and slack....	3.75
Ohio Hocking, lump..........	4.50	Anthracite, chestnut..........	8.50
Ohio Hocking, wash egg.......	4.75	Anthracite, stove and egg.....	8.25
Kentucky lump..............	4.75	Anthracite, grate............	8.00
Ohio Jackson lump, forked....	5.25	Connellsville coke...........	6.00
Blossburg smithing...........	5.50	Indianapolis by-product coke	6.00
Cannel lump................	6.00		

PRODUCTION AND TRANSPORTATION STATISTICS

NORFOLK & WESTERN

Distribution of shipments for October and November follows:

	October			November		
	Shipped	Tipple	Total	Shipped	Tipple	Total
Pocahontas.......	1,620,736	12,436	1,633,172	1,387,567	12,137	1,399,704
Tug River........	375,743	2,788	378,531	339,154	3,474	342,628

Note—The figures in the above table do not include Admiralty and certain other shipments.

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

+Indicates contracts regarding which official information has been received.

Recast

In the following table we give a list of all old contracts coming up for consideration during the ensuing week. The table gives our contract number, the name of the purchaser, city tonnage and page on which the detail notice appeared.

No.	Purchaser	City	State	Tonnage	Page
1603	Springfield Lake San.,	Krumroy Sta.,	Ohio,	15,000	737
1654	Chester Tube Co.,	Chester,	Penn.		911
1655	Chester Brewing Co.,	Chester,	Penn.	600	911
1656	Caledonia Mills,	Clifton Hgts.,	Penn.		911
1659	Tilden-Morris Co.,	Eddystone,	Penn.		911
1661	Scheidt Brewing Co.,	Norristown,	Penn.		911
1662	Wapakoneta Elec. & Water Wks.,	Wapakoneta,	Ohio	4,000b	911
1664	Hotel Dennis,	Atlantic City,	N. J.	4,000a	911
1678	Hahnemann Hospital	Philadelphia,	Penn.	3,000a	912
1680	G. P. Pilling & Sons,	Philadelphia,	Penn.	2,500a	912
1681	Spreckles Sugar Refining Co.,	Philadelphia,	Penn.	20,000a	912
1685	Union Cap. Life Ins. Co.	Cincinnati,	Ohio	5,000a	957
1685	Union Cap. Life Ins. Co.,	Cincinnati,	Ohio	200b	957[1]
1686	Alton Steel Hoop Co.,	Alton,	Ill.	250	957[2]
1687	Local Elec. Lt. Plant,	Millvalle,	Penn.	30,600b	957
1692	Advance Compressor Co.,	Battle, Creek,	Mich.	400b	957[3]
1693	Indus. Stor. & Warehouse Co.,	Philadelphia,	Penn.	6,000b	957[2]
1694	T. Devlin Mfg. Co.,	Philadelphia,	Penn.	4,300a	957
1694	T. Devlin Mfg. Co.,	Philadelphia,	Penn.	5,500b	957
1694	T. Devlin Mfg. Co.,	Philadelphia,	Penn.	900c	957
1698	Dept. Public Works	Milwaukee,	Wis.	2,000b	958
1704	Counties Gas & Elec. Co.,	Norristown,	Penn.	5,000	958
1705	Dourte-Hessell Mfg. C.,	Colo. Springs,	Colo.	500b	958
1712	W. Green Blower Co.,	Pottstown,	Penn.	600	998
1713	McClintic-Marshall Construction Co.,	Pottstown,	Penn.	1,200	998
1715	Water and Light Dept.,	Austin,	Tex.	60b	998[1]
1716	Reading Hardware Co.,	Reading,	Penn.	5,000	998
1718	Robesonia Iron Co.,	Robesonia,	Penn.	35,000	998
1719	Taubell, Inc.,	Riverside,	Penn.	8,000	998
1720	Gaynor Glass Works	Salem,	N. J.	4,000	998[3]
1722	Quenelda Graphite Co.,	Quenelda,	Ala.	1,560 130	998
1723	Lt. & Power Dept.,	Russellville,	Ky.	2,880b	998[3]
1724	Elec. Short Line Ry.,	Minneapolis,	Minn.	2,200	998
1725	Wolf Co.,	Chambersburg,	Penn.	2,250b	998[2]
1729	Abernathy Furniture Co.,	Kansas City,	Mo.		999[2]
1733	Peerless Cement Co.,	Union City,	Mich.	45,000	999[1]
1734	De Queen Ice & Light Co.,	De Queen	Ark.	2,000b	999
1735	Borough Lt. Plant	Tarentum,	Penn.	3,000b	999
1736	Lt. & Water Plant,	So. Whitley,	Ind.		999
1766	Link-Belt Co.,	Philadelphia,	Penn.	1,500a	1044
1767	Southwark Mfg. Co.	Camden,	N. J.	2,500a	1044
1769	Baldt Steel Co.,	New Castle,	Del.		1044
1770	Struse & Sons,	Philadelphia,	Penn.	2,000	1044
1773	Ames Shovel & Tool Co.,	Cheltenham,	Penn.	1,500a	1044
1774	Amer. Laundry Co.,	NewOrleans,	La.,	25,000	1044
1777	Western Penitentiary Penn.,	Pittsburgh,	Penn.		1044

a Indicates anthracite coal. b Indicates bituminous. c Indicates coke.

[1] Per day. [2] Per week. [3] Per month.

Notes and Awards

Under this heading additional or supplemental information regarding old contracts appears, together with the page number of the original notice.

1029—Kansas City, Mo.—This contract (p. 115), which provides for furnishing the local branch of the Cudahy Packing Co. with its winter's fuel supply, involving approximately 200 tons per day, has been awarded to the **Cherokee Fuel Co.** The contract will expire in June. Address Purchasing Agent, Cudahy Packing Co., Kansas City, Mo.

1179—Kansas City, Mo.—Experiments are being conducted on this contract (p. 244), which provides for furnishing the Kansas City Terminal Ry. Co. with approximately 250 tons of coal per day, and the contract will probably be concluded early next month. Address Pur. Agt. A. J. Stewart, Kansas City Terminal Co., Union Station, Kansas City, Mo.

1515—Saratoga Springs, N. Y.—This contract (pp. 577, 660), was awarded to the **Saratoga Coal Co.,** at $6.90 for egg, and $6.37 for grate. The contract provides for 100 tons for immediate delivery, and 100 tons to be delivered later. Address Comr. Michael J. Mulqueen, Saratoga Springs, N. Y.

+1525—New Hampton, Iowa—This contract (p. 616), which provides for furnishing the County Government with approximately 200 tons of coal has been awarded to the **Merchants Coal and Coke Co.** of Chicago, at $4 per ton for Brazil block coal. There were two other bids on the business. Address Audr. P. E. McGinn, New Hampton, Iowa.

+1537—Le Mars, Iowa—This contract (p. 617), which provides for furnishing the Haynes County Court House, Jail and County Poor with coal during the ensuing year, has been awarded to the **M. A. Moore Co.** on Lincoln Springfield lump at $4.68 per ton in car lots, and $5.18 delivered. Address County Audr. J. M. Hayes, Le Mars, Iowa.

1653—East St. Louis, Ill.—Purchases on this contract (p. 911), which provides for furnishing the requirements of the Granby Smelting and Mining Co., will be confined to the open market for at least another month. Address Supt. Ross Boles, Granby Smelting and Mining Co., East St. Louis, Ill.

+1674—Erie, Penn.—Proposals on this contract (p. 912), which provides for furnishing the fuel requirements of the City Government, will not be received until January, at which time they will be acted upon by a new council. Address Supt. Frank E. Pelow, Dept. of Parks and Public Property, Erie, Penn.

1677—Chicago, Ill.—Bids have been received on the contract for furnishing the City Government with coal (pp. 912, 1043), as follows, the prices given being those computed by the city government as the actual cost in heat units according to analysis submitted per ton:

Pumping Stations: Bickett Coal and Coke Co., Chicago Ave., $2.46; 14th St., $2.43; Harrison St., $2.02; 68th St., $1.62. E. Puttkammer Coal Co., Springfield Ave., $2.05; 22d St., $2.12 and $1.72; Central Park, $1.96 (11,000 tons of mine-run also the same on 35,200 tons of nut). Ender Coal and Coke Co., Roseland, $1.60; Central Park, $1.95 on 11,000 tons of mine-run and $2 on 35,200 tons of nut. J. J. Conners, Rogers Park, $2.71; Lake View, $2.49.

Bureau of Engineering: Consumers Coal Co., $3.97 on 1,400 tons of lump "A" and $5.345 on 5,675 tons of lump "B." Pilsen Coal Co., $3.705 on 1,400 tons of lump "A" and $5.246 on 5,675 tons of lump "B"; in District No. 4, Consumers Coal Co. $5.375 on 3,500 tons of lump "B"; Pilsen Coal Co. $4.308 on 3,500 tons of lump "B."

Fire Department: Consumers Coal Co., $6.97 on 899 tons of range or chestnut; $3.50 on 883 tons of bituminous lump; $3.50 and $3.378 on 1,617 tons of lump; $7.35 and $6.85 on 916 tons of anthracite egg; $7.47 and $6.97 on 944 tons of range or chestnut; $4 and $3.50 on 2,165 tons of bituminous lump; $4 on 1,419 tons of lump. Pilsen Coal Co., $3.345 and $2.50 on 1,617 tons of bituminous lump. Bickett Coal and Coke Co., $2.52 and $2.17 on 6,640 tons of mine-run; $2.62 on 9,000 tons of bituminous nut.

Department of Police: Consumers Coal Co., $4.075 on 850 tons of mine-run; $3.956 on 1,145 tons of mine-run.

Department of Health: Consumers Coal Co., $4.076 on 925 tons of mine-run; $1.75 on 600 tons of screenings. Pilsen Coal Co., $3.85 on 3,070 tons of mine-run; $1.655 on 26,000 tons of screenings; $1.75 on 900 tons of bituminous screenings. Ender Coal Co., $4.10 on 3,070 tons of mine-run; $1.57 on 26,000 tons of screenings.

As a rule only bids on contracts involving 1,000 tons or more are given in the above, although in a few instances tonnages somewhat less are noted. Address City Engr. John Ericson, Bureau of Engineering, Department of Public Works, Chicago, Ill. (No. 312, Vol. 7, pp. 488, 666, 748, 915.)

+1746—New York, N. Y.—Only one bid has been received on this contract (p. 999), which provides for furnishing the Department of Docks and Ferries with approximately 22,000 gross tons of anthracite and bituminous coal. This bid, which was submitted by Pattison & Bowns, was: Buckwheat No 1, $4.97; bituminous slack, $4.97; buckwheat No. 3, $4.69. Address Comr. of Docks R. A. C. Smith, Pier "A," Battery Place, New York (No. 1583, Col. 8, pp. 700, 828.)

1747—New York, N. Y.—Only one bid was received on this contract (p. 1043), which provides for furnishing approximately 3,500,000 lb. of anthracite coal for the Asphalt Plant, this bid being submitted by Charles E. Norton & Co. at $1.41½ per thousand pounds for buckwheat and $2.90 for egg. Address Borough Pres. Marcus M. Marks, Municipal Bldg., New York, N. Y. (No. 605, Vol. 7, pp. 795, 918.)

1764—New York, N. Y.—No bids were received on this contract (p. 1044), which provides for furnishing approximately 700 tons of anthracite coal for various public buildings in the Borough of Richmond, S. I. It is understood that the business will be readvertised again. Address Pres. Calvin D. Van Name, Room 18, Borough Hall, New Brighton, Staten Island.

New Business

Volume and page number in parenthesis at the end of an item indicate where the previous announcement, bids and awards on that contract may be found.

1783—Atlantic City, N. J.—The Somers Brick Co. at this place usually send out inquiries for its annual coal contracts about Feb. 1, and concludes the business on Mar. 1. They require about 800 tons. The plant is located at Bakersville, N. J. Address Purchasing Agent, Somers Brick Co., Atlantic City, N. J.

1784—Bridgeport, Conn.—The Diamond State Fibre Co. usually send out inquiries on its annual fuel contract about Feb. 1, and conclude the business on Apr. 1. They require approximately 30,000 tons, and deliveries are made by Philadelphia & Reading and Pennsylvania railroads. Address Pur. Agt. Yates, The Diamond State Fibre Co., Bridgeport, Conn.

1785—Bridgeport, Conn.—The A. H. March Packing Co. usually send out inquiries for its annual fuel requirements about Feb. 1, and conclude the contract on Apr. 1. Deliveries are made by Philadelphia & Reading Ry. Address Pur. Agt. March, The A. H. March Packing Co., Bridgeport, Conn.

1786—Chester, Penn.—A. P. Musselman usually sends out inquiries for his annual fuel requirements, involving approximately 600 tons on Feb. 1, and the business is concluded on Apr. 1. Address A. P. Musselman, Chester, Penn.

1787—Chicago, Ill.—The requirements of the Hirsh, Stein & Co., involving about one car per day of Illinois and Indiana lump coal, will be purchased in the open market. Address Pur. Agt. J. Tecka, Hirsh, Stein & Co., 2841 S. Ashland Ave., Chicago, Ill.

1788—Philadelphia, Penn.—The S. J. Creswell Iron Works is in the market for its annual fuel supply, involving approximately 2,000 tons of steamboat and rice coal. The contract becomes effective Jan. 1. Address Secretary, The S. J. Creswell Iron Works, 23rd and Race St., Philadelphia, Penn.

1789—Coatesville, Penn.—Worth Brothers at this place usually send out inquiries on their annual contract, involving approximately 13,500 tons about Feb. 1, and conclude the business on Apr. 1. Deliveries are made by Philadelphia & Reading and Pennsylvania railroads. Address Pur. Agt. Cairnes, Worth Brothers Co., Coatesville, Penn.

1790—Coatesville, Penn.—J. Shallcross & Son usually send out inquiries on their annual fuel requirements about Feb. 1, and conclude the business on Apr. 1. Deliveries are made by Pennsylvania R.R. Address Purchasing Agent, J. Shallcross & Son, Coatesville, Penn.

1791—Conshohocken, Penn.—J. Wood Brothers & Co. at this place usually send out inquiries for its annual fuel requirements, involving approximately 40,000 tons, about Feb. 1, and conclude the contract about Apr. 1. Deliveries are made by the Philadelphia & Reading and Pennsylvania railroads. Address Pur. Agt. Wood, J. Wood Bros. & Co., Conshohocken, Penn.

1792—Chicago, Ill.—The contract of C. F. Claussen & Co., at this place will be negotiated about Feb. 1. Approximately 28 cars of washed nut coal will be required. Address Pur. Agt. H. D. Claussen, C. F. Claussen & Co., 5147 S. Western Ave., Chicago, Ill.

1793—Camden, N. J.—The Southwark Steel Co. at this place usually send out inquiries for its annual fuel contracts, involving approximately 35,000 tons of bituminous and coke about Feb. 15, and conclude the business on Mar. 1. Address Pur. Agt. Hanson, Southwark Steel Co., Camden, N. J.

1794—Camden, N. J.—The West Jersey Paper Manufacturing Co. usually send out inquiries for its annual fuel contracts involving approximately 5,000 tons on Feb. 1 and conclude the business on Apr. 1 Deliveries are made by water. Address Pur. Agt. Stafford, West Jersey Paper Manufacturing Co., Camden, N. J.

1795—Harrisburg, Penn.—The Harrisburg Pipe and Pipe Bending Co. at this place usually send out inquiries for its annual fuel requirements about Feb. 1 and conclude the business about Apr. 1. The company requires about 50,000 tons of gas coal and 250,000 tons of low volatile bituminous. Deliveries are made by the Pennsylvania R.R. Address Pur. Agt. W. P. Hildrup, Jr., Harrisburg Pipe and Pipe Bending Co., Harrisburg, Penn.

1796—Mays Landing, N. J.—The Atlantic Brick Manufacturing Co. at this place usually send out inquiries for its annual contract involving approximately 5,000 tons on Feb. 1 and conclude the business on Apr. 1. Address Pur. Agt. T. LaRue, Bartlett Building, Atlantic City, N. J.

1797—New York City, N. Y.—The Warren Manufacturing Co. at this place usually send out inquiries for its annual fuel contracts about Feb. 15, and conclude the business on Apr. 1. The company uses Lehigh rice and buckwheat coal. Address Pur. Agt. R. G. Spencer, Warren Manufacturing Co., 41 Park Row, New York City.

1798—New York, N. Y.—The Cuneo Importing Co. usually send out inquiries for its annual fuel requirements about Feb. 15, and conclude the business on Apr. 1. The company has boats at both New York and Philadelphia, and require about 20,000 tons at the former and 100,00 tons at the latter place. The New York point of delivery is at Pier 10, North River. Address Pur. Agt. Spado, Cuneo Importing Co., Pier 10, North River, New York City.

1799—Plymouth, Penn.—The American Magnesia Covering Co., usually send out inquiries for its annual fuel contracts about Feb. 15, and concludes the business about Apr. 1. Address Pur. Agt. Crabbs, American Magnesia Covering Co., Plymouth, Penn.

1800—Philadelphia, Penn.—The Girard Iron Works at this place is in the market for its annual fuel supply, involving approximately 800 tons of anthracite rice coal. Address Purchasing Agent Girard Iron Works, 22nd and Allegheny Ave., Philadelphia, Penn.

1801—Upland, Penn.—The Chessaqua Silk Co. usually send out inquiries on their annual fuel contract, involving approximately 2,000 tons on Feb. 1 and the contract is concluded about Mar. 1. The company requires about 2,000 tons, and deliveries are by Philadelphia & Reading Ry. Address Pur. Agt. Thomas, Chessaqua Silk Co., Upland, Penn.

1802—Westchester, Penn.—The Westchester I. & C. S. Co. usually send out inquiries for its annual coal contract involving approximately 2,500 tons about Feb. 1, and the business is concluded in Apr. 1. Deliveries are by Philadelphia & Reading Ry. Address Purchasing Agent, Westchester I. & C. Co., Westchester, Penn.

1803—Westchester, Penn.—The Westchester Gas Co. usually sends out inquiries for its annual fuel contract involving approximately 600 tons about Feb. 1, the business being concluded on Apr. 1. Deliveries are by Philadelphia & Reading Ry. Address Pur. Agt. Samson, Westchester Gas Co., Westchester, Penn.

1804—Allentown, Penn.—The American Steel and Wire Co. at this place usually send out inquiries for its annual coal contract about Feb. 1, the business being concluded on Apr. 1. They require about 24,000 tons of buckwheat No. 2 and 12,000 tons of gas slack. Deliveries are made by Lehigh Valley R.R. Address Pur. Agt. E. E. Stone, American Steel and Wire Co., Cleveland, Ohio.

1805—Allentown, Penn.—The National Silk Die Works at this place usually send out inquiries for its contracts involving approximately 100,000 tons of coal, about Feb. 1. Deliveries are made by Lehigh Valley and Central Railroad of New Jersey. Address Pur. Agt. Lotte, National Die Works, Allentown, Penn.

1806—Allentown, Penn.—The Allentown Flint Bottle Works usually send out inquiries for its annual contract about Feb. 1, and the business is concluded about Apr. 1. The contract involves approximately 50,000 tons of low sulphur gas coal, and deliveries are made by Lehigh Valley Ry. Address Purchasing Agent, Allentown Flint Bottle Works, Allentown, Penn.

1807—Ambler, Penn.—The Keasbey & Mattison Co. at this place usually send out inquiries on its annual coal contract about Feb. 1, and conclude the business in Apr. 1. Deliveries are made by Philadelphia & Reading Ry. Address Purchasing Agent, Keasbey & Mattison Co., Ambler, Penn.

+1808—Easton, Penn.—The City Government is receiving bids for furnishing the electric-light station with approximately 1,500 gross tons of buckwheat, 90 tons of stove for the central fire station and four other engine houses, and 70 tons of stove for the municipal building. Bids must be submitted on blank forms, which may be obtained on application, and must be accompanied by certified check for $100. Address City Clerk, Easton, Penn.

1809—Jackson, Mich.—The Peninsular Portland Cement Co. will negotiate its annual contract, involving approximately 40,000 tons of coarse slack coal, some time in February. Deliveries are made by railroad, in equal monthly proportions. Address Pur. Agt. G. V. Cody, Peninsular Portland Cement Co., Jackson, Mich.

1810—Cumberland, Md.—Bids will be received until 9 a.m., Dec. 27, for furnishing the local electric-light plant with mine-run coal as may be required during the ensuing year. Bids should be on a long-ton basis and both in car lots, f.o.b. Smith's siding, and delivered in boiler room. Address Comr. J. S. Schriver, Water and Light Dept., Cumberland, Md.

1811—St. Louis, Mo.—The Jack Daniels Distilling Co. will begin testing out various grades of 2-in. lump coal preparatory to negotiating its annual fuel requirements, involving about 130 tons per month, on Jan. 1. Address Pur. Agt. Harry Newsham, Jack Daniels Distilling Co., St. Louis, Mo.

1812—Buffalo, N. Y.—The Morlook Collieries Co. at this place is in the market for a tonnage of Pocahontas and New River Smokeless coal for prompt shipment. Address the Morlook Collieries Co., 876 Ellicott Sq., Buffalo, N. Y.

+1813—Greenfield, Ind.—Bids are being received for furnishing the County Heating Plant and Poor Farm, with approximately 800 tons of mine-run, 1¼-in. lump and egg coal. This contract is usually let through a local dealer. Address Purchasing Agent, County Poor Farm, Greenfield, Ind.

1814—Homestead, Penn.—Bids will be received until Jan. 1 for furnishing the local Water-Works with slack coal as may be required during the ensuing year. Bids should be made f.o.b. cars at the water-works siding. Address Borough Clk. Frank Trautman, Homestead Water-Works, Homestead, Penn.

+1815—Moose Jaw, Saskatchewan, Can.—Bids will be received until noon, Dec. 30, for furnishing the City Power Plant with its annual fuel supply, involving approximately 12,000 tons of coal. Address Comr. Jas. Pascoe, City Comr., Moose Jaw, Saskatchewan, Can.

1816—St. Louis, Mo.—The Mine La Motte Co. is in the market for its annual fuel supply, involving approximately 1,500 tons of 1½-in. screenings and 1,200 tons of mine-run per month, deliveries to be made by Iron Mt. R.R. to Mine La Motte, Mo. Address Gen. Mgr. A. J. Meier, Mine La Motte Co., St. Louis, Mo.

1817—Toledo, Ohio—The Big Four Coal Co. is in the market for two cars of ¾-in. lump or egg coal per month, deliveries to continue until Apr. 1. Address General Manager The Big Four Coal Co., Toledo, Ohio.

1818—Chicago, Ill.—The Midland Linseed Products Co. will purchase its annual fuel requirements, involving approximately 5,000 tons Indiana screenings, in the open market. Address Pur. Agt. P. A. Brett, Midland Linseed Products Co., 927 Blackhawk St., Chicago, Ill.

1819—Chicago, Ill.—Byrne Brothers Dredging and Engineering Co. will contract for its annual fuel requirements, involving approximately 5,000 tons, some time during the early part of the year. Illinois lump coal is required. Address Pur. Agt. Schumaker, Byrne Bros. Dredging and Engineering Co., Chicago, Ill.

+1820—Somerset, Penn.—The Town Council will receive bids until 2 p.m., Dec. 28, for furnishing and delivering coal as may be required for the local pumping station and municipal building, during the ensuing year. Mine-run coal is required. Address Secy. C. E. Pile, Town Council, Somerset, Penn. (No. 467, Vol. 7, pp. 628, 750).

1821—Decatur, Ill.—The Staley Manufacturing Co. is receiving bids for furnishing its annual fuel requirements, involving approximately 150 tons of screenings per day. Address Supt. A. E. Chamberlain, Staley Mfg. Co., Decatur, Ill.

+1822—Williston, N. D.—Bids will be received until 8 p.m., Dec. 31, for furnishing the library building with lignite coal as may be required during the ensuing year. A certified check for $50 must accompany each bid, and the successful bidder will be required to furnish a bond for $200. Address Secy. H. G. Hanson, Library Bd., Williston, N. D.

+1823—Canton, Ohio—Bids will be received until noon, Dec. 30, for furnishing the local pumping station with No. 8 Pittsburgh nut and slack coal as may be required during the ensuing year. Bids must be made f.o.b. pumping station, and must be accompanied by a certified check for $200. All bids must be submitted on blank forms, which may be obtained on application. Address Dir. Z. W. Kent, Pub. Ser., Canton, Ohio.

1824—St. Louis, Mo.—The St. Louis Smelting and Refining Co. is in the market for its annual fuel requirements at the Collinsville, Ill., plant. About one or two cars per day of mine-run, lump and screenings are needed. Address Secy. J. A. Caselton, St. Louis Smelting and Refining Co., International Life Bldg., St. Louis, Mo. (No. 427, Vol. 7, p. 568).

1825—Willimantic, Conn.—Max Pollock & Co. at this place usually contract for its annual fuel requirements, involving approximately 60 tons per month, some time in February. The company has storage capacity for 400 tons, and deliveries are made by railroad and wagon. Address Purchasing Agent Max Pollock & Co., Willimantic, Conn.

1826—Chicago, Ill.—The Illinois Improvement and Ballast Co. will purchase its requirements, involving five or six cars of Indiana 4th and 5th vein lump, Montgomery and Marion County, Ill., lump per month, in the open market. Address Pur. Agt. C. E. Celes, Illinois Improvement and Ballast Co., 298 S. La Salle St., Chicago, Ill.

1827—Conshohocken, Penn.—The Alan Wood Iron and Steel Co. is in the market for its annual fuel supply, involving approximately 500 tons of broken coal, deliveries to begin Jan. 1. Address Pur. Agt. A. D. Wood, The Alan Wood Iron and Steel Co., Widener Bldg., Philadelphia, Penn.

1828—Kansas City, Mo.—The Ford Laundry Co. at this place has abandoned the use of oil, and will require approximately 100 tons of coal per month. No permanent contract has as yet been negotiated. Adress purchasing Agent The Ford Laundry Co., Kansas City, Mo.

1829—Philadelphia, Penn.—The St. Timothy's Hospital is receiving bids on its annual fuel contract, involving approximately 1,000 tons of pea coal, deliveries to begin Jan. 1. Address Secy. J. V. Merrick, St. Timothy's Hospital, Wissahickon, Philadelphia, Penn.

1830—Ft. Wayne, Ind.—The Evans Coal Co. at this place is in the market for approximately 150 cars of 4-in. or 6-in. Ohio, West Virginia or Kentucky mine-run coal, delivery to be made between Jan. 1 and Apr. 1. Address Purchasing Agent The Evans Coal Co., Ft. Wayne, Ind. (No. 1670, Vol. 8, p. 912).

1831—Philadelphia, Penn.—The Philadelphia Warehouse and Cold Storage Co. is in the market for its annual fuel supply, involving approximately 8,500 tons of buckwheat coal, delivery to be made during the year beginning Jan. 1. Address Secretary Philadelphia Warehouse and Cold Storage Co., Delaware Ave. and Noble St., Philadelphia, Penn.

1832—Wilmington, Del.—The Lobell Car Wheel Co. is in the market for its annual fuel supply, involving approximately 2,000 tons of broken coal per annum, deliveries to be made during the year beginning Jan. 1. Address Purchasing Agent, Lobell Car Wheel Co., Wilmington, Del.

1833—Kansas City, Mo.—The Speth's Domestic Laundry will return to the use of coal on Jan. 1, and will be in the market for tonnage equivalent to 500 bbl. of oil monthly. Address Purchasing Agent Speth's Domestic Laundry, Kansas City, Mo.

1834—Philadelphia, Penn.—The Wabash Mills Co. is conducting a series of tests with a view to substituting anthracite buckwheat coal for bituminous, which they have been using for a number of years past. If satisfactory results are obtained from the tests, about 1,000 tons of coal will be required which will be purchased on a contract, becoming effective Jan. 1. Address Purchasing Agent Wabash Mills Co., Manayunk, Philadelphia, Penn.

+1835—Philadelphia, Penn.—The City Government will receive bids until Dec. 29 covering its annual fuel requirements during the year beginning Jan. 1. Address Dir. Herman Loeb, Dept. of Supplies, City Hall, Philadelphia, Penn. (No. 22, Vol. 6, p. 933; No. 1516, Vol. 8, pp. 577, 660; No. 1573, Vol. 8, pp. 699, 828; No. 1650, Vol. 8, p. 871).

1836—New Castle, Del.—The American Manganese Steel Co. is in the market for its annual fuel requirements, involving approximately 1,000 tons of broken coal, deliveries to begin Jan. 1. Address Pur. Agt. N. C. Peebles, American Manganese Steel Co., McCormick Bldg., Chicago, Ill.

1837—Philadelphia, Penn.—The Kingan Provision Co., packers, usually contract for its fuel requirements, involving approximately 1,200 tons of anthracite buckwheat coal per annum, about Jan. 1. Address Purchasing Agent Kingan Provision Co., 8th and Willow St., Philadelphia, Penn.

+1838—Fort Benton, Mont.—The Choteau County Commissioners will receive bids until 10 a.m., Jan. 3, for furnishing coal as may be required at the Court House and Jail during the ensuing year. Address Clk. Lester M. Bond, Bd. of County Comrs., Fort Benton, Mont.

1839—Graniteville, S. C.—The Graniteville Manufacturing Co. usually contracts for its annual fuel requirements, involving approximately 500 tons of Pocahontas mine-run steam coal per month in February. Deliveries are made by railroad, and the company has a storage capacity for 1,500 tons. Address Supt. W. A. Giles, Graniteville Manufacturing Co., Graniteville, S. C.

1840—Philadelphia, Penn.—Hance Bros. & White, manufacturer of drugs, is in the market for its annual fuel supply, involving approximately 1,000 tons of anthracite buckwheat and rice coal. Address Purchasing Agent Hance Bros. & White, Willow and Marshall St., Philadelphia, Penn.

1841—Kansas City, Mo.—The Ideal Laundry at this place has abandoned the use of fuel oil, and will require approximately 100 tons of coal per month. It is understood that there is no permanent contract as yet. Address Purchasing Agent The Ideal Laundry, Kansas City, Mo.

1842—Philadelphia, Penn.—The Niles-Bement-Pond Co., machine manufacturers, will contract for its annual fuel supply, involving approximately 900 tons of steamboat coal, about Jan. 1. Address Purchasing Agent Niles-Bement-Pond Co., Nicetown, Philadelphia, Penn.

1843—Gloucester, N. J.—The Welsbach Co., manufacturer of gas mantles, will contract for its annual fuel requirements, involving approximately 1,000 tons of anthracite broken coal, about Jan. 1. Address Purchasing Agent Welsbach Co., Gloucester, N. J.

1844—Philadelphia, Penn.—Collins & Aikman Co., paper manufacturer, will contract for its annual fuel requirements, involving approximately 1,500 tons of buckwheat coal, about Jan. 1. Address Purchasing Agent Collins & Aikman Co., Manayunk, Philadelphia, Penn.

+1845—Omaha, Neb.—The City Government will receive bids until 10 a.m., Dec. 28, for furnishing approximately 2,000 tons of Cherokee Kansas nut, 1,000 tons of steam, and several other grades in smaller amounts, deliveries to be made both by wagon and carloads, and to begin Jan. 1. Address City Clk. T. J. O'Connor, Omaha, Neb.

1846—Princeton, Ind.—The Gibson County Commissioners will receive bids until Dec. 27 for furnishing the fuel requirements for the county during the ensuing year. Address Aud. W. T. Roberts, Gibson Co., Princeton, Ind.

1847—Mare Island, Calif.—The Navy Department is in the market for 300 tons of coke for delivery at the Navy Yard at this place. The purchase is being negotiated under schedule No. 9147. Address Paymaster General of the Navy Samuel McGowan, Washington, D. C.

Contracts Awarded

Note—Successful bidders are noted in **bold face** type.

1660—East St. Louis, Ill.—This contract (p. 911), which provides for furnishing the Obear-Nester Glass Co. with its annual fuel requirements, involving a total of about 400 tons per week, has been awarded to the **E. F. Wickham Coal Co.;** the contract for the steam coal, involving about 100 tons per week has been sublet to the **Lenz Coal Co.** The coal for the gas producer, about 300 tons per week, will be supplied from the Wickham mine at Duquoin. Address Supt. Jos. Nester, the Obear-Nester Glass Co., East St. Louis, Ill.

+1667—Ironton, Ohio—The readvertisement for bids on this contract (pp. 912, 998), which provides for furnishing the coal requirements for the local pumping station during the ensuing year, brought out the following bids: **Andrew Geil**, clean lump, $1.90; lump, nut and pea, $1.70; mine-run, $1.50. Wm. W. Sites, clean lump, $1.84. The contract was awarded to **Andrew Geil** on his bid of $1.70 for lump, nut and pea coal. Address Clk. F. A. Ross, Public Service, Ironton, Ohio.

1668—St. Louis, Mo.—This contract (p. 912), which provides for furnishing the St. Louis Car Co. with approximately 125 tons of nut coal per week, has been awarded to the **Devoy & Kuhn Coal Co.** The contract will expire on Apr. 1. Address Pur. Agt. E. B. Meissner, St. Louis Car Co., St. Louis, Mo.

1691—St. Louis, Mo.—This contract (p. 957), which provides for furnishing the American Paper Products Co. with its annual coal supply, involving approximately 200 tons of 1¼-in. screenings per month, has been awarded to the **Mt. Olive & Staunton Coal Co.** It is understood that an extra supply of storage coal will be furnished to the company under this contract to provide against a suspension of mining operations Apr. 1. Address Pur. Agt. Pollock, American Paper Products Co., St. Louis, Mo.

+1696—Elmira, N. Y.—This contract (p. 957), which provides for furnishing the local Water Board with approximately 2,000 tons of bituminous mine-run during the ensuing year has been awarded to the **Ralston Coal Co.,** at $2.25 per ton. Address Gen. Mgr. H. M. Beardsley, Water Board, Elmira, N. Y.

1726—Elkhart, Ind.—This contract (p. 999), which provides for furnishing the Elkhart Bristol Board and Paper Co. with approximately 3,500 tons of mine-run coal, has been awarded to the **Wyatt Coal Co.** Address Pres. C. E. Frye, Elkhart Bristol Board and Paper Co., Elkhart, Ind.

1756—Delphos, Ohio—The contract of the Delphos Gas Co. (p. 1043), is covered until Dec. 1, 1917. The contract involves 2,500 tons per annum instead of 600 tons as previously noted. Address Pur. Agt. W. M. Moran, Delphos Gas Co., Delphos, Ohio.

Contract Notes

East St. Louis, Ill.—Carter Brothers have contracted with the **Lumaghi Coal Co.** for 350 tons of "Cantine" 6-in. lump per month.

St. Louis, Mo.—The Thos. Ryan Coal Co. has contracted with the Southern Coal, Coke and Mining Co. for a tonnage of New Baden lump coal.

St. Louis, Mo.—The Weisenborn Coal Co. has awarded the **Searles Coal Co.** a contract covering its requirements of Illinois high grade McClintock coal.

Belleville, Ill.—The Belleville coal dealers have announced that no more coal will be sold on credit, due to the heavy losses that have been sustained from this cause.

St. Louis, Mo.—The Missouri Can Co. have contracted with the **Taylor Coal Co.** for 250 tons of "Energy" screenings per month. Address Pur. Agt. F. M. Payne, The Missouri Can Co., St. Louis, Mo.

St. Louis, Mo.—The Vanadlia R.R. Co. has begun storing 20,000 tons of lump coal at the Rose Lake yard in East St. Louis. The coal is being furnished by the **Lumaghi Coal Co.,** and the **Consolidated Coal Co.**

Chester, Penn.—The Keystone Plaster Co., at this place is experimenting with fuel oil and if successful they will discontinue the use of anthracite coal. Address Pur. Agt. Keystone Plaster Co., Chester, Penn.

Charleston, W. Va.—Press reports state that the Imperial Coal and Coke Co. and the Christian Colliery Co. have closed a contract with a Middle Western manufacturing concern, involving 120,000 tons, deliveries to be made during the year beginning Apr. 1.

Cincinnati, Ohio—The Peters Cartridge Co. has contracted with the **Wyatt Coal Co.** for 5,000 tons of West Virginia egg coal for delivery at the Kings Mill plant during the ensuing year. Address Pur. Agt. G. W. Collins, Peters Cartridge Co., Cincinnati, Ohio.

Granite City, Ill.—The contract of the National Stamping and Enameling Co., will be filled on 2 in. screenings instead of 1½ in. as previously announced (p. 959). Address Pur. Agt. R. C. Lutton, National Enameling and Stamping Co., Granite City, Ill.

Louisville, Ky.—The contract of the Louisville Ry. Co. (p. 1,045), involving over 100,000 tons of pea and slack coal per annum, does not expire until March, 1917. Address Supt. of Motive Power, F. H. Miller, Louisville Ry. Co., 326 W. Jefferson St., Louisville, Ky.

Harrisburg, Ill.—The Southern Illinois Railway and Power Co. consumes approximately 10,000 tons of special nut coal per annum. The company has a six-year contract and deliveries are made daily over their own lines. Address Pur. Agt. C. F. Richardson, Southern Illinois R.R. and Power Co., Harrisburg, Ill.

Baltimore, Md.—Press reports are to the effect that the Elkhorn Coal Corporation has concluded a deal with the United States Steel Corporation involving between 5,000,000 and 7,000,000 tons of coal for the steel company's plant at Gary, Ind. Deliveries are to be made during the next three years or more.

St. Louis, Mo.—The contract for furnishing the New Standard Adding Machine Co. with approximately 100 tons of coal per month has been awarded to the **Polar Wave Ice and Fuel Co.** on Standard 2 in. lump coal. Deliveries are made by wagon. Address Pur. Agt. J. M. Anderson, New Standard Adding Machine Co., St. Louis, Mo.

Selma, Ala.—The Selma Lighting Co. consumes approximately 6,000 tons of nut and slack and 3,000 tons of No. 2 in. lump coal per annum, deliveries being made by railroad at the rate of about 700 tons per month. The company has storage capacity for 1,500 tons. Address Pur. Agt. R. L. Ellis, Selma Lighting Co., Selma, Ala.

Moncton, N. B., Can.—The Moncton Tram Electric and Gas Co. consumes about 7,500 tons of screened nut coal per annum, deliveries being made by railroad at the rate of approximately 600 tons per month. Purchases are confined to the open market and the company has a storage capacity of 1,000 tons. Address Pur. Agt. A. B. Coryell, Moncton Tram Electric and Gas Co., Box 23, Moncton, N. B., Can.

Eagle Pass, Tex.—The Olmos Coal Co., has received a number of large orders for coal to be delivered in various parts of Mexico. Deliveries have recently been impossible due to the revolution but conditions are now being rapidly restored to normal. It is understood that the company has orders for at least 50,000 tons. The Carranza Government has announced that no import duty will be charged on coal.

Glad to Hear
This Interested You

BELOW will be found brief answers to some of the questions asked during the meeting of the Coal Mining Institute held at Fairmount, W. Va., Dec. 8 and 9, 1915.

This Locomotive Operates on an 18% Grade.

WHY two trolley poles? Using polyphase currents require two poles and a ground.

Does it consume more power than an ordinary locomotive? Conditions being the same the power consumed would be less, because this locomotive weighs less than any kind of wheel traction locomotive.

What protects it from running away should the power go off? Mechanical grip brakes.

What extra track equipment is required? A secondary motor member between the rails, normally about 3″ wide.

What is the maximum tonnage handled by this locomotive? Any desired pull or push can be developed, depending on the size of the motor elements. For heavy grades inside a mine, an articulated locomotive, consisting of two or more small units coupled together, is recommended, these to be used separately on level grades.

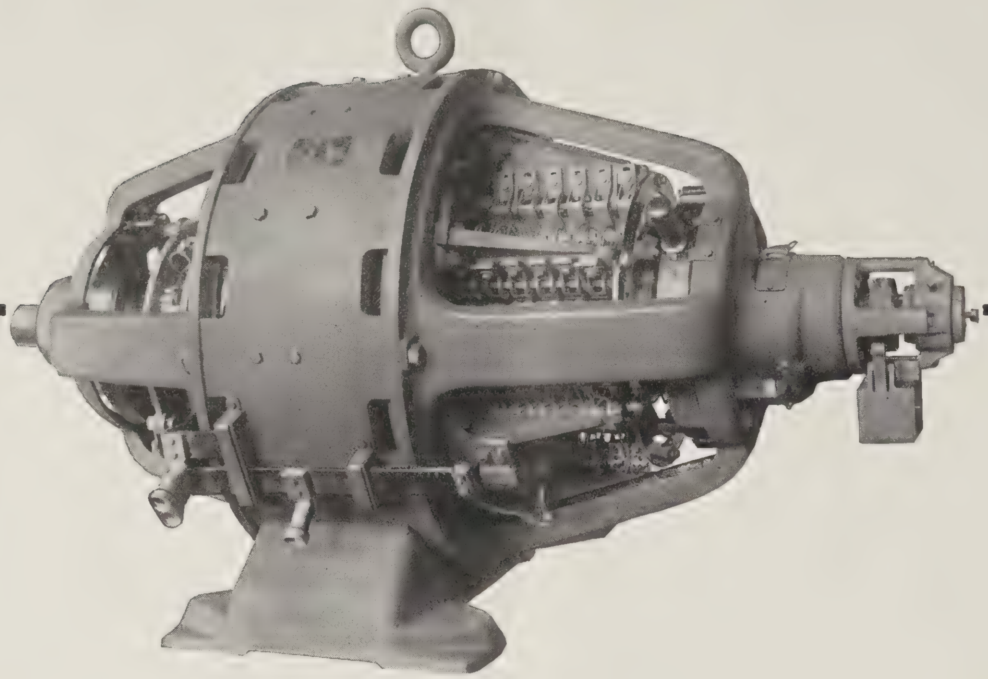
Does it require technical electrical knowledge to operate it? No. On account of its simplicity, less experience is required than with other locomotives.

Is 18% the maximum grade it will operate on? L. B. Stillwell and H. S. Putnam, after testing the operation on a 20% grade, reported: "As nearly as could be observed, the speed was maintained practically uniform throughout. . . . It is entirely possible to ascend extremely heavy grades without difficulty. . . . It would be impossible to climb a 20% grade with any system using electric motors installed on the car."

On account of the ability of this system to push or pull cars in and out of the rooms on both sides of the entry, regardless of the pitch of the vein, its use would in most cases saves the necessity of driving every alternate entry.

Tell us your conditions—amount of traffic, grades, operating requirements, etc.—and let us show you what the Electric Carrier can do for you

Electric Carrier Company, 220 Broadway, New York



—For Mining Service—

New Westinghouse Commutating-Pole Rotary Converters

Combine absolute reliability with the highest efficiency ever obtained on rotary converters of equal capacities. They are built especially for mining service, and will hang to the load in spite of violent fluctuations and will avoid delays due to shutdowns.

These Westinghouse rotary converters require less floor space and less head room than rotaries of any other type. This permits their being located underground and the power cables which supply them, run down through a shaft. The commutating-pole construction permits them to carry heavy overload without sparking.

One company thinks so well of them that they have ordered 24 at one time to improve their operating conditions.

Let our coal mining power expert study your conditions and tell you how to secure the best power conditions.

FOREWORD—NEVER AGAIN! **1047**

Some remarks concerning the making of New Year resolutions. It is pointed out that it is the keeping and not the making of good resolves that is important. Tabulate your worries and proceed to eliminate the cause of them.

*SEALING OFF MINE FIRES **1048**

By Joseph Cain

Fires usually originate at the working face. If they have gained headway, they may become inaccessible and must be sealed off. The construction of the seals as well as their ultimate removal requires great care and vigilance. COAL AGE, Vol. 8

*A WEIGHT-OPERATED SWITCH **1050**

FUTURE MINING PLANTS FROM THE ENGINEER'S STANDPOINT **1051**

By O. G. Petersen

The keynote of future installations will be simplicity. The elimination of all unnecessary appliances, and particularly the avoidance of superfluous parts in necessary equipment, will do much to lessen the cost of the mine output, as well as increase the safety of the operative. COAL AGE, Vol. 8

*SILENT CHAINS IN VENTILATION **1052**

WEST VIRGINIA COAL-MINING INSTITUTE **1053**

A successful meeting at which nine interesting papers were read was held in Fairmont, W. Va., on Dec. 8-9. COAL AGE, Vol. 8

*PROJECTION OF A PANEL MINE **1061**

By Guy E. Greer

A properly designed panel system provides a large tonnage from a small working area, largely prevents squeezes and localizes them if they occur and provides an ideal ventilating system. COAL AGE, Vol. 8

*CONTINUOUS FACE HAULAGE **1063**

By J. F. K. Brown

A system of rope haulage is here described that is continuous, handles about 600 tons per day and may be easily advanced as the workings progress. COAL AGE, Vol. 8

RELATION OF THE MINE OFFICIAL TO THE CONSUMER **1065**

By R. Z. Virgin

The mine official should view the coal sales from the viewpoint of the consumer, and he would then be more careful in supplying well-prepared coal of a size such as the consumer desires, and tight, clean and easily unloaded cars delivered regularly as ordered. COAL AGE, Vol. 8

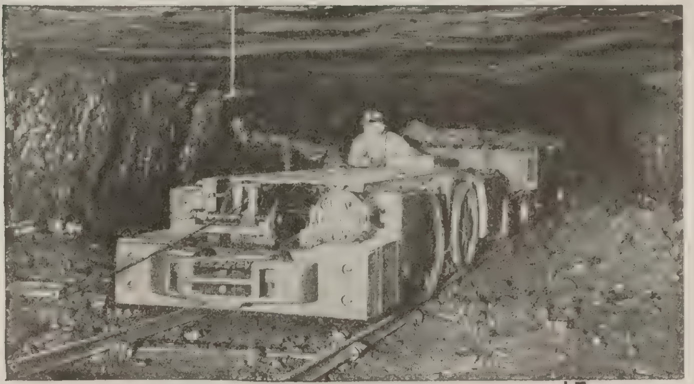
THAT *Happiness*
and Prosperity
may be yours during
1916 *is the Christmas*
wish of COAL AGE

How Are Your Haulage Conditions?

Are your expenses for men and mules shooting skyward? Are your workings congested? Do you feel that your present motor haulage is costing too much?



If there is any question in your mind as to whether your haulage conditions could be bettered, consult with the Jeffrey Engineers. Put the problem squarely up to them and learn whether or not we could help reduce the cost of your output.

The chances are we can—not only does Jeffrey equipment operate with the utmost economy but we are in a position to really *select* the best locomotive for you, as we make many special machines in trolley and storage battery types.

For Better Loading—
TRADE MARK REGISTERED FAIRMONT Car Retarder

Easily attached to tipple—cars moved under complete control just as far as wanted, making better loading and less spilling. The car retarder is self-winding and generally does away with one man at the tipple—paying for itself in short time. **Write for Bulletin 10 with further particulars.**

TRADE MARK REGISTERED
FAIRMONT
Mine Specialties

Fairmont Steel Mine Ties—One size tie fits three sizes of rail—strongest, safest means for adding jumper rail.

Power Coal Auger—Mounts on undercutting machine. Driven from machine motor.

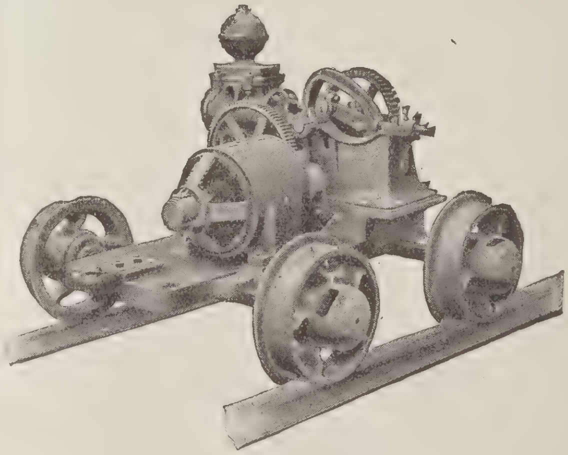
Box Car Loader—Car Hauls—Tipple and Conveying Equipment.

Write for further data on any of these subjects.

TRADE MARK REGISTERED FAIRMONT Portable Electric Mine Pump Takes Care of Itself

Again it is simply a case of a machine built to meet certain conditions and built right. This portable pump can be run out in the morning—put to work and never touched until night. As one manager puts it "All they get is a little oil or grease now and then."

Of course, there is a reason for this day in, day out service—every part of the Fairmont Pump that could be hurt by mine water is made of heavy acid-resisting bronze



Other facts too, make this particular pump of vital importance to you. Write for bulletin No. 13.

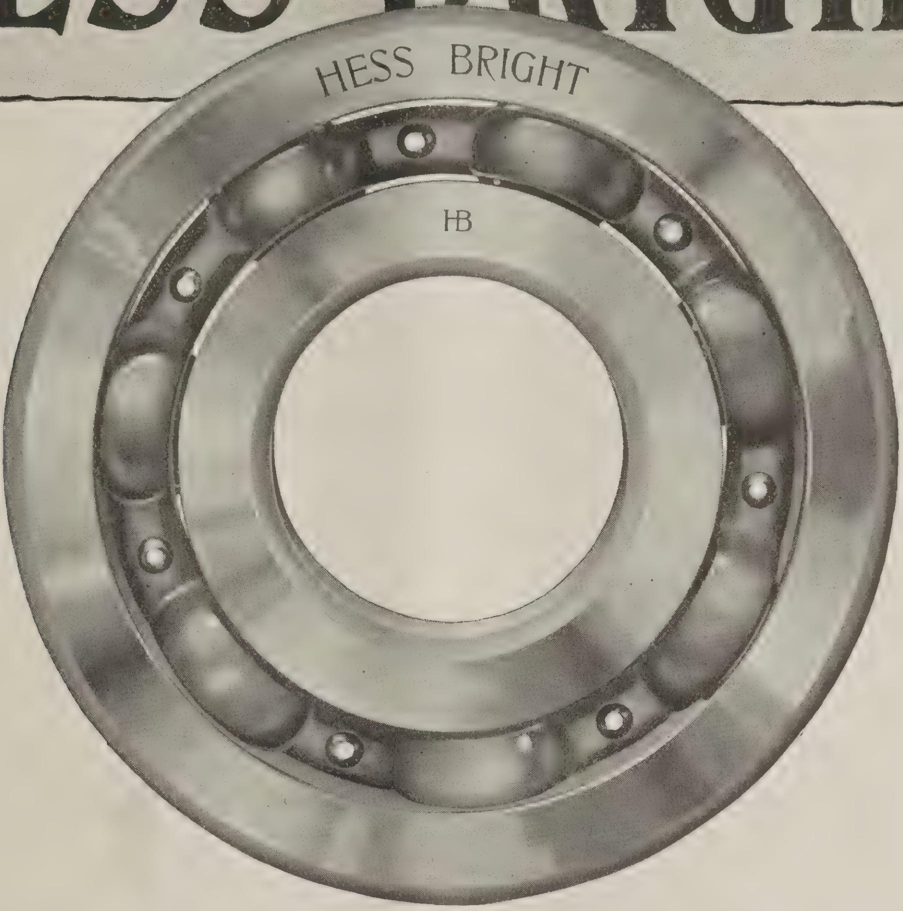
HESS-BRIGHT

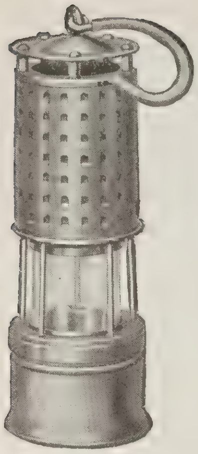


It is unjust to the expensive design, material and workmanship of a mine locomotive to equip it with inferior bearings. Inferior bearings put the whole locomotive in a bad light —increase its upkeep, decrease its reliability. Wherefore the importance of choosing HESS-BRIGHTS.

The Hess-Bright Manufacturing Company
PHILADELPHIA, PA.

The attention of the trade is called to the fact that HESS-BRIGHT'S Conrad Patents have been thoroughly adjudicated.

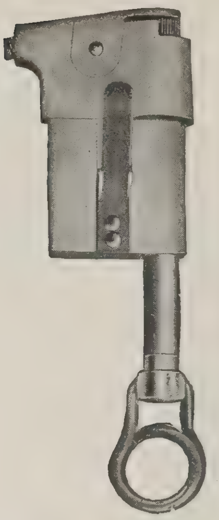
The Inimitable Bearing



Made in America

KOEHLER SAFETY LAMP

An American Company—



The Gas-Detecting SAFETY Lamp is a Necessity—

And the Koehler Standardized Lamp is an economy whereas electric lamps might prove an expensive luxury—

The Koehler Company can supply immediately any and every Safety Lamp requirement.

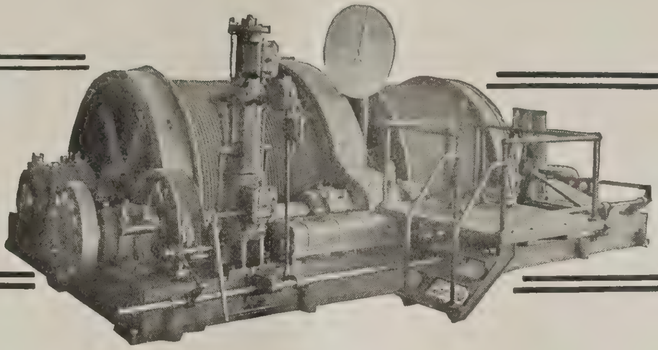
Koehler Lamps Koehler Pyro Igniter
Koehler Wax Tape Igniter
(Free burning and practically smokeless)

We want to make it exceptionally easy for you to adopt the *Safety* system. What lamps are you using now? We have an Exchange Proposal to make you. Other leading mines have adopted our plan for standardizing their lamp equipment with immediate and continuous profit to themselves. Why not you?

Write for catalogue and particulars.

Koehler Manufacturing Co., Marlboro, Mass.

Sales Office: 541 Fourth Avenue, Pittsburgh, Pa.



Buying Hoists is Buying *Transportation*

Suppose you are going from Someplace, N. Y. to Somewhere, Cal., and have five routes from which to choose.

Naturally, you want the very best route and train service, with a reputation for speed, punctuality and reliability. When you have satisfied yourself, you'll probably buy your transportation over the route that looks best to you.

Some people defer their choice to the last minute, and then rush up to the Slow & Lonely's ticket window, and dash for the train, without even knowing whether or not there's a diner.

Pretty much the same condition—only in a larger sense—confronts a man buying hoists; for hoists are transportation.

Any old last-minute hoist won't do in the long run. It's more than just a question of enough power.

Rather start earlier and investigate among the reputable builders.

Our engineering department will gladly assist in this investigation, and prepare special designs if necessary.

Do this—you'll get there faster in the end.

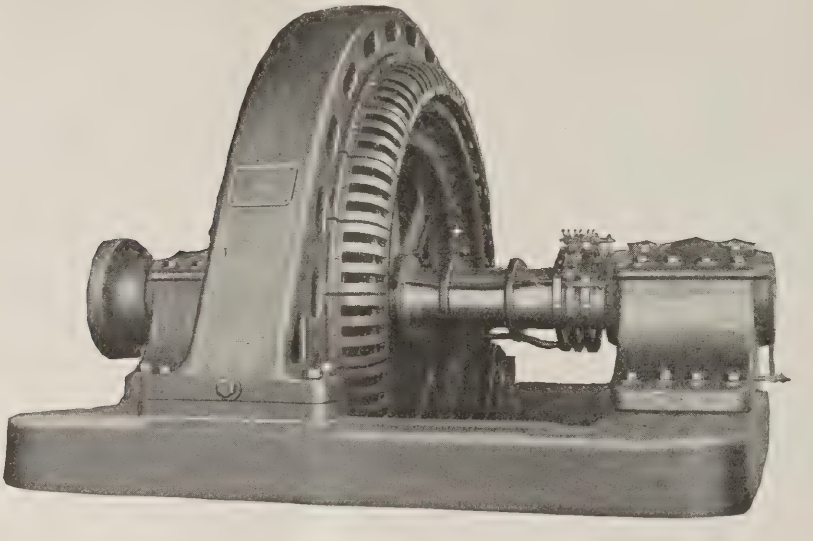
Motor Agencies in all large cities and towns.



Over twice as large as any A. C. hoist motor in America

An 1800 h. p. G-E alternating current hoist motor and control equipment has been ordered by the Tennessee Coal, Iron and Railroad Co. for the following duty:

Hoist unbalanced.	
Length of haul (maximum)...............	5280 ft.
Angle between shaft and horizontal (average) approx..............................	40 per cent.
Weight of skip or cage..................	13440 lbs.
Weight of ore per trip..................	26880 lbs.
Size of rope............................	$1\frac{3}{8}''$
Diameter of drum.......................	12 ft.
Average rope speed in feet per minute.....	2700 R.P.M.
Time for acceleration.....................	15 sec.
Time for constant running (5280 ft. level)..	106 sec.
Time for retardation.....................	8 sec.
Rest period (loading)....................	30 sec.
Number of tons (long) per hour (max.)....	150
Number of tons (long) per hour (average)..	100

Complete bulletins describing mine hoist equipment will be sent on request

General Office: Schenectady, N. Y. 5727

CORE CALYX DRILLS

5-inch cores from a 1400′ borehole made by a Colorado Coal Prospector.

Mr. Julius K. Monroe, Chief Engineer of Morgantown & Kingwood Railroad Co., wrote as follows:

"*We have been paying from $2.00 to $2.25 per foot for diamond drill work with very unsatisfactory results. Since we have been operating the drill (Calyx Class F-1) ourselves, cost will run from $1.00 to $1.15 per foot, including fuel, water, expense of moving, shot, etc. Quite a saving.*

The drill referred to above was used for coal prospecting at Kingwood, W. Va. It cut about 20 feet per day through sandstone and from 10 to 15 feet in very hard quartz conglomerate. Mr. Monroe purchased also two other "Calyx" Drills, for making soundings for a hydroelectric plant."

CALYX DRILLS REDUCE CORE DRILLING COST

The "Calyx" Core Drill produces perfect cores even when penetrating broken rock and crevices.

No substance is too hard for the "Calyx" Drill. Granite, taconite, jasper and even corundum rock has been cored successfully with the "Calyx." It employs chilled shot for cutting hard rock.

Among the softer materials which have been cored with this drill are clay, shale, coal, slate, sandstone, limestone and marble. A multiple-toothed steel bit is used for the softer materials.

The secret of its economy lies in the speed with which the "Calyx" Drill penetrates the ground and the low cost of sharpening cutters and replacing worn shot.

The "Calyx" Drill gives a double record—the solid core and the cuttings, which are retained in a suitable condition for assay purposes.

The "Calyx" Core Drill is made in a complete range of sizes, styles and for various modes of drive to cut cores from $1\frac{1}{2}$ to 19 inches in diameter and from all depths to 4000 feet.

If interested in core drilling, you should not fail to send for a copy of New Catalog No. 9201. It contains a fund of information on this subject.

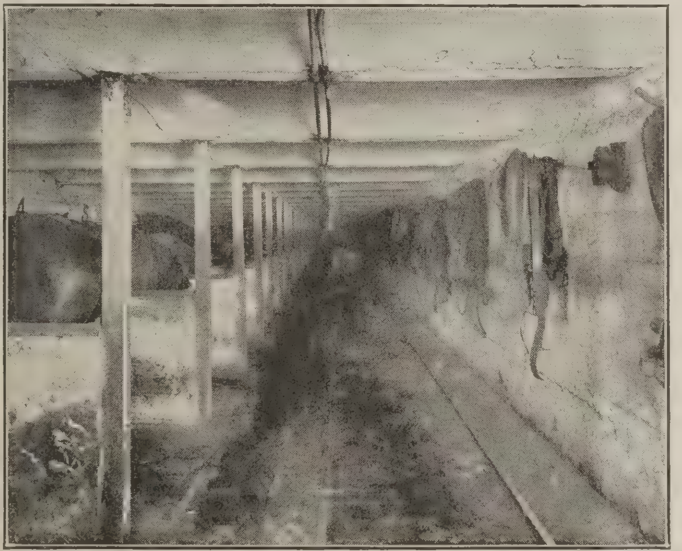
Steel for Service



When a mine owner pays high prices for horses and mules it is proper for him from economic considerations as well as for their own sakes to provide them with good quarters.

The photograph shows an underground stable in the construction of which

Steel Mine Timbers

were used. It will be in good condition when the mine is finally abandoned.

Safety and welfare always go hand in hand with economic expenditure when scientific mine operation leads the way.

The mark of quality CARNEGIE It protects the user

ANSWERS addressed to us at 10th Ave. and 36th St., New York or 1144 Monadnock Block, Chicago will be forwarded without charge (excepting circulars or similar literature).

IMPORTANT: Original letters of recommendation or other papers of value should not be enclosed to unknown correspondents—send copies. Advertisers' names will not be furnished under any circumstances. Copy received until 10 A.M. Monday for following Saturday's issue. A

POSITIONS WANTED

DESIRE OPPORTUNITY for further advancement; now managing branch office selling electrical machinery; have technical education and eight years' general experience; can qualify for advertising manager, purchasing agent or other responsible position. PW507—Coal Age.

MINING ENGINEER open for proposition as manager or general superintendent for large coal-mining interest; extensive experience with large coal and coke operations in several states; references; can make small investment. PW504—Coal Age.

POWER PLANT ENGINEER OR ASSISTANT—Licensed man, thoroughly understanding—through experience—the care and operation of engines, boilers and auxiliary equipment; immediately available; location immaterial. PW499—Coal Age.

AS MECHANICAL ENGINEER, thoroughly experienced in the mechanical engineering of coal mines; ten years' experience in the design and operation of power plants and mining machinery. The combustion and selling of steam coals are my specialties. PW501—Coal Age.

MISCELLANEOUS

INVESTORS REPORTS a specialty; will advise on any mine work. Thomas C. Farus Worth, Civil Engineer, Sydney Mines, Nova Scotia.

BUSINESS OPPORTUNITIES

FOR SALE OR LEASE 240 acres, Cambria County Coal Lands near Patton Field. Further information on application. Signed, Samuel Heilner, Land Title Building, Philadelphia, Penn.

FOR SALE OR LEASE—Fully equipped domestic coal mine now operating capacity 250 tons; on G. T. P. Ry. at Three Hills, Alberta; nearest mine to Calgary; exceptional opportunity for practical coal operator. Union Coal Co., Limited, Three Hills, Alberta, Canada.

WE LOOK INTO THE EARTH by using diamand core drills

Equipment Wanted items appear at the end of this list.

ADVERTISERS' NAMES are abbreviated in most of these items. Complete names and addresses are as follows:
NEW RIVER Co., The, Macdonald, W. Va.

AIR COMPRESSORS

2 Laidlaw-Dunn-Gordon duplex 2 stage and 3 Norwalk tandem 2 stage, capacities 900 to 2100 cu.ft.—NEW RIVER.

FANS

Ventilating from 20x9 down to 10x4, d.c. to steam engines Clifford, Capell, Robinson and Bullock.—NEW RIVER.

1 Heavy construction, full housed mine fan, top horiz. discharge, overhung 10′ dia. wheel, complete with pedestal, thrust and outboard bearings and flywheel pulley; cap. 70,000 cu.ft. at 350 R.P.M.; as good as new and a bargain.—Aluminum Ore Co., East St. Louis, Illinois.

GENERATING UNITS

Generator sets direct current, 250 volt and 550 volt, direct connected and belted, capacities up to 250 kw.—NEW RIVER.

HAULAGE ENGINES

Tail rope and endless rope haulage engines.—NEW RIVER.

HOISTING ENGINES

Bargain—16x24 double cylinder, single drum direct-acting mine hoist; capacity 9,000 lb. at 750 ft. per minute; practically new.—Mead-Morrison Mfg. Co., 108-10 West Park Way, N. S., Pittsburgh, Penn.

LOCOMOTIVES

Electric—11 Baldwin-Westinghouse and Goodman, weights from 4 to 8 tons; 40″ and 44″ gauge.—NEW RIVER.

2 H. K. Porter dinkeys, 8½ and 10 tons, standard gage, good condition.—Jamison Coal & Coke Co., Oliver Bldg., Pittsburgh, Penn.

MINING MACHINES

Sullivan longwall, equipped with two 7x7 air engines, gage 40″, feed chain $\frac{9}{16}$x65′. In first-class condition and as good as new. Immediate delivery.—NEW RIVER.

4 Jeffrey, 27 B, 250 volt, 36″ gauge, self-propelling machines. Ten Pneumelectric 250-volt machines.—Reading Iron Co., Kimmelton, Pa.

PUMPS

High head. General service and boiler feed.—NEW RIVER.

RAILS

New and second-hand, all sections on hand for immediate shipment.—M. K. FRANK, Frick Bldg., Pittsburgh, Penn.

WANTED

One 3-ton, 250-volt mining locomotive, 36″ gage, outside wheels, side trolley pole connection, center bumper; one mile trolley wire with hangers; bonds for one-mile track.—W508—Coal Age.

ARE YOU SINKING A SHAFT?

If so, don't place your order for hoisting engines until you see what we offer for shafts up to 680 ft. deep, engines 22″ x 36″ up to 24″ x 48″. *Write for full list of equipment.*

THE THEW AUTOMATIC SHOVEL CO. LORAIN, OHIO

Marion
COAL STRIPPING SHOVELS

EXPERIENCED Coal Strippers often run into a piece of overburden a whole lot harder than their drilling showed. Such a condition cannot be foreseen, and can only be guarded against by providing shovel equipment that will stand up under emergency load.

The illustration below shows just what we mean by "emergency load." The Witch Hazel Coal Company, Youngstown, Ohio, owners of this Marion, will tell you that

It's Easy to Dig Ordinary Dirt—But it Takes a Marion to "Make" Hard Shale and Limestone

This particular operation is near Piney Fork, Ohio—just a few miles from the Ohio River. The upper part of the overburden, as the illustration clearly indicates, is of hard shale and the bottom solid limestone. Material such as this furnishes a real test of steam shovel service, and we are proud of the performance of this Marion.

To meet just such conditions, to solve the many problems in the constantly widening field of surface coal mining has been our aim—and will be. What we have accomplished, and what we can accomplish, *for you* is interestingly told in our little booklet, "Stripping Coal with Economy and Speed." Glad to send it to you if you ask for Catalog 91-L.

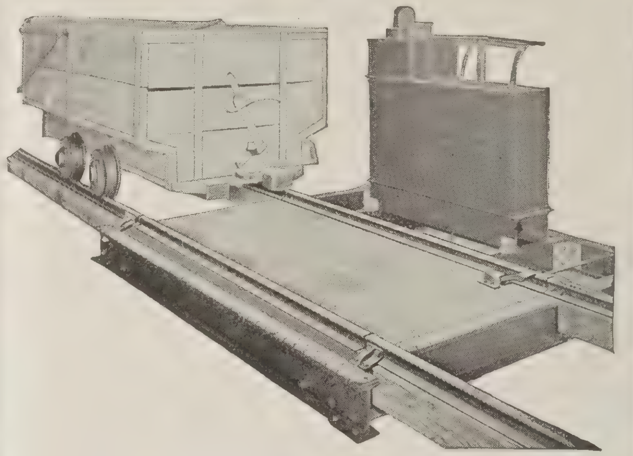
Weigh Your Tipple Cars in Motion



The Streeter-Amet Weight Recorder

makes this method absolutely accurate.

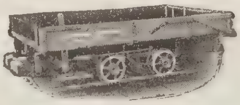
Eliminates the loss of time and money due to stopping each car on the scale.

Furnishes an absolute and indelible printed record of the weight of each car as it passes over the scale. Makes careless weighing impossible. Assures you that your tipple receives every ton of coal you pay for.

Your descriptive literature is now ready.

Streeter-Amet Weighing & Recording Co.
4101-05 Ravenswood Ave., Chicago, Ill.

"Automobile"



Mr Sanford-Day

Whitney Roller Bearing Wheels

"Trucks for cars now in use, or complete new cars will be furnished equipped with "Whitney" roller bearing wheels with the floating automobile type of axle. Your cars will then run from six to eighteen months one greasing. They will coast on a grade of one half of one per cent. By actual test in 20 car trips 58% of the electric haulage power is saved while doubling the speed of haulage. Used in a thousand mines, this Pioneer roller bearing wheel hasn't had a single worn out roller reported in the past seven years. It is absolutely fool proof and requires no attention. It has no cotters, gaskets, packing, key blocks, washers, or other parts requiring renewal. It will outlast two wheels of any other design or make. All wearing parts covered by written guarantee. Largest coal mines using them. Get our 160-page loose-leaf catalog No. 25 of wheels, cars, sheaves, dumps, tipples, switches and other mine equipment."

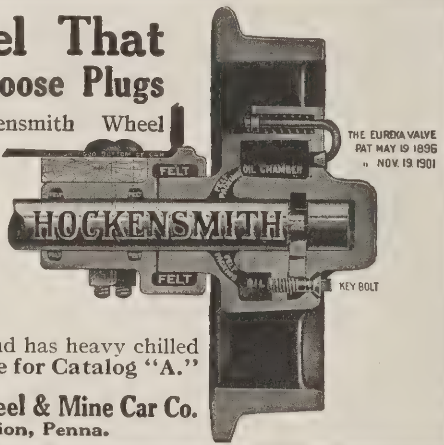
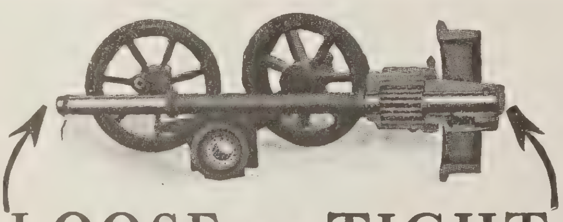
A Wheel That
Eliminates Loose Plugs



This new Hockensmith Wheel has solid closed Hub and Spring Valve Oiler. Note the straight spokes conforming to our usual high quality product. Wheel is thoroughly annealed and has heavy chilled tread. **Write for Catalog "A."**

Hockensmith Wheel & Mine Car Co.
Penn Station, Penna.



LOOSE or TIGHT

Why choose? Use both and derive the advantages of both with none of the disadvantages of either. Equip with Lobdell Tight and Loose Wheel Equipment with either Iron, Brass or "Hyatt" Bearings.

Full particulars on request

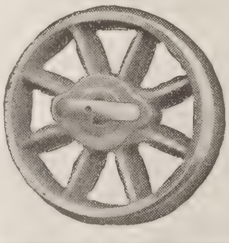
Lobdell Car Wheel Co., Wilmington, Del.

A Different Wheel

Here's a wheel that's easy to oil—that holds a large amount of oil—that is easily put on and taken off.

A wheel that gives real service.

Irwin Mine Car Wheel

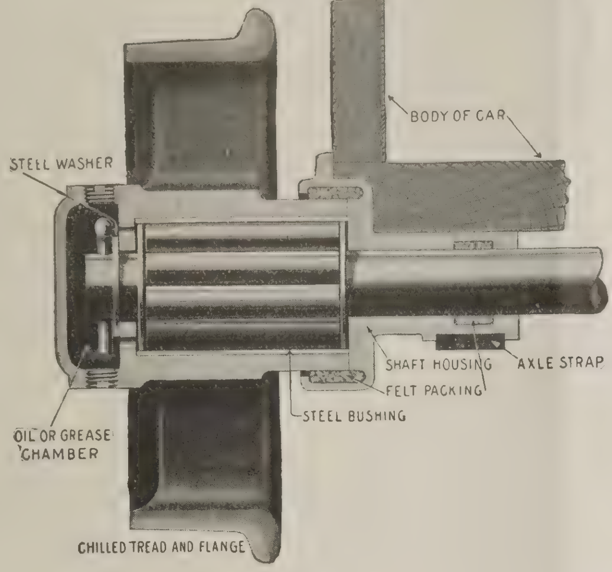


In this wheel the oil hole is located on center, the oil chamber is large. Features that mean ease of oiling and long time running on one oiling. The linch pin is always accessible—No trouble to remove wheel.

This wheel means smaller maintenance costs—better service. GET DETAILS TODAY.

Irwin Foundry & Mine Car Co.
Irwin, Pa.

"Ottumwa" Roller Bearing Car Wheels

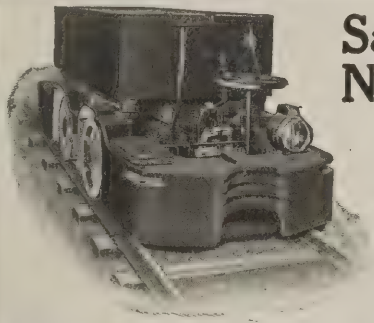


"Ottumwa" Roller Bearing Car Wheels represent the highest efficiency in modern car wheel development. They are so designed, and the iron is of such chemical analysis, that wheel breakage is almost unknown. Every wheel is fully guaranteed.

Cars equipped with the "Ottumwa" Roller Bearing Wheels will take 50% less power to pull them on a level track than is required for the ordinary style self-oiling wheels. They will require oiling only once or twice a year (no other attention is necessary) so that you save your oil bill, also the oiler's time.

Let us quote you on your next requirements. When ordering, give wheel diameter, track gauge and wheel base (distance from center to center of axle); also give the weight of the car and material.

OTTUMWA IRON WORKS, Inc., Ottumwa, Iowa



Save $2,000 Next Year

How? By sending your mules out to work on hillside farms and equipping your mine—above and below ground with

The Storage Battery Mule

Every one you buy may save $2,000 a year. No need for bonding rails or trolleys. Take our "Mule" to the working level and put it on the job. Its self-contained power will take it anywhere in your mine. That's all.

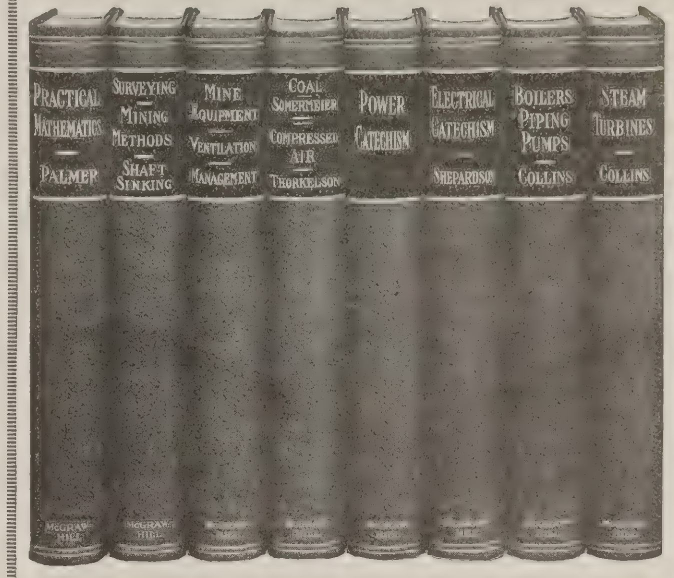
Woolworth Building
New York

COAL AGE SAYS:



"This handy grouping of interesting information bearing on coal-mining plant operation will be of interest to every mining man.* * *

"From the earliest days we have taken geology as the fundamental study of mining and harrowed our minds with all the freakish developments of a plant out of gear. But it is refreshing to see a book which realizes that the mine is a machine shop and not a classroom for field geology. The books mark an era—the passing of the mining man who regarded himself as a brother to the civil engineer and his replacement by one who looks at coal mining largely as a mechanical problem.

Chief Study in Mining is Machine Operation

"In fact it is time for mine managers to put aside the misconceptions fostered by early association and training and to treat the mining problem as a study of mining and not of coal hunting, surveying and mine gases, though these subjects have their value. But there is nothing so likely to keep us back in development as to have too large a stress laid in our training on the less essential elements."

Form your own opinion—

Perforated Steel Screen Plates

For Coal and Coke, Crushed Stone, Phosphate Rock, Gravel, Sand, etc.

¶ Cylindrical Screen sections rolled to diameter lap or butt joints, and fastened with clips, bolted or riveted —segments for Taper Screens rolled to diameter with bolt holes in margins.

¶ Flat screen plates of any dimensions to 10x20 feet to one inch thick for heavy work.

¶ Standard sizes of Round, Oblong and Square holes—special sizes made to suit.

¶ Manganese Bronze or Monel Metal screens for acidulated or sulphurous mine waters.

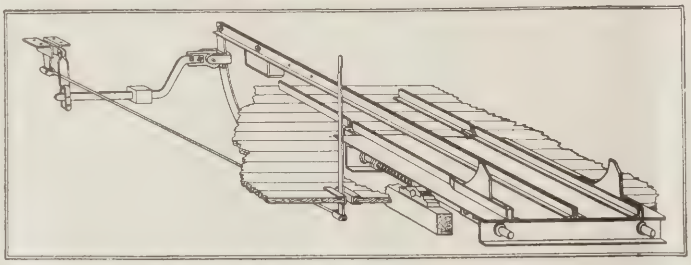
OUR sizes are standard centers (distance apart) but we can give you closer or wider spacing if required—in other words *you get what you want.*

The screens are made with care, exact to details of size, thickness and dimensions—in point of material and workmanship the best of their kind.

Please send detail specifications with your order or inquiry.

THE HARRINGTON & KING PERFORATING CO.
628 North Union Ave., CHICACO, ILL.
New York Office: 114 Liberty Street

You Can Dump Your Cars Rapidly



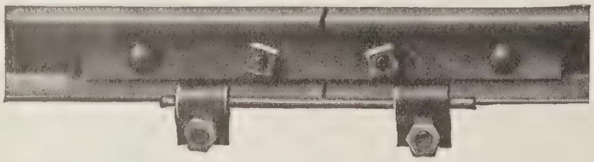
if your system includes

Ridge Spring Kick Back Dumps

A remarkable time-saving device that automatically pushes the dumped car back on the empty track with little effort on the part of the operator. Spring actuated. Makes it easy to dump the heaviest mine cars.

Very sturdy in construction. A necessity for the modern mine. **Write us for full particulars today.**

The Mineral Ridge Manufacturing Company, Mineral Ridge, Ohio



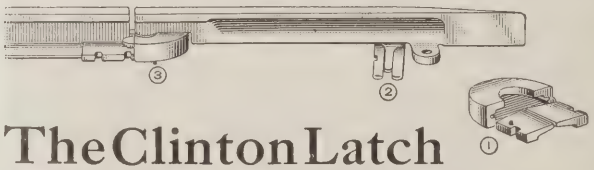
The ECONOMY Rail Bond

will end excessive rail drop in your mine by providing a highly efficient means of increasing the conductivity of the joints without the necessity of welding or soldering.

Gives over 6 square inches of copper to steel contact and may be attached and detached by unskilled labor. Used in many of the largest coal mines in the country.

May we send you full facts? Write for Bulletin now.

The Economy Rail Bond Co., Huntsville, Mo.



The Clinton Latch

A Good Latch, and we are ready to *prove* it. We first proved it to the General Manager of a western coal company, whose electric mine was suffering from track trouble. He ordered his men to get *good* latches—the kind that would stand up under his heavy haulage. They could not be found, **so the Clinton Latch was made**—so strong, so simple, so *good* that you cannot afford to be without it, even if your haulage isn't the heaviest. The Clinton Latch will save you money. **Ask us about it.**

Clinton Switch Company, CLINTON, IND.

Carnegie Steel Co., Pittsburgh, Penn. Export Representatives: United States Steel Products Co., New York, N. Y.

Bearings, Ball and Roller
Hess-Bright Mfg. Co., Front St. and Erie Ave., Philadelphia, Pa. Cable Address: "Hessbright." Manufacturers and distributors of Hess-Bright (HB-DWF) ball bearings. Hess-Bright ball bearings have continuous and uninterrupted raceways for the travel of the balls; they are self-aligning to the extent that they are applicable to all properly constructed machinery and shafting, but not to the extent of interfering with great radial and end thrust load capacities. Sizes and capacities, as well as list prices, cheerfully furnished upon application.
Irwin Fdry. & Mine Car Co., Irwin, Penn.
S K F Ball Bearing Co., 50 Church St., N. Y. C. Cable Address: "Skayef," New York.
All commercial sizes; capacities given by tables in catalog.
"S K F" are Swedish steel ball bearings, made at Gothenburg, Sweden. They are self-aligning bearings, permitting the shaft upon which they are mounted to deflect without binding the bearings. These bearings have a double-row construction, two rows of balls to each bearing, the balls being held in staggered relation in the raceways.

Sirocco Mine Fan at Pawama Coal and Coke Co., Matoaka, W. Va.

Sirocco

TRADE MARK.

Multi-Blade Mine Ventilating Fans

HIGHER economy in the ventilation of your mine follows the installation of Sirocco Multi-Blade Mine Fans because of the low resistance to the air in its passage through the fans. Less power is therefore required for delivering a given amount of air. Power savings as high as 20% over ordinary paddle wheel fans are quite usual.

The operation is very smooth and quiet. The initial high efficiency is indefinitely retained with very little attention.

Our mine ventilation engineers will gladly place their extensive experience at your disposal. Let them advise you. There is no obligation. Mine Fan Booklet No. 30,317 is yours for the asking. Write.

6000 Tons a Day

and no signs of wear

The largest sand and gravel plant in the country installed this belt in March, 1915.

No wear — no shut downs — that's service!

GOODRICH
Conveyor Belt

Maxecon brand, 36 in. wide, 6 ply, 450 ft. long, conveys sand and gravel at a 20 degree angle from trommel underneath track hopper to washing plant.

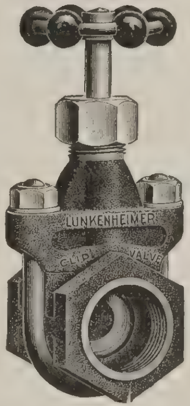
Conveyor, Elevator and Transmission Belts for any service.

Let us quote on your next installation.

The B. F. Goodrich Company

Factories: AKRON, OHIO **Branches in All Principal Cities**

Innovations — are usually viewed with doubt, though the LUNKENHEIMER "CLIP" GATE VALVE



by more than twenty years of satisfactory service and a constantly increasing demand, proves its practicability.

The differences from the ordinary type of Gate Valve still remain innovations, and the successful service has proven the merits we claim for them.

The steel "clip" which secures the hub to the body, adds strength and rigidity to the valve and facilitates taking apart for cleaning or repairs.

Has but few internal movable parts, viz.: stem and single, sharp-tapered, double-faced disc.

Indestructible joint between body and hub.

Made with Iron Body in sizes as small as ½-inch and has bronze inserted seats.

For handling cyanides and other acids which attack bronze, it is furnished in "all iron."

Material and workmanship of "Lunkenheimer Quality." Try them—you'll **adopt** them.

Repair Cracked Water Jackets with SMOOTH-ON Iron Cements No. 1 and No. 3

A cracked water jacket need not mean anything serious when a can of Smooth-On is nearby.

Repairing a cracked water jacket with Smooth-On Iron Cement No. 1 or No. 3 (according to requirements) is merely a matter of applying Smooth-On in the crack and letting it metalize.

Write for Smooth-On Instruction Book No. 15 and learn about all the uses for Smooth-On.

GANDY

Put in a GANDY Drive

JUST at this time, with the price of leather and rubber belting soaring upward, it is more than ever advisable to try

GANDY
Stitched Cotton Duck Belting

Consider the fact that for 37 years GANDY Belts have been steadily growing in popularity. They must have given the best of satisfaction.

This satisfaction is due to a combination of satisfactory service and low price. GANDY is water, oil and dust proof, grips the pulleys with a hard slipless hold, and *wears;* while its price is much less than you pay for leather or rubber.

Investigate. Write us today for sample and prices.

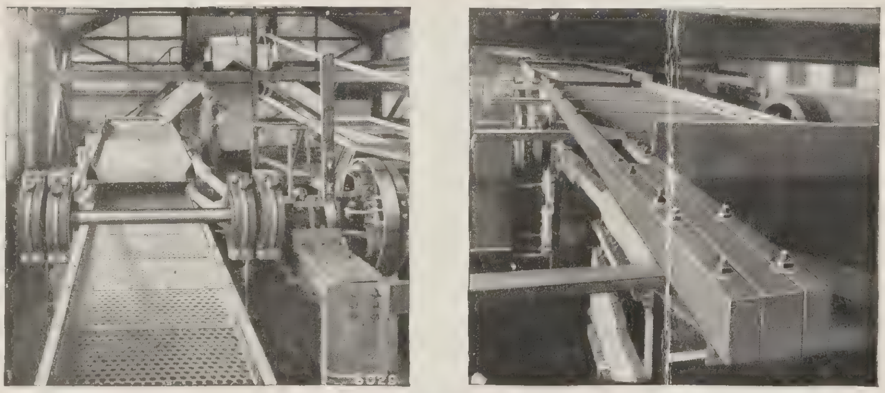
Link-Belt "Flexible Support" Screening Equipment.



Close views of Link-Belt "Flexible Support" screens, showing eccentrics and connecting rods. Carried on flexible legs, requiring no overhead structure.

Close views showing method of attaching flexible supports to screens and building structure. Light. Efficient. Guarantees perfect screening.

Correct Screening

The principles governing the correct screening of coal are elemental and simple. Take for instance lump coal as it comes from the mine cars and is dumped on the screen—the first real stage of preparation. If the screen inclines at the proper angle (see illustration) the coal has some natural downward movement by gravity, and with the assistance of a slight vibratory motion of the screen, the particles are kept in suspense as it were, the coal gently agitated, thereby permitting the particles to be correctly sized by passing through the proper perforations. The slow, uniform and continuous movement of the coal over the entire screening surface, tilting the screen just enough so that fine coal will not ride on the lumps, gives the ideal movement for thorough screening.

All Link-Belt Screens

are designed to fit their individual requirements—and they do.
